week." [redacted] said he was "coming up on a red light and there was a large crease or bump in the road."

"When my Prius hit the bump in the road the traction control systems kicked in, and at the same time the brakes felt unresponsive and the car felt as if it was accelerating or lunging forward," he said.

[redacted] said the he almost rear-ended the car in front of him.

ConsumerAffairs.Com first reported the unintended acceleration problem with the Prius early last year, when one of the popular hybrids rampaged out of control on a Michigan highway, endangering the driver as well as those nearby.

At the time, the incident was the second known incident involving uncontrolled acceleration in the computer-controlled Prius. The driver of the 2005 Prius, [redacted] of Battle Creek, Michigan, experienced a probable software problem.

He found it necessary to speed up while passing a slower vehicle on the highway. The problem began after he passed the slower car and tried to slow down.

"I let off the accelerator and pressed the brakes several times, but the vehicle continued to accelerate under full power," [redacted] said at the time.

Toyota recalled the Prius hybrids to examine the software but the unintended acceleration reports are continuing.

"Twice, on July 29, 2007, our 2006 Toyota Prius took off like a rocket in circumstances just like [redacted] wild ride in Michigan last October," [redacted] in Studio City, California writes.

His Toyota service manager told [redacted] that no one has ever had this problem before and Toyota is unable to recreate the unintended acceleration.

The service technician was either uninformed of intentionally misleading his customer, since ConsumerAffairs.Com has received -- and published -- numerous such complaints.

And while the Toyota service manager may not be familiar with the problem, [redacted] in Los Lunas, New Mexico certainly is.

"I have had an incident of acceleration, beyond what was commanded, in my Toyota Prius two times. The cause is
