IN THE COUNTY COURT

AT LAW NUMBER 2

TRAVIS COUNTY, TEXAS

FILED
96 DEC -5 PM 4:44
DANCY BEAUDOIN
COUNTY CLERK
TRAVIS COUNTY, TEXAS

ORIGINAL PETITION

TO THE HONORABLE JUDGE OF SAID COURT:

COME NOW [redacted] and [redacted] ("Plaintiffs") and file this Original Petition against Ford Motor Company ("Defendant") and for cause would show the following:

I.
PARTIES

Plaintiffs are individuals residing in the State of Texas.

Defendant is a company duly licensed and doing business in the State of Texas. It may be served through its registered agent for service of process, CT Corporation Systems, 350 North St. Paul Street, Dallas, TX 75201.

II.
BACKGROUND FACTS

On June 10, 1996, Plaintiffs' 1992 Ford Crown Victoria caught fire due to a defect or malfunction causing an overheating condition within the wiring or connections in the electrical distribution box. As a result of this, Plaintiffs sustained $11,026.63 in damages.

III.

DEFECTIVE PRODUCT

At the time of this occurrence, Defendant was engaged in the business of designing, manufacturing and marketing automobiles, including the one made the basis of this claim, for

sale to and for use by members of the general public. Plaintiff would show that the automobile in question (V.I.N. 2FACP73W6NX155863) was defective and unsafe for its intended purposes at the time it left the control of Defendant, in that it was defectively designed and/or manufactured in a manner which made the product unreasonably and inherently dangerous. Plaintiff would further show that the automobile in question was defectively marketed by Defendant in that Defendant failed to adequately warn or instruct consumers, including Plaintiff, of the dangers associated with the product.

IV.
STRICT PRODUCT LIABILITY

Plaintiff invokes the doctrine of strict liability, Section 402A, RESTATEMENT (SECOND) OF TORTS, as adopted by the Supreme Court of Texas. Plaintiff alleges that Defendant is strictly liable for designing, manufacturing and marketing the automobile into the stream of commerce when the product was unreasonably dangerous. The defective design, manufacture and/or marketing of the automobile was the proximate cause of the occurrence and of Plaintiff's damages.

Plaintiff would further show that Defendant is strictly liable to Plaintiff under 402B of the RESTATEMENT (SECOND) OF TORTS for misrepresenting that the product was safe and without defect. These representations were false and involved a material fact concerning the character or quality of the automobile. Plaintiff would show that he relied on these representations and that Defendant's misrepresentations were the proximate cause of the occurrence and of Plaintiff's damages.

V.
NEGLIGENCE

Plaintiff alleges that Defendant was negligent in the design, manufacture and/or

marketing of the automobile, in that Defendant knew, or in the exercise of ordinary care, should have known, that the automobile was defective and unreasonably dangerous to ultimate consumers. Plaintiff would show that Defendant's negligent acts and/or omissions were the proximate cause of the occurrence and of Plaintiff's damages.

VI.
RES IPSA LOQUITUR

In that alternative, Plaintiff would further show that he cannot more specifically allege the specific acts of negligent design and manufacture on the part of Defendant, for the reason that the facts in that regard are peculiarly within the knowledge of Defendant, and in the event Plaintiff is unable to prove specific acts of negligent design and manufacture, Plaintiff relies on the doctrine of *res ipsa loquitur*. In this connection, Plaintiff will show that the design and manufacture of the automobile were within the exclusive control of Defendant. Plaintiff had no means of ascertaining the method or manner in which the automobile was designed or manufactured by Defendant. Plaintiff would show that the product came into his possession in the same condition it was in when it left the control of Defendant. The occurrence causing harm to Plaintiff was one which, in the ordinary course of events, would not have occurred without negligence on the part of Defendant. Plaintiff would show that Defendant' negligent acts and/or omissions were the proximate cause of Plaintiff's damages.

VII.
BREACH OF WARRANTY

Plaintiff further alleges that Defendant expressly and impliedly warranted to the public that the automobile was of merchantable quality and was safe and fit for the purposes intended when used under ordinary conditions and in an ordinary manner. Plaintiff would show that Defendant' breach of these warranties were the proximate cause of the occurrence

and of Plaintiff's damages. TEX. BUS. & COM. CODE Sec. 2.314 - 2.315, Sec. 17.50 (a)(2), (Vernon 1989). Plaintiff would further show that Defendant is liable for all attorney fee's pursuant to §38.001 of the Texas Civil Practice & Remedies Code.

VII.
DECEPTIVE TRADE PRACTICES ACT

Plaintiff would show that Defendant is also liable for violations of the Texas Deceptive Trade Practices and Consumer Protection Act ("DTPA"), including:

A. Representations that the product in question, and its component parts, possessed qualities, characteristics, uses and benefits which they did not possess - [TEX. BUS & COM. CODE §17.46(5), (Vernon 1990)];

B. Representations that the product in question, and its component parts, were merchantable when, in fact, they were not fit for the ordinary purposes for which such products were to be used - [TEX. BUS & COM. CODE §17.46(19), (Vernon 1990)];

C. Failing to disclose information concerning dangers of the automobile known to Defendant, when such failure was intended to induce the consumer to purchase the product - [TEX. BUS & COM. CODE §17.46(22), (Vernon 1990)];

The above acts and/or omissions of Defendant were a proximate cause of the occurrence and of Plaintiff's $11,026.63 damage to his real and personal property.

Pursuant to the common law of Texas and to the various statutes referenced herein, Defendant is liable to Plaintiff for actual and treble damages, interest, court costs, and reasonable attorney fees.

WHEREFORE, PREMISES CONSIDERED, Plaintiff requests that Defendant be cited to appear and answer, and that on final trial, Plaintiff have:

1. Judgment against the defendant for a sum in excess of the minimum jurisdictional limits of the Court;

2. Pre-judgment interest and post-judgment interest as provided by law;

3. Costs of suit;

4. Attorney fees;

5. Such other and further relief to which the she may be justly entitled.

Respectfully submitted,

ASSIGNMENT

This assignment was received July 15, 1996 at 1:16 p.m. via FAX from Property Claim Trainer Michael Huck with instructions to conduct a vehicle fire cause examination. Investigation commenced 8/14/96.

