I have a 2005 montana 5th wheel trailer with a Dometic Refrigerator model 2862 serial # 42303624 Product # 9211461-04. These Refrigerators are getting a Fatigue crack in the boiler tube which releases the pressurized coolant solution and may cause a Fire - I already know the Nat'l Hwy Traffic safety administration is aware of this. I just wanted to let you know that right after I had my Recall done my Refrigerator quit working due to "a Fatigue crack in the boiler tube" it cost me \$139.00 to get it repaired as Dometic would not be responsible even though they are aware that this is the "Real" Problem. The coolant that leaked out made my husband and I very sick. I have talked to several other RV owners that have the same identical problem we had. Dometic is calling it a "Safety Recall" not a "Fix the problem Recall" and it will continue to happen. What do you think all this leaking coolant is doing for our ozone.

Thank you
