RECEIVED - NHTSA

I'm 89 years old, and I find myself encountering great difficulties connecting the seat belt on our 2009 Camry. I have the same problem with most other autos. Some consideration should be given to seniors where seat belts are concerned. Auto manufacturers should extend the height of the buckle receptors in autos to enable seniors to more easily fasten their seat belts. It must be borne in mind that seniors experience restrictions due to age, and any accommodations offered would be most welcome. Injured veterans must also be considered. Along with seniors, veterans sustaining war injuries may be experiencing the same difficulties buckling seat belts. Your investigation into the matter will be greatly appreciated.