ENCLOSURES

1. 29 vehicle photographs

INSURED PROPERTY

The risk is a dark blue, 1992 Ford Crown Victoria, four door sedan bearing Texas license plate PCW-68Z. The vehicle identification number is 2FACP73W6NX155863. The car is powered by a large displacement, fuel injected, V-8 motor and automatic transmission. It is equipped with power steering, power brakes, electric door locks and windows, dash mounted radio, cruise control and all season heating and air conditioning. All four tires and simulated wire wheel hubcaps were still on the vehicle. The body was straight and I saw no evidence of prior collision damage. According to the odometer, there were 58,865 miles on the car.

VEHICLE EXAMINATION

NOTE: *All references to sides and corners are made as if you were sitting in the driver's seat.*

A vehicle fire cause examination was conducted on Wednesday, 8/14/96 commencing at 12:45 p.m. at the Insurance Auto Auctions storage and sale facility, 4701 Agnes Street, Corpus Christi, Texas. The risk was photographed and diagrammed at that time. There were no adverse conditions or appreciable alterations to the car; therefore, a true and accurate fire cause determination was possible. I was the only person present during this portion of the investigation.

From an exterior examination it was almost impossible to tell a fire had occurred. None of the exterior paint was burned or blistered and all window glass was still intact. Once the hood was raised, a minor amount of paint damage and heat stress was present on the underside, near the right front corner (photo #7).

Even with the hood open it was difficult to tell a fire had occurred until some significant burning to the right front inner fender well was noted (photo #8). This corresponds with the damaged paint and heat stress to the underside of the hood. Virtually all combustibles, including hoses, belts, plastic parts and wiring insulation, were still intact. This was especially true on the left side of the engine compartment where no burning was noted to any of the various components (photo # 9).

The left side was the area where the rubber fuel lines and quick-connectors were routed. They were attached to the fuel rail on the left side of the motor and had obviously not received any fire damage (photo #10). It has been my experience that fires caused by an electrical defect or malfunction are much more centralized then those involving flammable or combustible liquids. Even the fire damage on the right side of the V-8 motor was minimal (photo #11).

All of the burning was clearly localized to the extreme, right front corner of the engine compartment (photo #12). The twelve volt battery had been removed prior to my examination but I did not see any localized burning to the battery tray or nearby sheet metal (photo #13). The most intense burning was clearly localized around the forward end of an electrical block and fuse panel. I did see that one of the bare wires had became unattached from a fitting or connection (photo #14).

The wires were closely examined; however, I did not see any evidence of arcing or shorting on the bare copper conductors. The separated end is the only evidence of

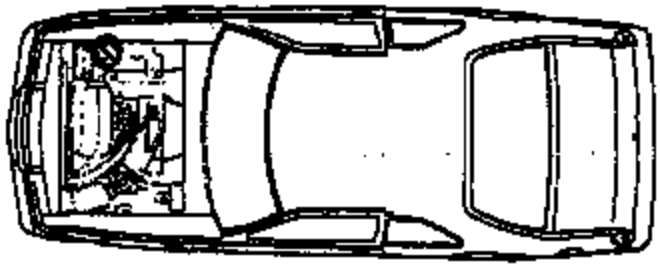
separation possibly due to an arc or short circuit. A check of a repair manual indicated the correct name for the electrical block/fuse panel was the "electrical distribution box". It had apparently been bolted to the inner fender well as the mounting studs and nuts were still attached (photo #15).

When the electrical distribution box was picked up and more closely examined, I saw an eyelet, solderless terminal, attached to a large electrical lug, was the area where the separated wire had been connected (photo #16). The interior of the electrical distribution box also exhibited fairly heavy fire damage (photo #18).

Once the fuse box cover was removed, it was evident the only fire damage was to two of the large fuses on the rear of the panel (photo #19). The bottom cover was removed from the electrical distribution box at which time I noted an interior cover was burned approximately half way off (photo #20). The burning to the underside of the component was clearly localized with fire damage to three of the wires (photo #21).

A check of the fuse panel revealed two of the blade type fuses had blown. In this instance, the short circuit was sufficient to "weld or bond" one of the fuse legs to the mounting slot. These fuses were removed which confirmed the heavy damage to each one (photos #23 & 24).

After more of the plastic case, on the power distribution block, was removed, burning was noted to the base of the fuse receptacles. This is clearly internal, localized heating coming from a wire or connection on the power distribution box. In this instance, I feel an arc or spark occurred between the wire attached to the electrical lug with the eyelet, solderless, terminal (photo #29). The following conceptual diagram shows the engine compartment of the risk, the location of the power distribution box and the specific area *where* the fire originated.



DETERMINATION OF FIRES CAUSE

Based on physical evidence remaining on the vehicle and information obtained from various sources, it is my opinion this was an accidental fire. It occurred from an unspecified defect or malfunction which caused an overheating condition within the wiring or connections in the electrical distribution box.

COMMENTS

With the completion of my investigation, I feel the cause of this fire has been well documented. The minor amount of burning is clearly centered around the power distribution box and the area where the wire came off the solderless terminal could have caused resistance heating or a short circuit. Although this car was approximately four years old, it appeared to be in very good shape and I saw no evidence of abuse, neglect, alterations or non-OEM parts. If the electrical system, specifically the power distribution box, has not been worked on then whatever caused this fire was built into the car at the assembly plant.

Although no additional investigation is anticipated, I am leaving this file open for 30 days to allow you sufficient time for review and evaluation. If either yourself or Mr. Huck have any further instructions, questions or information, please feel free to call at anytime. As always, I can be contacted through my Irving, Texas office or my digital pager.

Respectfully Submitted,

TECHNICAL BULLETIN

Ford IAR Alternators with Battery Plug Connection

COPY

WARNING! WARNING! WARNING!

To reduce the risk of premature alternator failure and/or wiring harness fire, these precautions must be followed.

