Fred,

I was not able to get answers to all of your questions and will pass along what we know right now:

- While the exact melt temperature of the Noryl GTX 830 was not available, we do know that this material is molded in the 540 F - 590 F range.
- Kapton does not melt nor burn. Technically it "chars". While we have not been able to determine the exact char temperature of the Kapton, we do know that it is well above 800 F.
- Our team is working on the information on the gasket -> we need to get this from our supplier.

I have a meeting with Bryan Dague and Al Hopkins first thing in the morning and will raise these questions again with them (Al is only returning from vacation on Tuesday). My concern is that we may be reliant on our suppliers for some of the information that you are requesting. What I will try to understand from Al and Bryan is if we have the capability to run tests to determine these temperatures ourselves (if this is the best way to generate the information).

Regards,

Charlie

Subject: 99-002: PROPOSED PROTOCOL FOR DISASSEMBLY AND ANALYSIS OF SWITCH FROM 77P8 FROM LINCOLN TOWN CAR

Here's a rough pass, what do you guys think?

PROPOSED PROTOCOL FOR DISASSEMBLY AND ANALYSIS OF SWITCH FROM
77P8 FROM LINCOLN TOWN CAR

- Review Ford's Analysis data that they are bringing in.
- Examine threads and determine if it is OK to just chase the threads to get a good seal or should we remove material for analysis.
- Pressure Leak Test the device (15 minute static-hold, air-pressurized test).
- Decide if we should remove any material or try any other analysis before we start disassembling the device.
- Do a practice descap using the below procedure on a deliberately fractured part (to mimic the condition that the returned device will be in) before performing it on the real sample. Bryan, you and I could do this now.
- Procedure to remove aluminum crimp ring
- Use aluminum foil (or plastic if Ford prefers) to mask the analysis surface.
- Also create a paper/tape shield to further reduce chance of contamination during cutting of crimp ring.
- Place a piece of tape over the area to be cut.
- Cut crimp ring using jewelers saw or Dremel cutoff wheel in one of the two areas indicated on optical photo.
- Cut corners of ring at 180 degree orientation
- Unfold crimp ring
- Optically examine revealed surfaces. Take optical photographs (Digital camera with macro lens plus instant microphotography) and document observations where appropriate. Examine the following areas
 - Inside surface of crimp ring.
 - Seal area and underside of base
 - Top of cap
- Start SEM-EDX (Scanning Electron Microscope with Energy Dispersive Analysis of X-rays) analysis on the inside of the ring and on various surfaces of the plastic base.
- Reprotect the top surface and remove the cap. Bryan had originally suggested just using an end mill to remove the cap. I wouldn't, however, go all the way through with the end mill. I would leave some material behind as a shield. I would suggest then banding the cap off.
- Optically document all revealed surfaces starting with cap.
- Meanwhile, start SEM-EDX analysis on top side of cap. Particularly focus in on the edges of the ceramic pin guide and on the indented ring that lines up with interior wall of the switch cavity. Particularly look for evidence of corrosion or arcing.
- Decide if we should try to flake off any of the overlying debris to try to examine the underlying metal surface.
- Proceed to perform SEM-EDX analysis on other component surfaces revealed by removal of cap.
- Non-destructively probe inside of the grommet to determine its resilience which will give us an indication of the temperature that it saw. Another indication might be the depth of the indentations left by the grommet seal rings in the wire.
- Decide if it makes sense to further examine the mating connector or grommet seal.

Regards,

Al

Re: Client: Texas Instruments
Our Claimant: Eula Cassel / Allstate
Date of Event: May 11, 1988

Dear Mr. Baumann,

As per our conversation Friday December 11, 1988, enclosed in this letter you will have the information requested.

The vehicle is being stored for Ford Motor Company by Captain Walt Godfrey of Fire Reconstruction Consultants, Inc., in Cape Canaveral, Florida. Captain Godfrey's number is (407)968-7800, and he can give you the directions to the vehicle, and provide details regarding his inspection.

Ford Motor Company does not own this vehicle it is being stored for Ford, therefore we do not have the authority to ship any part to you. Please be advised that you may view this vehicle through the expressed permission of Captain Walt Godfrey, therefore you must contact him to set up an appointment. The vehicle is being stored so that you and your expert may have the opportunity for inspection.

