RE: 2016 Toyota Camry Vin#4TiBFiFK7GU [REDACTED]

APR 13 2016

I purchased the above auto 10/15 at David Maus Toyota in Sanford FL. On the way home I noticed when I turned right on red and pressed the gas peddle quickly the motor did not respond and I had to hit the brakes quickly to avoid a wreck. Over several more weeks I noticed it continued to do this. I told my wife to be careful of this and she said she had noticed the same thing happening when she drove the car. Then it started doing the same thing when I changed lanes when I pressed on the gas peddle the car would not respond for several seconds. When you press down slowly on the gas peddle it seems to respond how ever if you are pressing on the gas ,let up then press on the gas it will not respond. I was on the interstate and the same happen the all of a sudden the car took off the RPMs went from 2000 to over 4000 instantly I almost hit the car in front of me. I have had several near misses from either the motor not responding or it responds quickly.

I had the auto serviced at the dealer who said the problem was the transmission was searching for a gear while it hesitated and was made to respond this way. I objected telling them we could get killed while waiting. I wrote Toyota with this problem and they said the same thing and that unless a lot of people complained they had no plans to do any thing. I am writing to you for help as this could get myself or my wife killed .

Thank You