1. PROFESSIONAL INSTALLATION REQUIRED

This internally-regulated Ford alternator requires professional installation utilizing proper equipment. You should not attempt this installation unless you are properly equipped and trained.

2. CHANGE THE LARGE PLUG-IN CONNECTOR!

The heavy wire 3-prong connector carries all of the output current produced by the alternator. This plug was designed for original assembly line installation without tools. It snaps tightly into place and is difficult to remove. The twisting and pulling which occurs during removal will cause the metal connectors within the plug to spread and weaken. If the plug is re-used, the poor contact made between it and the terminals in the alternator creates resistance and heat, which leads to alternator failure and/or a catastrophic wiring harness fire.

Always use a new plug connector when installing this type of alternator. An O.E.M. style connector with splicing pigtail is supplied with your Precision remanufactured alternator as of 12/01/92 production date codes.

3. INSTALLATION

These procedures must be followed to ensure a professional, high quality installation.

A. Disconnect the battery.

B. Mount the alternator to the brackets with the output plug in place.

C. Cut the vehicle harness at an appropriate spot to easily match the length of the supplied plug and pigtail.

D. Strip the insulation back 3/8" and ensure that the exposed copper wires are clean and shiny.

E. Apply a small amount of rosin-type flux directly on the wires and insert them into the tube connectors provided. - continued on reverse

FILE COPY

3. INSTALLATION (continued)

F. Crimp the connector securely with a proper tool that is designed to "crimp" the connection. You must make a strong physical connection before soldering.

G. Slide the heat shrink tubing as far away from the connector as possible to avoid premature shrinking.

H. Solder the terminal using a 60/40 rosin core solder. Be careful to heat the connector properly and allow the solder to flow into and through the connection.

I. After the soldered connection is cool, slide the heat shrink tubing in place and heat until it conforms to the connection and seals it.

NOTE: Do not skip any steps.
Do not use acid core solder or acid type flux.
Do not rely on solder alone or crimping alone to make the connection. You must do both!
Do not use wire nuts or Scotch-Loc connectors.
Call for assistance. Our Technical Services Department will be glad to help explain this installation.

FAILURE TO PROPERLY INSTALL THIS PLUG VOIDS YOUR WARRANTY.

4. CONNECT IT ONCE

As mentioned previously, removal of the large plug loosens the connection. Therefore, removal and replacement of even a new connector may lead to failure. The plug has been installed using a special contact gel recommended by Ford. Do not remove this gel!

5. LOAD TEST THE BATTERY

Faulty batteries strain the vehicle's electrical system. Load testing the batteries will detect bad batteries before they cause a comeback. This is especially important on Ford internally-regulated charging systems.

6. CHARGE OR REPLACE THE BATTERY

You must fully charge the battery with an appropriate battery charger. Alternators are not designed to recharge a "dead" or even a new battery. Using the alternator to bring a battery to a full state of charge is a poor service practice that can overheat and destroy the alternator. Continuous high alternator output required to recharge a dead battery will result in an overheated connector plug and may cause a wiring harness fire.

SOUTHLAND REBUILDERS

DIVISION OF ROSEVILLE & CO.

REMANUFACTURER'S BULLETIN

July 15, 1992

RB-T-92-102

TO: All Dealer Parts and Service Managers

FROM: Southland Rebuilders - Quality Assurance

SEP 2 1992

SUBJECT: IAR Alternator Failures

The IAR Alternators have been experiencing problems that result in failure of the rectifier due to shorting out the diodes and/or burning the wiring harness. Both failure modes are caused by excessive heat being generated within the system.

We have concluded, with the cooperation of a few dealers within our network, that the problem is caused by a damaged harness plug. In the process of removing the failed alternator, the harness plug is pried out of the rectifier and the side clips are distorted and/or broken off. These clips are critical in retaining the harness plug in the rectifier to prevent the plug from backing out. Should the plug back out an air gap will develop and arcing will occur which will cause heat.

Southland Rebuilders' recommendation is to replace the damaged and/or broken plug with a new plug, FORD part number E7FZ-10A568-A. We also suggest that the rectifier socket have a dielectric compound, FORD part number D7AZ-19A331-A, grease applied to the terminals. We recommend that a tie wrap be wrapped around the outside of the harness plug for added security. Care must be taken that the plug is fully seated in the rectifier socket.

The above recommendation has been approved by FORD Product Engineering, Rawsonville Plant, and by FORD Parts and Service Division Remanufacturing Engineering.

With the above in mind, Southland Rebuilders' position regarding the warranty of failed alternators will be:

IN ORDER TO BE COVERED BY SOUTHLAND'S WARRANTY, ANY IAR ALTERNATOR THAT HAS FAILED DUE TO A BURNED RECTIFIER THAT WAS INSTALLED AFTER AUGUST 1, 1992, WILL REQUIRE THAT THE ALLEGED DEFECTIVE ALTERNATOR AND PLUG BE RETURNED TO OUR PLANT, ALONG WITH THE USUAL WARRANTY PAPERWORK, TO SHOW THAT THE PLUG WAS REPLACED WITH E7FZ-10A568-A.

Loose Alternator Bearing Cap

• Can Cause Fire

In March of this year we investigated an interesting a car fire that occurred while the vehicle was operating at high idle RPMs in a car wash. The automobile was a 1992 Ford Mustang with a 5.0 liter high output engine with electronic fuel injection.

Our report on the investigation stated:

"The vehicle was identified as in caption with a manufacture date of August 1991 and recorded mileage of 876 miles. The passenger compartment did not suffer fire or heat damage. The fire damage was confined to the engine compartment and primarily on the right side. The vehicle is powered by a 5.0 liter V8 engine. The fuel supply and return lines were in place and the snap guards were in place over the quick connect fittings. The plastic portions of these fuel lines had burned and melted away as is common in these cases. The general fire pattern in the engine compartment would not indicate that a fuel leak took place. In examining the right side of the engine compartment it was noted that a circular metal type of 'cap' had attached itself to the alternator output wiring. Closer checking revealed this attachment was caused by a 'welding' p ocess created when the metal cap ma connect with the alternator wiring an 'short' occurred.