You may also contact our outside expert, Ray Davis, of Ray C. Davis, Inc., to discuss his inspection findings. Mr. Davis's number is (810)658-7888.

I am also making duplicates of our experts photos and will forward them to your office once I receive the copies.

If you have any further questions please contact me at: (818)223-3355.

Sincerely,

Shawn L. Norton

Subject: Town Car Fires

Team,

As an update, I just had a fairly lengthy discussion with Fred Porter (initiated by Fred) on this issue. Fred is an engineering supervisor at Ford and has been tasked with determining the root cause of the fires on the Town Cars and determining whether or not the situation warrants a recall on the part of Ford. As additional reference information, while not having familiarity with the 77PS per se, Fred does have a significant level of history with TI mainly around sensors for brake controls and has visited TI on a number of occasions. Overall, Fred has a positive view of TI.

As additional reference information, Fred's group has requested and Rob Sharpe has already set-up to visit on Tuesday next week to provide an overview on basic switch function. Initially, Rob's plan was for Rob only to go in front of Ford and pick up in Attleboro via conference call or teleconference to outline switch function. We are overnighting Rob the following materials in preparation for this visit:

- Cross section drawing
- physical sample
- mounted cross section (hopefully)

Based on my discussion with Fred today, I believe there is benefit to our having engineering representation from Attleboro at this meeting on Tuesday. I would suggest that if possible, at a minimum, Bryan (and possibly Andy) attend this meeting. For instance, Fred expects that they will have x-rays of a switch which is showing internal anomalies available on Tuesday --> as an aside, this single switch is the basis for all of the concern being directed at the switch right now. Fred is not jumping to any conclusions though he clearly would like TI to participate in the diagnostic journey and help fend off any witch hunts. Based on numerous previous interactions with Fred, I do not doubt his sincerity and believe we can only help our cause by cooperating with most any request we receive from his group.

Fred has also requested and I have agreed to put together, a matrix showing platform usage of this switch from SOP in MY92 through current usage. A couple of pieces of usage information which help defend the switch are as follows:

- Switch was also used on Crown Vic and Grand Marquis in MY92 - 93 timeframe
- Fires are isolated to MY92-93 Town Car and this platform used switch through MY97.

While Fred is not jumping to any conclusion and he has overall responsibility for determining root cause of the fires, he was very clear in letting me know that there are people at Ford who are ready to jump to conclusions based on the anomalies being seen on the one switch. This is the main reason that I believe it is important for us to cooperate with Fred as much as is reasonably possible. During our discussion, I also shared with Fred some of the history on a similar situation with our power steering pressure switch and how the switch was originally thought to be the root cause of a fire but in actuality we were able to show that the switch internal seal melted as a result of being exposed to a fire.

I think that pretty much covers the discussion today.

Any questions / issues, please let me know.

Regards,

REDACTED

From: Douglas, Charles
Sent: Friday, December 18, 1998 10:36 AM
To: 'Porter, Fred (Ford)'
Cc: Sharpe, Robert
Subject: Usage Matrix - Speed Control Deactivation Pressure Switch

Fred,

The following represents a rough usage matrix over time:

MY82	MY83	MY84	MY85	MY86	MY87	MY88
Econoline	Econoline	Econoline	Econoline	Econoline	Econoline	Econoline
Club Wagon	Club Wagon					
Town Car						
Crown Vic						
Grand Marquis						
	F Series	F Series				
	Bronco	Bronco	Bronco	Bronco		
	SHO Taurus	SHO Taurus	SHO Taurus??			
		Capri	Capri	Capri??		
		Win88	Win88	Win88	Win88	Win88
			Falcon	Falcon	Falcon	Falcon
				Explorer??	Explorer	Explorer
				Ranger??	Ranger	Ranger
					Expedition	Expedition

To be quite honest, I think we actually have more of a grasp on the application matrix in the MY92 - MY96 timeframes than MY96 on. Where you see ??, this means the actual starting or ending model year for a program may be +/- 1 model year. Also, it is conceivable that as of the MY96 timeframes, we are actually released on more platforms than what is shown above. I say this because our actual shipped volumes which are in the 2MU range, would indicate either 100% penetration for cruise control on all of the platforms listed or we are on more than the listed platforms.

