Washington, D.C. 20590.

Dear Administrator,

RE: ID No: 04v357000

I own a Daewoo Nubira year 2000. VIN # KLAJB52Z [REDACTED]

As per the Safety Recall Notice I received, regarding Camshaft Position Sensor defect, I took my car to the dealer. After inspection of my car, the supervisor said that it is not necessary to do any thing with the sensor. The reason he gave was that the part number does not fall in the list he has and if he does replace the part he will not be compensated by the Daewoo Company and I will have to pay for the part and the work carried out.

Is it true as to what he is saying?

Please Note:

1. My car's VIN # falls in the range 157058 to 778128 as prescribed in the Safety Recall Notice.
2. The Engine Check Light comes on all the time.
3. The Actron Super Auto Scanner CP9145 the OBD II Trouble Codes Reader invariably shows Codes: P0340 or P0342 which suggests Camshaft Position Sensor Circuit Malfunction or Circuit Low Input respectively.
4. I have driven many cars of different makes and models but never experienced car keys feeling hot when pulled out of the steering column after the car is driven.

All this is worrying me regarding the safety of my family and me.

I called up the Daewoo Customer Assistance Center Ph. No. (877) 362 1234 option 6 twice (within their working time period) and both the times machine came on saying "leave a message and ph. No. and will call back". But no body has called back. I have been waiting more than 10 days.

Please guide me in this matter as to what further action to take.

Thanking you,

Sincerely yours,
[REDACTED]
