Range Rover Velar	Battery draining overnight.	Customer may report that after leaving the vehicle overnight the vehicle will require a jump start or the low battery warning may be illuminated. JLR is currently investigating an intermittent quiescent drain on these vehicles. These types of drains can be very difficult to diagnose if they are not currently faulting when at the retailer. If a Velar should come in with a low battery complaint, please report through EPQR or TA immediately. If the vehicle is found to be drawing excessively after shutdown, install a battery maintainer and open a TA case so diagnosis can continue while the fault is present.	TBD