One additional note, during our discussion yesterday, you talked about the switch being hot on the Town Car. I think I misunderstood the context of your statement. At the time of our discussion, I was thinking thermal hot but upon further reflection believe you may have meant wired hot. If this is the case, I am pretty sure the switch is wired hot in virtually all of the above applications. This issue can be discussed further on Tuesday as we will be prepared to provide a brief overview on our understanding of how the switch is electrically plumbed into the system.

Any additional questions, please let me know me at your convenience. Also, if the above application matrix does not come across legible, please let me know and I will have this faxed to your attention.

Regards,

Charlie

Deactivator Switch

Removal and Installation

1. Disconnect deactivator switch connector. Deactivator switch is located inside front frame rail by left front door, floorplate, and top of frame rail under brake master cylinder, F-Series and Brown.
2. Uncover switch and remove.

For installation, follow removal procedure in reverse order. Tighten switch to 18-20 Nm (13-14 ft-lb) and bleed brake lines as described in section 03-09.

Deactivator Switch

Deactivator Switch

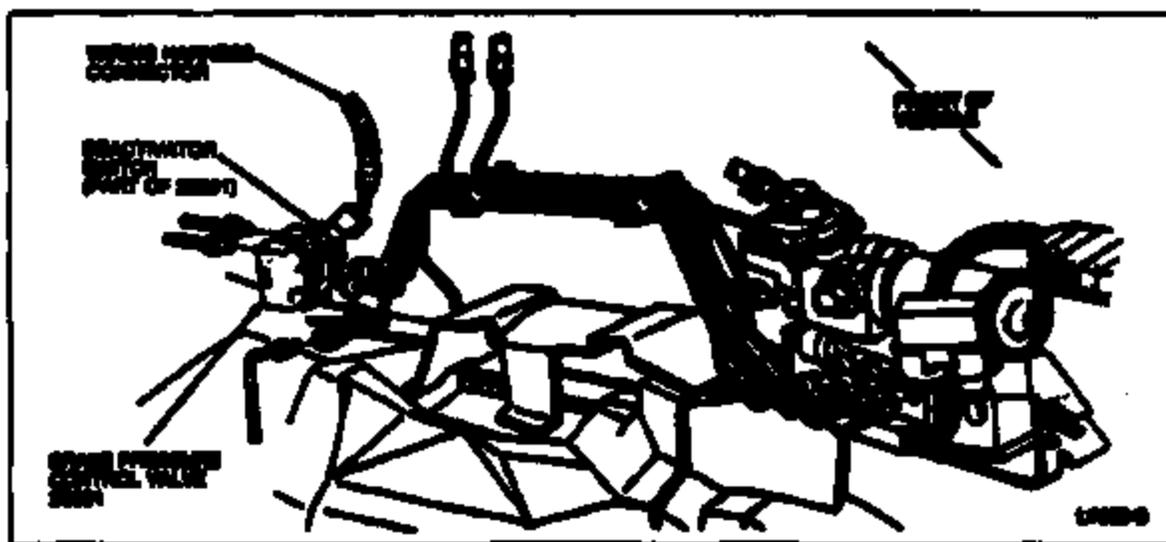

Removal

1. Remove electrical connector from deactivator switch.
2. Unscrew deactivator switch and remove from brake pressure control valve (ZB001) (vehicles with anti-lock brakes) or brake pressure switch adapter (BC300) (vehicles with conventional hydraulic brakes).