Continuing examination revealed the metal 'cap' was for the rear alter ter bearing. The bearing itself had apparently fallen out and was lost. It is opinion that the fire was electrica nature and was caused by the rear a nator bearing falling out and shor against the output wiring."

Ford Motor Company reimburse Insurance carrier for their pay o this loss. ■

Alternator fire- continued

Point of Origin

1. The primary burn damage to the hood indicates that the fire originated in the area above the alternator.

2. The alternator pulley/fan has a heat pattern radiating from the center indicating higher heat at the center.

3. The discoloration of the alternator pulley/fan indicates higher heat in this component than in other areas of the engine compartment.

4. The alternator bearings felt very rough when the alternator pulley was turned by hand. Some of this could be due to the fire, but other components, such as the water pump, freon compressor, power steering pump, and idler pulleys felt smooth when turned by hand.

5. Reportedly the alternator drive belt had been replaced shortly before the fire occurred.

Conclusions

1. The fire was caused by an overheated alternator, which ignited nearby flammable components.

2. The bearings likely were faulty before the belt was changed. This could have contributed to the previous belt needing replacement. Bearing failure due to faulty belt installation is not likely, as this system is equipped with automatic belt tensioners and requires no adjustment.

3. The bad alternator bearings likely could have been detected at the time of belt installation by merely spinning the pulley by hand. It is also likely that the bearings would make an abnormal noise.

Recommendations

1. If the repair was done by a service facility, subrogation should be looked into. The installer should be questioned regarding the repair. If a bearing noise was heard the alternator should have been checked to determine the problem. Arguably, the alternator and other accessories should have been spun by hand as a minimum check during belt replacement. If the previous belt was broken, or had worn out in a short time, or if there had been complaints indicating low charging, the technician that changed the belt should have checked the alternator bearings. This could have been done simply by spinning the pulley, and by feeling by hand for roughness or looseness (this would have taken only a matter of seconds to do)."

We thank Ed and Gene for sending along this information. It would be interesting to know if a trend is developing here. If any of you have any similar cases we would like to know about them. ■

Vehicle Safety & Security Report

Prepared By Lee S. Cole & Associates, Incorporated

Ford Alternator Fires

IN THIS ISSUE:

In past issues of *Vehicle Safety & Security Report* we have reported on two cases where an alternator malfunction resulted in an engine compartment fire in a Ford product. One of these was a Thunderbird and the other a Mustang. Mr. Ed Horkey of Horkey & Associates and Mr. Gene Meng of Meng Engineering have sent us information on a similar fire in a 1988 Ford Mustang. Their joint report follows:

"Inspection of the Vehicle
General condition:

1. The burn damage was limited to the front of the vehicle. The front bumper and body plastic were severely burned and melted from the center to the left front corner.

2. The paint above the left front wheel opening is burned, and the front edge of the driver's door is lightly burned.

3. There are two burn patterns on the hood, a light pattern at the rear of the hood extending into the cowl, and a heavier pattern above the area where the alternator is located.

4. The fire damage inside the engine compartment is extensive, particularly at the front of the engine. Most of the non metal materials in the front of the engine compartment have been consumed or melted.

a. The fan shroud had been consumed.
b. The flat accessory drive belts had been consumed except for a small portion that was trapped between two pulleys.
c. The battery was melted, and partially consumed.
d. The coolant overflow bottle was completely gone.
e. The windshield washer fluid bottle was gone.
f. The air cleaner and associated tubing was melted and/or missing.
g. The underhood insulation material had melted down onto the engine.
h. The fuel lines at the rear of the engine had melted and added fuel to the fire during the late stages of the fire.

continued on page 2

Eye On Electronics

Mike Dale

There are several ways to repair wiring harnesses. This month, Mike takes a look at a few different methods and examines the pros and cons of each.

In reading through a pile of service bulletins recently, I was struck by the similarity of some of the complaints. One of them involved high-amperage Ford alternators used between 1985 and 1988. These alternators, used on various Lincoln, T-Bird, Taurus and Mustang applications, were running into significant failures associated with the voltage regulator and the wire harness connector.

The gist of the problem was that high currents from the alternator were causing damage to the small terminals in the regulator. This in turn caused deterioration of the wire harness connector. Sometimes the connectors and the alternator/regulator would overheat and catch fire. The problem is so serious that many rebuilders will not guarantee Ford alternators unless a new $14 wire harness connector is replaced at the time of installation.

A similar problem is afflicting the O_2 sensor replacement business. A look through a Nieboff catalog shows almost 80 different sensors listed for the various applications they cover. Some aftermarket companies are offering universal-fit replacement sensors that require cutting and splicing the wire harness connector. Supplying one sensor to be mated to a whole bunch of OE connectors, greatly simplifies the inventories that have to be carried by local parts houses.

The common thread between the Ford alternators and the O_2 sensors is the recommendation to cut and splice the wiring harness. Without a doubt, this can be and is done every day without problem. However, if it's done badly, you can wind up installing more trouble than you fixed. The key to a good spliced connection is understanding what you're trying to accomplish and what can go wrong when you do it incorrectly. For those of you jumping ahead of me, solder may not always be the best solution.

