Re: High Intensity blue automobile headlights are a hazard

Dear Sir or Madam:

I have serious concerns about the new type of auto headlights we are seeing increasingly on our streets. These **piercing blue tinted headlights** are way too intense for the safety of the oncoming drivers. I can tolerate one or two of these vehicles coming at me in a string of cars, but when the majority of vehicles has these it will be a nightmare to drive at night and face them.

The current "yellowish" color headlights are just fine. They allow excellent vision at night. There is no problem with them.

If these new headlights continue to proliferate I think there will be serious trouble on the road at night in the near future. They should be banned.