Installation

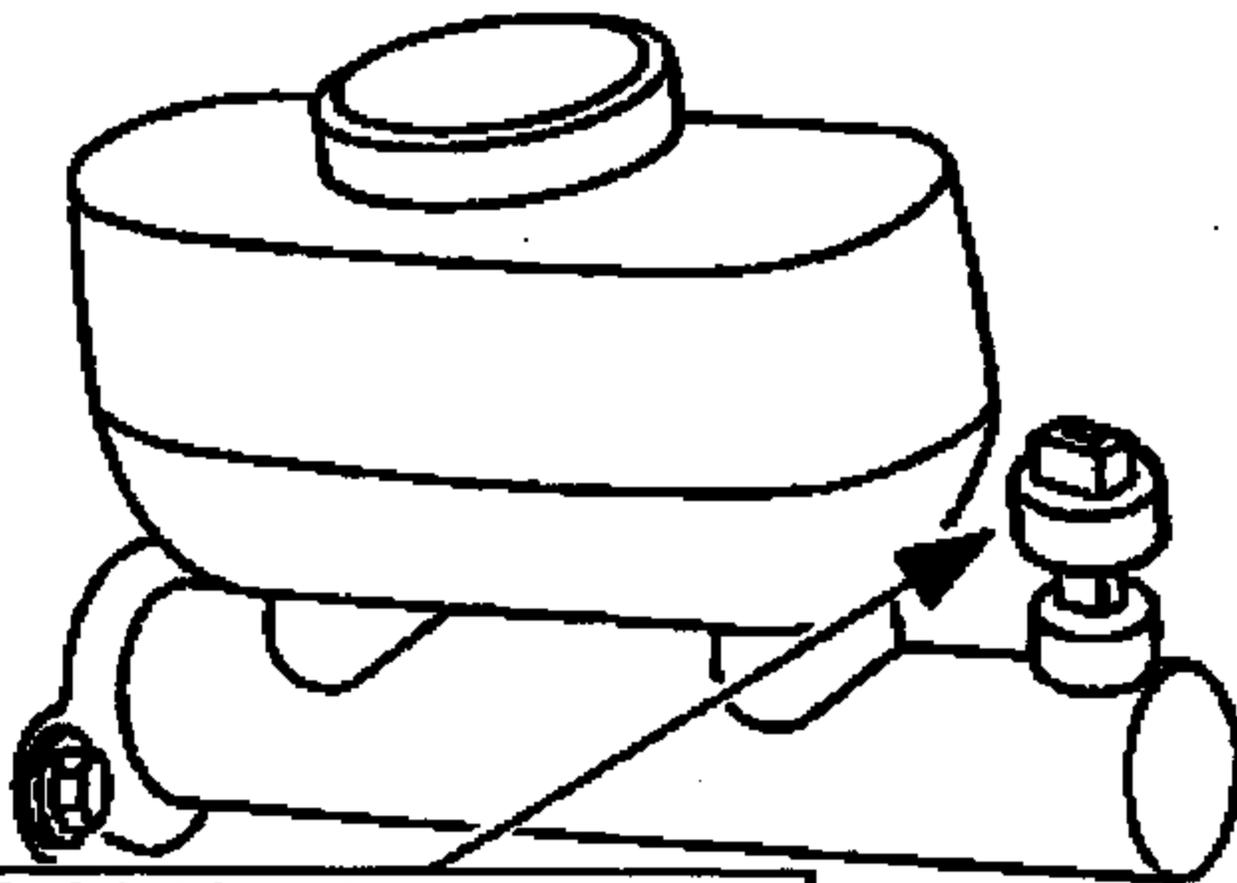

1. Screw deactivator switch into brake pressure control valve or brake pressure switch adapter. Tighten to 16-20 N-m (11-15 ft-lb).
2. Attach electrical connector.
3. Bleed brake lines as outlined in Section 9B-02 (anti-lock brakes), or Section 9B-03 (conventional hydraulic brakes).

Deactivator Switch

The deactivator switch is provided as an additional redundant safety feature in the system. Normally, when the brake pedal (2488) is depressed, an electrical signal from the brakelamp circuit to the speed control amplifier (9D843) will turn off the system. Under increased brake pedal efforts (22-45 N-m [17-33 lb-ft]), the deactivator switch mounted on the master cylinder will open and remove power to the speed control actuator clutch, releasing the throttle independent of the speed control amplifier. The deactivator switch is located underneath the brake master cylinder on the motorhome chassis.

c-douglas2@ll.com

Fred,

I believe that your list includes some service part numbers, older rev levels, as well as pre-production or prototype part numbers. Overall, including Ford Australia, there are eight different production parts. Differences from part to part are fairly minor and include, actuation calibration, release pressure, bumper style, position and / color of connector base, thread style, and snap noise associated with the pressure disc. The following matrix, helps summarize this information:

Part Number	Actuation	Release Item	Hardware	Thread	Sec. 0
P2VC 9F924 AB 90-160 (1)	20 min	Brown / pos 2	FS12	3/8-24M	Snap
PGLC 9F924 AA 200-300 (2)	40 min	Black / pos 1	FS12	3/8-24M	Snap

To be quite honest, I think we actually have more of a grasp on the application matrix in the MY92 - MY95 timeframe than MY98 on. Where you see ??, this means the actual starting or ending model year for a program may be +/- 1 model year. Also, it is conceivable that as of the MY98 timeframe, we are actually released on more platforms than what is shown above. I say this because our actual shipped volumes which are in the 2MU range, would indicate either 100% penetration for cruise control on all of the platforms listed or we are on more than the listed platforms.

One additional note, during our discussion yesterday, you talked about the switch being not on the Town Car. I think I misunderstood the context of your statement. At the time of our discussion, I was thinking thermal hci but upon further reflection believe you may have meant wired hot. If this is the case, I am pretty sure the switch is wired hot in virtually all of the above applications. This issue can be discussed further on Tuesday as we will be prepared to provide a brief overview on our understanding of how the switch is electrically plumbed into the system.

Any additional questions, please let me know me at your convenience. Also, if the above application matrix does not come across legible, please let me know and I will have this faxed to your attention.

Fred.

I believe that your list includes some service part numbers, older rev levels, as well as pre-production or prototype part numbers. Overall, including Ford Australia, there are eight different production parts. Differences from part to part are fairly minor and include, actuation calibration, release pressure, backport style, position tab / color of connector base, thread style, and snap noise associated with the pressure disc. The following matrix, helps summarize this information:

<u>Part Number</u>	<u>Actuation</u>	<u>Release</u>	<u>Base</u>	<u>Hardware</u>	<u>Thread</u>	<u>S or Q</u>

Cc: Baumann, Russ; Sharpe, Robert
Subject: Town Car Fire

Team,

As an update, I just had a fairly lengthy discussion with Fred Porter (initiated by Fred) on this issue. Fred is an engineering supervisor at Ford and has been tasked with determining the root cause of the fire on the Town Cars and determining whether or not the situation warrants a recall on the part of Ford. As additional reference information, while not having familiarity with the 77PS per se, Fred does have a significant level of history with TI mainly around sensors for brake controls and has visited TI on a number of occasions. Overall, Fred has a positive view of TI.

As additional reference information, Fred's group has requested and Rob Sharpe has already set-up to visit on Tuesday next week to provide an overview on basic switch function. Initially, Rob's plan was for Rob only to go in front of Ford and pipe in Attleboro via conference call or teleconference to outline switch function. We are overnighting Rob the following materials in preparation for this visit:

- Cross section drawing
- physical sample
- .mounted cross section (hopefully)

Based on my discussion with Fred today, I believe there is benefit to our having engineering representation from Attleboro at this meeting on Tuesday. I would suggest that if possible, at a minimum, Bryan (and possibly Andy) attend this meeting. For instance, Fred expects that they will have x-rays of a switch which is showing internal anomalies available on Tuesday -> as an aside, this single switch is the basis for all of the concern being directed at the switch right now. Fred is not jumping to any conclusions though he clearly would like TI to participate in the diagnostic journey and help fend off any witch hunts. Based on numerous previous interactions with Fred, I do not doubt his sincerity and believe we can only help our cause by cooperating with most any request we receive from his group.

Fred has also requested and I have agreed to put together, a matrix showing platform usage of this switch from SOP in MY82 through current usage. A couple of pieces of usage information which help defend the switch are as follows:

- Switch was also used on Crown Vic and Grand Marquis in MY82 - 83 timeframe
- Fire are isolated to MY82-83 Town Car and this platform used switch through MY87.

While Fred is not jumping to any conclusion and he has overall responsibility for determining root cause of the fire, he was very clear in letting me know that there are people at Ford who are ready to jump to conclusions based on the anomalies being seen on the one switch. This is the main reason that I believe it is important for us to cooperate with Fred as much as is reasonably possible. During our discussion, I also shared with Fred some of the history on a similar situation with our power steering pressure switch and how the switch was originally thought to be the root cause of a fire but in actuality we were able to show that the switch internal seal melted as a result of being exposed to a fire.