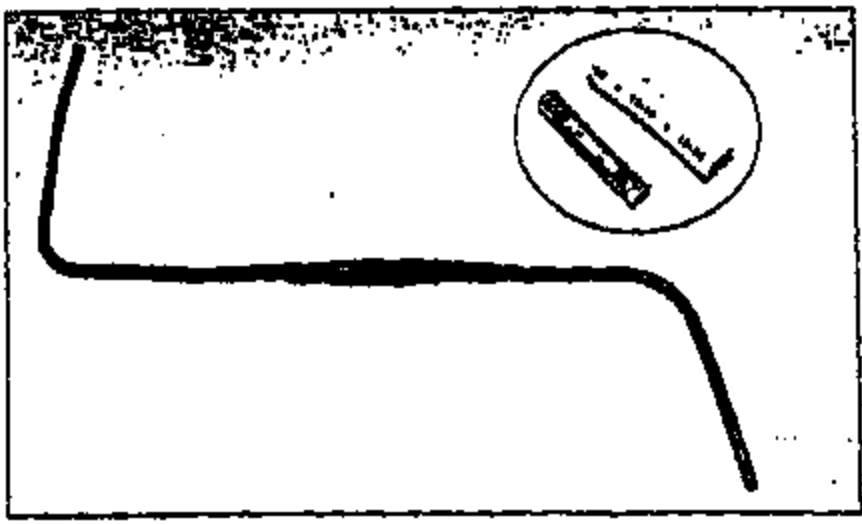
The first thing to remember is that the best connection is no connection at all. The unbroken, stranded wire sizing safely inside its PVC or crosslink polyester insulation is very efficient. Unless it sees a drastic overcurrent condition or mechanical damage, that wire will last virtually forever. The only reason you should ever splice a harness is because you have to.

In making the splice, you're trying to get the wire-to-wire junction back as close to original as possible. This includes not only the electrical connection, but mechanical features such as wire sealing, wire draping and support and wire location.

The electrical connection itself can be made by either soldering the wires or crimping them together with a mating terminal such as a butt splice. The disadvantage of using solder is that if you don't have a sound mechanical connection, you run the risk of last-minute motion between the wires occurring before the solder is totally solid. That results in a pasty, or cold, solder joint.

When soldering, the two wires to be spliced are often held parallel and then twisted together. That means that after the joint is made and the harness is

continued on page 22



Butt splice connectors (inset) are color-coded for the size of the wire and usually have a range of only two gauge sizes. After the butt splice is completed, the heat-shrink tubing must be uniformly and evenly shrunk, and should extend a minimum ¼ inch beyond each end of the connector.

repositioned, the connection sometimes winds up being perpendicular to the drops of the wires.

You can see the problem here if you think of the wires coming away from the joint as lever arms, with the stiffness of the wire transmitting forces to the junction of the wires. The right-angle joint focuses the lever action of the wires onto the angle of the joint. This is an inherently weak connection from a vibration and mechanical standpoint.

In making a good solder joint, we also run into the problem of capillary action. In the same way that a wick soaks up kerosene in a lamp, the multiple strands of copper in a wire can soak up solder, solder flux and eventually salt water and other liquid contaminants. If solder wicks back up into the wire, it can result in the wire being stiff because the strands are soldered together. Flux and salt wicking can cause hidden corrosion, as well.

There are two alternatives to the right-angle, twisted solder joint. One is to slightly splay or fray the two ends, stick them into each other, then crimp and solder them. This doesn't have as firm a mechanical locking as the twisted joint. However, it's better in that it has the joint properly aligned to the eventual lay of the finished wire. The other problems remain, but at least it solves the right-angle leverage problem.

The second alternative is to butt-splice the connection. A butt splice is an open-ended copper cylinder. The object is to stick the stripped end of one wire in one end and the stripped end of the other wire into the opposite end. The cylinder is then crushed to mechanically lock the splice to the stranded wire.

The advantages of butt-splicing include proper alignment of the junction with the lay of the wire and lack of capillary stiffening associated with solder and solder flux. Butt splices can also be used on nonsolderable wires such as stranded stainless steel.

On the short side, the butt splice alone, even with its plastic overshield, cannot protect the joint from the elements. Getting the metal part of the splice to crush evenly depends on the material the splice is made of and the tool used to deform it. Often, the size of the butt splice chosen doesn't match well with the wire size. This leads to poor crimping and the possibility that the crush of the splice is not really holding the wire securely.

Like a lot of other things, there are butt splices and then there are butt splices. The cheap ones usually have an overcoat sleeve made of brittle PVC. When you crimp it, the blue plastic turns white and often pushes the tool away from a clean, even crimp. The ones they sell to professional electricians have a polyethylene overcoat that's softer, more compliant and easier to crimp. Personally, I prefer the T&B (Thomas & Betts) brand.

If you distort a butt splice by using a cheap crimping tool, don't expect good results. The same also applies to ring lugs, forks and other popular types of crimp terminals. The Klein Tool Co. makes a crimp tool for professional electricians. Like lots of other tools, if you buy a good one to start

with, it'll last you a lifetime.

In the end, it's hard to say which connection method is best. My experience is that, on average, the butt splice, if made with the proper crimping tool, offers the simplest connection with the best results. Just be sure the butt splice you use matches closely sizewise with the wire you're splicing. The end-to-end solder joint can also work quite well, if you don't go crazy piling on too much solder.

Once the joint is complete, the next step is to insulate it. Here, the possibilities are almost endless—PVC electrical tape, friction tape, silicone RTV, heat-shrink tubing, etc. Probably the poorest choice is that 89-cent roll of PVC tape. Because of its poor flexibility, especially when cold, the tape almost always separates from the joint. Instead of holding moisture away from the connection, it acts as a poultice, holding the crud and other stuff in contact with the metals of the joint.

Friction tape might actually be better (if for no other reason than its heavy goo/tar/asphalt coating protects the joint just as much as the fiber of the tape itself.

While it won't work on a right-angle joint, by far the best sealing alternative is heat-shrink tubing. Usually about an inch long, this tubing is cut to fit from 10-inch pieces commonly available at electronics supply shops. The inside diameter of the tubing can be two or three times that of the wire when you put it on before making the solder or butt splice joint. The best way to cure it is with a hot air gun, although you can limp along with a hair dryer. The key to using it is to make sure there's plenty of contact between the tube and the wire insulation on either side once the tubing has been shrunk to fit. That way, there's plenty of distance to prevent moisture from creeping between the wire and the heat-shrink tubing. You should figure a coverage of at least ½ to ¾ inch beyond either side of the joint.

"My experience is that, on average, the butt splice, if made with the proper crimping tool, offers the simplest connection with the best results."

Once each individual wire is sealed up, you need to install the wire harness in its original location with the strain relief properly positioned. As we said earlier, the individual wires and the wire harness form a lever that acts on the terminations at each end. If you leave it out there flopping around, eventually it damages either the end connections or the cable itself.

