Comments:

I have a 2003 Jeep Liberty. I purchased it new. I am replacing a sensor in the engine for the second time since I have owned it. In the first two weeks of purchase it stopped cold on the highway at 60 mph. No warning! I was told it was a faulty part and it was replaced. Well, here I am again replacing another sensor in the engine a year later. Other Jeep owners have also experienced stalling without warning at high and low speeds. something is wrong here. It just a matter of time before someone is killed. I am getting no where with the dealership on this. I wrote a letter, I have e-mailed, I have asked two different dealerships to look at it. Please help!