I think that pretty much covers the discussion today.

Any questions / issues, please let me know.

Regards,

Subject: Usage Matrix - Speed Control Deactivation Pressure Switch

Fred,

The following represents a rough usage matrix over time:

MY92	MY93	MY94	MY95	MY96	MY97	MY98
Econoline	Econoline	Econoline	Econoline	Econoline	Econoline	Econoline
Club Wagon	Club Wagon					
Town Car						
Crown Vic						
Grand Marquis						
	F Series	F Series				
	Bronco	Bronco	Bronco	Bronco		
	SHO Taurus	SHO Taurus	SHO Taurus??			
		Capri	Capri	Capri??		
		Win88	Win88	Win88	Win88	Win88
			Falcon	Falcon	Falcon	Falcon
				Explorer??	Explorer	Explorer
				Ranger??	Ranger	Ranger
					Expedition	Expedition
						Navigator

To be quite honest, I think we actually have more of a grasp on the application matrix in the MY92 - MY95 timeframe than MY98 on. Where you see ??, this means the actual starting or ending model year for a program may be +/- 1 model year. Also, it is conceivable that as of the MY98 timeframe, we are actually released on more platforms than what is shown above. I say this because our actual shipped volumes which are in the 2MU range, would indicate either 100% penetration for cruise control on all of the platforms listed or we are on more than the listed platforms.

One additional note, during our discussion yesterday, you talked about the switch being hot on the Town Car. I think I misunderstood the context of your statement. At the time of our discussion, I was thinking thermal hot but upon further reflection believe you may have meant wired hot. If this is the case, I am pretty sure the switch is wired hot in virtually all of the above applications. This issue can be discussed further on Tuesday as we will be prepared to provide a brief overview on our understanding of how the switch is electrically plumbed into the system.

Any additional questions, please let me know me at your convenience. Also, if the above application matrix does not come across legible, please let me know and I will have this faxed to your attention.

Regards,

Charlie

Fred,

I believe that your list includes some service part numbers, older rev levels, as well as pre-production or prototype part numbers. Overall, including Ford Australia, there are eight different production parts. Differences from part to part are fairly minor and include: actuation calibration, release pressure, hexport style, position tab / color of connector base, thread style, and snap noise associated with the pressure disc. The following matrix, helps summarize this information:

<u>Part Number</u>	<u>Actuation</u>	<u>Release Rate</u>	<u>Hexport</u>	<u>Thread</u>	<u>S or Q</u>
F2VC 9F924 AB 90-160 (1)	20 min	Brown / pos 2	IS12	3/8-24M	Snap
F6LC 9F924 AA 200-300 (2)	40 min	Black / pos 1	IS12	3/8-24M	Snap
F2AC 9F924 AA 90-200 (3)	20 min	Natural / pos 2	IS12	3/8-24M	Quiet
F5BA 9F924 AA 90-160 (4)	20 min	Grey / pos 1	IS12	3/8-24M	Quiet
F3TA 9F924 CA 200-300 (5)	40 min	Red / pos 1	IS12	3/8-24M	Snap
94DA 9F924 AA 90-160 (6)	20 min	Natural / pos 2	o-ring	M10x1.0M	Quiet
F3DC 9F924 AA 90-160 (7)	20 min	Natural / pos 2	Snubber	3/8-24M	Quiet
94JA 9F924 AB 90-160 (8)	20 min	Grey / pos 1	o-ring	3/8-24M	Quiet

Subject: Town Car Fires

Team,

As an update, I just had a fairly lengthy discussion with Fred Porter (initiated by Fred) on this issue. Fred is an engineering supervisor at Ford and has been tasked with determining the root cause of the fires on the Town Cars and determining whether or not the situation warrants a recall on the part of Ford. As additional reference information, while not having familiarity with the 77PS per se, Fred does have a significant level of history with TI mainly around sensors for brake controls and has visited TI on a number of occasions. Overall, Fred has a positive view of TI.