SAMPLE "PUT ON NOTICE" LETTER

FOR FORD

BLOWER MOTOR RESISTER FAILURES

CERTIFIED MAIL - RETURN RECEIPT -REQUESTED

Ford Motor Company
Parklane Tower West
Suite 300
3 Parklane Blvd.
Dearborn, NU. 48126

ATTN: Mr. Howard E. Keys
Mgr.- Product Claims Dept.

Re: Our Claim #
Our insured:
Date of loss:
Vehicle Data: 19XX Ford xxxxxxxxxx
VIN xxxxxxxxxxxxxxxxx

This State Farm insured vehicle was involved in a non collision vehicle fire (while being driven, or after parking, or while idling). Damage to the vehicle resulted in a (total or partial) loss of $xx,xxx

Our investigation reveals the cause of the fire to be related to failure of the blower motor resistor.

Enclosed is documentation of our claim (including our experts report, or drivers statement, or affidavit, or invoices). We are holding the vehicle for xx days in the event you wish to make an inspection. You may contact me at (xxx)xxx-xxxx to make arrangements.

Please consider this letter as our claim to Ford Motor Company to reimburse State Farm for its interest of $xx,xxx.

Very Truly Yours,

John Doe
Claim Specialist

Overview of Recall 439
ans. 1982

Subject:
Service Recall 439 - Certain 1982 Escort, Lynx, and LN7 Vehicles for Replacement of Air Conditioner (A/C) Blower Motor Resistor Assembly.

Description Of Defect And Correction

Ford Motor Company has determined that a defect involving motor vehicle safety exists in certain 1982 Escort, Lynx, and LN7 vehicles with optional factory installed air conditioning. With the blower motor switch in the medium-low position, the possibility exists that a resistor in the motor's electrical circuit could overheat in the event that the blower became stuck or jammed for some unrelated reason. An overheating resistor could eventually melt and ultimately ignite the air conditioner case (located under the instrument panel), producing a fire which potentially could spread to other flammable materials inside the vehicle.

Ford is recalling these vehicles to correct this condition. The blower motor resistor assembly will be replaced with a new assembly having a lower effective heat range thermal limiter to ensure electrical current interruption should it be needed. All affected vehicles are to have the new resistor assemblies installed. An initial supply of the replacement resistor assemblies, part number E2PZ-19A706-A, will be one-time direct shipped to all dealers in early June, 1982, in coordination with owner notifications. Dealers should order additional parts, as needed, from Wixom using the mailing address found in this Bulletin.

Vehicles Affected	Assembly Plant	Production Dates From Through
Escort and Lynx	Edison	8/10/81 2/25/82
	Wayne	7/27/81 3/10/82
	St. Thomas	8/10/81 3/01/82
	San Jose	9/08/81 2/25/82
EXP and LN7	San Jose	9/08/81 2/25/82
	St. Thomas	8/10/81 3/01/82

Vehicles involved in this recall are all 1982 Escort, Lynx, EXP and LN7 with factory installed air conditioning built at the assembly plants during the periods shown in illustration.

Plaintiffs

v.

FORD MOTOR COMPANY
Defendant

IN THE COUNTY COURT

AT LAW NUMBER 2

TRAVIS COUNTY, TEXAS

FILED
96 DEC -5 PM 4:44
DANA DeBEAUVOIR
COUNTY CLERK
TRAVIS COUNTY, TEXAS

ORIGINAL PETITION

TO THE HONORABLE JUDGE OF SAID COURT:

COME NOW [redacted] and [redacted] ("Plaintiffs") and file this Original Petition against Ford Motor Company ("Defendant") and for cause would show the following:

I.
PARTIES

Plaintiffs are individuals residing in the State of Texas.

Defendant is a company duly licensed and doing business in the State of Texas. It may be served through its registered agent for service of process, CT Corporation Systems, 350 North St. Paul Street, Dallas, TX 75201.

II.
BACKGROUND FACTS

On June 10, 1996, Plaintiffs' 1992 Ford Crown Victoria caught fire due to a defect or malfunction causing an overheating condition within the wiring or connections in the electrical distribution box. As a result of this, Plaintiffs sustained $11,026.63 in damages.

III.

DEFECTIVE PRODUCT

At the time of this occurrence, Defendant was engaged in the business of designing, manufacturing and marketing automobiles, including the one made the basis of this claim, for

[redacted]

CL
4/3/97

sale to and for use by members of the general public. Plaintiff would show that the automobile in question (V.I.N. 2FACP73W6NX155863) was defective and unsafe for its intended purposes at the time it left the control of Defendant, in that it was defectively designed and/or manufactured in a manner which made the product unreasonably and inherently dangerous. Plaintiff would further show that the automobile in question was defectively marketed by Defendant in that Defendant failed to adequately warn or instruct consumers, including Plaintiff, of the dangers associated with the product.

IV.
STRICT PRODUCT LIABILITY

Plaintiff invokes the doctrine of strict liability, Section 402A, RESTATEMENT (SECOND) OF TORTS, as adopted by the Supreme Court of Texas. Plaintiff alleges that Defendant is strictly liable for designing, manufacturing and marketing the automobile into the stream of commerce when the product was unreasonably dangerous. The defective design, manufacture and/or marketing of the automobile was the proximate cause of the occurrence and of Plaintiff's damages.

Plaintiff would further show that Defendant is strictly liable to Plaintiff under 402B of the RESTATEMENT (SECOND) OF TORTS for misrepresenting that the product was safe and without defect. These representations were false and involved a material fact concerning the character or quality of the automobile. Plaintiff would show that he relied on these representations and that Defendant's misrepresentations were the proximate cause of the occurrence and of Plaintiff's damages.

V.
NEGLIGENCE

Plaintiff alleges that Defendant was negligent in the design, manufacture and/or

marketing of the automobile, in that Defendant knew, or in the exercise of ordinary care, should have known, that the automobile was defective and unreasonably dangerous to ultimate consumers. Plaintiff would show that Defendant's negligent acts and/or omissions were the proximate cause of the occurrence and of Plaintiff's damages.