As additional reference information, Fred's group has requested and Rob Sharpe has already set-up to visit on Tuesday next week to provide an overview on basic switch function. Initially, Rob's plan was for Rob only to go in front of Ford and pipe in Attleboro via conference call or teleconference to outline switch function. We are overnighting Rob the following materials in preparation for this visit:

- Cross section drawing
- physical sample
- mounted cross section (hopefully)

Based on my discussion with Fred today, I believe there is benefit to our having engineering representation from Attleboro at this meeting on Tuesday. I would suggest that if possible, at a minimum, Bryan (and possibly Andy) attend this meeting. For instance, Fred expects that they will have x-rays of a switch which is showing internal anomalies available on Tuesday --> as an aside, this single switch is the basis for all of the concern being directed at the switch right now. Fred is not jumping to any conclusions though he clearly would like TI to participate in the diagnostic journey and help fend off any witch hunts. Based on numerous previous interactions with Fred, I do not doubt his sincerity and believe we can only help our cause by cooperating with most any request we receive from his group.

Fred has also requested and I have agreed to put together, a matrix showing platform usage of this switch from SOP in MY92 through current usage. A couple of pieces of usage information which help defend the switch are as follows:

- Switch was also used on Crown Vic and Grand Marquis in MY92 - 93 timeframe
- Fires are isolated to MY92-93 Town Car and this platform used switch through MY97.

While Fred is not jumping to any conclusion and he has overall responsibility for determining root cause of the fires, he was very clear in letting me know that there are people at Ford who are ready to jump to conclusions based on the anomalies being seen on the one switch. This is the main reason that I believe it is important for us to cooperate with Fred as much as is reasonably possible. During our discussion, I also shared with Fred some of the history on a similar situation with our power steering pressure switch and how the switch was originally thought to be the root cause of a fire but in actuality we were able to show that the switch internal seal melted as a result of being exposed to a fire.

I think that pretty much covers the discussion today.

Any questions / issues, please let me know.

TI-NHTSA 016132

Regards.

Charlie

Charlie,

Fred Porter just left a message asking for the following information for tomorrow's meeting (@ 10am)

- Copies of the FMEA (He did not specify Process or Design, I would recommend having both)
- Results of latest In-Process Testing
- Cross Sectional Sample (I believe you have already sent)

Please confirm who from Attleboro will be attending. I can pick up/drop off at the airport.

Best Regards,

Rob Sharpe

- rays) analysis on the inside of the ring and on various surfaces of the plastic base.
- Reprotect the top surface and remove the cap. Bryan had originally suggested just using an end mill to remove the cap. I wouldn't, however, go all the way through with the end mill. I would leave some material behind as a shield. I would suggest then bending the cap off.
 - Optionally document all revealed surfaces starting with cap.
 - Meanwhile, start SEM-EDX analysis on top side of cap. Particularly focus in on the edges of the ceramic pin guide and on the indented ring that lines up with interior wall of the switch cavity. Particularly look for evidence of corrosion or arcing.
 - Decide if we should try to flake off any of the overlying debris to try to examine the underlying metal surface.
 - Proceed to perform SEM-EDX analysis on other component surfaces revealed by removal of cap.
 - Non-destructively probe inside of the grommet to determine its resilience which will give us an indication of the temperature that it saw. Another indication might be the depth of the indentations left by the grommet seal rings in the wire.
 - Decide if it makes sense to further examine the mating connector or grommet seal.

Subject: RE: Town Car Fires

Charlie,

Fred Porter just left a message asking for the following information for tomorrow's meeting (@ 10am)

- Copies of the FMEA (He did not specify Process or Design, I would recommend having both)
- Results of latest In-Process Testing
- Cross Sectional Sample (I believe you have already sent)

Please confirm who from Attleboro will be attending. I can pick up/drop off at the airport.

Best Regards,

Rob Sharpe

Subject: Town Car Fire

Team,

As an update, I just had a fairly lengthy discussion with Fred Porter (initiated by Fred) on this issue. Fred is an engineering supervisor at Ford and has been tasked with determining the root cause of the fires on the Town Cars and determining whether or not the situation warrants a recall on the part of Ford. As additional reference information, while not having familiarity with the 77PB per se, Fred does have a significant level of history with TI mainly around sensors for brake controls and has visited TI on a number of occasions. Overall, Fred has a positive view of TI.

As additional reference information, Fred's group has requested and Rob Sharpe has already set-up to visit on Tuesday next week to provide an overview on basic switch function. Initially, Rob's plan was for Rob only to go in front of Ford and pipe in Attleboro via conference call or teleconference to outline switch function. We are overnighting Rob the following materials in preparation for this visit:

- Cross section drawing
- physical sample
- mounted cross section (hopefully)

Based on my discussion with Fred today, I believe there is benefit to our having engineering representation from Attleboro at this meeting on Tuesday. I would suggest that if possible, at a minimum, Bryan (and possibly Andy) attend this meeting. For instance, Fred expects that they will have x-rays of a switch which is showing internal anomalies available on Tuesday -> as an aside, this single switch is the basis for all of the concern being directed at the switch right now. Fred is not jumping to any conclusions though he clearly would like TI to participate in the diagnostic journey and help fend off any witch hunts. Based on numerous previous interactions with Fred, I do not doubt his sincerity and believe we can only help our cause by cooperating with most any request we receive from his group.

Fred has also requested and I have agreed to put together, a matrix showing platform usage of this switch from SOP in MY92 through current usage. A couple of pieces of usage information which help defend the switch are as follows:

- Switch was also used on Crown Vic and Grand Marquis in MY92 - 93 timeframe
- Fires are isolated to MY92-93 Town Car and this platform used switch through MY97.

While Fred is not jumping to any conclusion and he has overall responsibility for determining root cause of the fires, he was very clear in letting me know that there are people at Ford who are ready to jump to conclusions based on the anomalies being seen on the one switch. This is the main reason that I believe it is important for us to cooperate with Fred as much as is reasonably possible. During our discussion, I also shared with Fred some of the history on a similar situation with our power steering pressure switch and how the switch was originally thought to be the root cause of a fire but in actuality we were able to show that the switch internal seal melted as a result of being exposed to a fire.

I think that pretty much covers the discussion today.

Any questions / issues, please let me know.

Regards,

Charlie

It's no problem if the Ford Engineers remove some of the green material. I would prefer it, however, if the Ford Engineers didn't damage the material right around the ceramic pin guide (noted on photo) since we want to determine if there was any corrosion of this area or if there were any signs of arcing. Also if there were other corrosion products on this area that might have crept up the edges of the ceramic pin even though this doesn't seem particularly probable because of the constant motion of the pin.

Just to remind you, I had a couple of other questions.

Does the utilized foam type extinguisher contain water and could it contribute to corrosion? or can we rule that out?

Did it rain in that area within the last day or so of the fire?

Notes

Ford is currently investigating several thermal incidents involving MY92/93 Lincoln Town Cars. As such, Ford requested a meeting with TI to review the design/functionality of our brake pressure switch (pn F2VC-9F924-AB / 77PSL2-1). The following items summarize these discussions:

- Bryan Dague presented a design overview of the 77PSL2-1. Cross section illustrations and physical samples (including "take a-parts") were given to Ford. Several issues were discussed in general, regarding connector seal integrity, venting, switch component materials, corrosion (including detection), and current loads.
- Ford submitted a circuit diagram which confirmed the switch is fused at 15 amps and is powered by V bat. Bryan Dague offered to complete component testing at the max current level.

- Ford submitted photographs and X-Rays of a switch taken from a MY93 Lincoln in Memphis, Tennessee (vehicle built 9/10/92, switch date code = "2056"). These photographs will be reviewed by TI TSL week of 11/28/09. The actual switch was shown but remained with Ford for additional testing at their Central Lab.
- Ford expressed interested in allowing TI to analyze the above switch at TI TSL. Ford requested a protocol for review and has scheduled 1/7/98 visit to TI to participate in the testing/analysis.
- Ford presented x-ray pictures and photos that suggest corrosion as a possible factor in the fire. Many of their questions related to contamination ingress and corrosion of the internals of the switch.

Action Items

- Confirm material specifications for all switch components. Assembly/Cross Section drawing with material spec. # for each component is satisfactory. (Dague, 1/5/99)
- Submit switch analysis protocol at TI TSL to Ford for their review. (Dague/Hopkins, 1/4/99)
- Confirm Ford visit/agenda to TI- Attleboro TSL on 1/7/98. (Douglas/Sharpe, 1/4/99)
- Define component test procedure and schedule for max current loads, based on 15 amp circuit protection. (Dague, 1/5/99)