VI.
RES IPSA LOQUITUR

In that alternative, Plaintiff would further show that he cannot more specifically allege the specific acts of negligent design and manufacture on the part of Defendant, for the reason that the facts in that regard are peculiarly within the knowledge of Defendant, and in the event Plaintiff is unable to prove specific acts of negligent design and manufacture, Plaintiff relies on the doctrine of *res ipsa loquitur*. In this connection, Plaintiff will show that the design and manufacture of the automobile were within the exclusive control of Defendant. Plaintiff had no means of ascertaining the method or manner in which the automobile was designed or manufactured by Defendant. Plaintiff would show that the product came into his possession in the same condition it was in when it left the control of Defendant. The occurrence causing harm to Plaintiff was one which, in the ordinary course of events, would not have occurred without negligence on the part of Defendant. Plaintiff would show that Defendant' negligent acts and/or omissions were the proximate cause of Plaintiff's damages.

VII.
BREACH OF WARRANTY

Plaintiff further alleges that Defendant expressly and impliedly warranted to the public that the automobile was of merchantable quality and was safe and fit for the purposes intended when used under ordinary conditions and in an ordinary manner. Plaintiff would show that Defendant' breach of these warranties were the proximate cause of the occurrence

and of Plaintiff's damages. TEX. BUS. & COM. CODE Sec. 2.314 - 2.315, Sec. 17.50 (a)(2), (Vernon 1989). Plaintiff would further show that Defendant is liable for all attorney fee's pursuant to §38.001 of the Texas Civil Practice & Remedies Code.

VII.
DECEPTIVE TRADE PRACTICES ACT

Plaintiff would show that Defendant is also liable for violations of the Texas Deceptive Trade Practices and Consumer Protection Act ("DTPA"), including:

A. Representations that the product in question, and its component parts, possessed qualities, characteristics, uses and benefits which they did not possess - [TEX. BUS & COM. CODE §17.46(5), (Vernon 1990)];

B. Representations that the product in question, and its component parts, were merchantable when, in fact, they were not fit for the ordinary purposes for which such products were to be used - [TEX. BUS & COM. CODE §17.46(19), (Vernon 1990)];

C. Failing to disclose information concerning dangers of the automobile known to Defendant, when such failure was intended to induce the consumer to purchase the product - [TEX. BUS & COM. CODE §17.46(22), (Vernon 1990)];

The above acts and/or omissions of Defendant were a proximate cause of the occurrence and of Plaintiff's $11,026.63 damage to his real and personal property.

Pursuant to the common law of Texas and to the various statutes referenced herein, Defendant is liable to Plaintiff for actual and treble damages, interest, court costs, and reasonable attorney fees.

WHEREFORE, PREMISES CONSIDERED, Plaintiff requests that Defendant be cited to appear and answer, and that on final trial, Plaintiff have:

1. Judgment against the defendant for a sum in excess of the minimum jurisdictional limits of the Court;

2. Pre-judgment interest and post-judgment interest as provided by law;

3. Costs of suit;

4. Attorney fees;

5. Such other and further relief to which the she may be justly entitled.

ASSIGNMENT

This assignment was received July 15, 1996 at 1:16 p.m. via FAX from Property Claim Trainer Michael Huck with instructions to conduct a vehicle fire cause examination. Investigation commenced 8/14/96.

ENCLOSURES

1. 29 vehicle photographs

INSURED PROPERTY

The risk is a dark blue, 1992 Ford Crown Victoria, four door sedan bearing Texas license plate PCW-68Z. The vehicle identification number is 2FACP73W6NX155863. The car is powered by a large displacement, fuel injected, V-8 motor and automatic transmission. It is equipped with power steering, power brakes, electric door locks and windows, dash mounted radio, cruise control and all season heating and air conditioning. All four tires and simulated wire wheel hubcaps were still on the vehicle. The body was straight and I saw no evidence of prior collision damage. According to the odometer, there were 58,865 miles on the car.

VEHICLE EXAMINATION

NOTE: *All references to sides and corners are made as if you were sitting in the driver's seat.*

A vehicle fire cause examination was conducted on Wednesday, 8/14/96 commencing at 12:45 p.m. at the Insurance Auto Auctions storage and sale facility, 4701 Agnes Street, Corpus Christi, Texas. The risk was photographed and diagrammed at that time. There were no adverse conditions or appreciable alterations to the car, therefore, a true and accurate fire cause determination was possible. I was the only person present during this portion of the investigation.

From an exterior examination it was almost impossible to tell a fire had occurred. None of the exterior paint was burned or blistered and all window glass was still intact. Once the hood was raised, a minor amount of paint damage and heat stress was present on the underside, near the right front corner (photo #7).

Even with the hood open it was difficult to tell a fire had occurred until some significant burning to the right front inner fender well was noted (photo #8). This corresponds with the damaged paint and heat stress to the underside of the hood. Virtually all combustibles, including hoses, belts, plastic parts and wiring insulation, were still intact. This was especially true on the left side of the engine compartment where no burning was noted to any of the various components (photo # 9).

The left side was the area where the rubber fuel lines and quick-connectors were routed. They were attached to the fuel rail on the left side of the motor and had obviously not received any fire damage (photo #10). It has been my experience that fires caused by an electrical defect or malfunction are much more centralized then those involving flammable or combustible liquids. Even the fire damage on the right side of the V-8 motor was minimal (photo #11).

All of the burning was clearly localized to the extreme, right front corner of the engine compartment (photo #12). The twelve volt battery had been removed prior to my examination but I did not see any localized burning to the battery tray or nearby sheet metal (photo #13). The most intense burning was clearly localized around the forward end of an electrical block and fuse panel. I did see that one of the bare wires had became unattached from a fitting or connection (photo #14).

The wires were closely examined; however, I did not see any evidence of arcing or shorting on the bare copper conductors. The separated end is the only evidence of

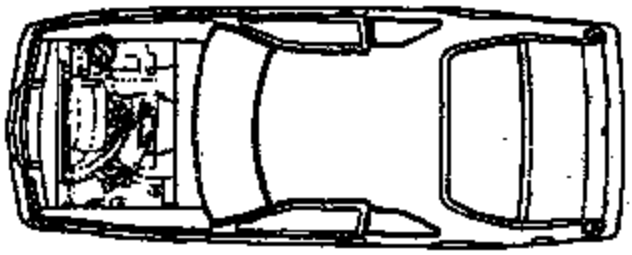
separation possibly due to an arc or short circuit. A check of a repair manual indicated the correct name for the electrical block/fuse panel was the "electrical distribution box". It had apparently been bolted to the inner fender well as the mounting studs and nuts were still attached (photo #15).

When the electrical distribution box was picked up and more closely examined, I saw an eyelet, solderless terminal, attached to a large electrical lug, was the area where the separated wire had been connected (photo #16). The interior of the electrical distribution box also exhibited fairly heavy fire damage (photo #18).

Once the fuse box cover was removed, it was evident the only fire damage was to two of the large fuses on the rear of the panel (photo #19). The bottom cover was removed from the electrical distribution box at which time I noted an interior cover was burned approximately half way off (photo #20). The burning to the underside of the component was clearly localized with fire damage to three of the wires (photo #21).

A check of the fuse panel revealed two of the blade type fuses had blown. In this instance, the short circuit was sufficient to "weld or bond" one of the fuse legs to the mounting slot. These fuses were removed which confirmed the heavy damage to each one (photos #23 & 24).

After more of the plastic case, on the power distribution block, was removed, burning was noted to the base of the fuse receptacles. This is clearly internal, localized heating coming from a wire or connection on the power distribution box. In this instance, I feel an arc or spark occurred between the wire attached to the electrical lug with the eyelet, solderless, terminal (photo #29). The following conceptual diagram shows the engine compartment of the risk, the location of the power distribution box and the specific area *where* the fire originated.



DETERMINATION OF FIRES CAUSE

Based on physical evidence remaining on the vehicle and information obtained from various sources, it is my opinion this was an accidental fire. It occurred from an unspecified defect or malfunction which caused an overheating condition within the wiring or connections in the electrical distribution box.

COMMENTS

With the completion of my investigation, I feel the cause of this fire has been well documented. The minor amount of burning is clearly centered around the power distribution box and the area where the wire came off the solderless terminal could have caused resistance heating or a short circuit. Although this car was approximately four years old, it appeared to be in very good shape and I saw no evidence of abuse, neglect, alterations or non-OEM parts. If the electrical system, specifically the power distribution box, has not been worked on then whatever caused this fire was built into the car at the assembly plant.

Although no additional investigation is anticipated, I am leaving this file open for 30 days to allow you sufficient time for review and evaluation. If either yourself or Mr. Huck have any further instructions, questions or information, please feel free to call at anytime. As always, I can be contacted through my Irving, Texas office or my digital pager.

Respectfully Submitted,

ORIGINAL PETITION

TO THE HONORABLE JUDGE OF SAID COURT:

COME NOW [redacted] and [redacted] ("Plaintiffs") and file this Original Petition against Ford Motor Company ("Defendant") and for cause would show the following:

I.
PARTIES

Plaintiffs are individuals residing in the State of Texas.

Defendant is a company duly licensed and doing business in the State of Texas. It may be served through its registered agent for service of process, CT Corporation Systems, 350 North St. Paul Street, Dallas, TX 75201.

II.
BACKGROUND FACTS

On June 10, 1996, Plaintiffs' 1992 Ford Crown Victoria caught fire due to a defect or malfunction causing an overheating condition within the wiring or connections in the electrical distribution box. As a result of this, Plaintiffs sustained $11,026.63 in damages.

III.

DEFECTIVE PRODUCT

At the time of this occurrence, Defendant was engaged in the business of designing, manufacturing and marketing automobiles, including the one made the basis of this claim, for

2982-025 28382

sale to and for use by members of the general public. Plaintiff would show that the automobile in question (V.I.N. 2FACP73W6NX155863) was defective and unsafe for its intended purposes at the time it left the control of Defendant, in that it was defectively designed and/or manufactured in a manner which made the product unreasonably and inherently dangerous. Plaintiff would further show that the automobile in question was defectively marketed by Defendant in that Defendant failed to adequately warn or instruct consumers, including Plaintiff, of the dangers associated with the product.

IV.
STRICT PRODUCT LIABILITY

Plaintiff invokes the doctrine of strict liability, Section 402A, RESTATEMENT (SECOND) OF TORTS, as adopted by the Supreme Court of Texas. Plaintiff alleges that Defendant is strictly liable for designing, manufacturing and marketing the automobile into the stream of commerce when the product was unreasonably dangerous. The defective design, manufacture and/or marketing of the automobile was the proximate cause of the occurrence and of Plaintiff's damages.

Plaintiff would further show that Defendant is strictly liable to Plaintiff under 402B of the RESTATEMENT (SECOND) OF TORTS for misrepresenting that the product was safe and without defect. These representations were false and involved a material fact concerning the character or quality of the automobile. Plaintiff would show that he relied on these representations and that Defendant's misrepresentations were the proximate cause of the occurrence and of Plaintiff's damages.

V.
NEGLIGENCE

Plaintiff alleges that Defendant was negligent in the design, manufacture and/or

marketing of the automobile, in that Defendant knew, or in the exercise of ordinary care, should have known, that the automobile was defective and unreasonably dangerous to ultimate consumers. Plaintiff would show that Defendant's negligent acts and/or omissions were the proximate cause of the occurrence and of Plaintiff's damages.

VI.
RES IPSA LOQUITUR

In that alternative, Plaintiff would further show that he cannot more specifically allege the specific acts of negligent design and manufacture on the part of Defendant, for the reason that the facts in that regard are peculiarly within the knowledge of Defendant, and in the event Plaintiff is unable to prove specific acts of negligent design and manufacture, Plaintiff relies on the doctrine of *res ipsa loquitur*. In this connection, Plaintiff will show that the design and manufacture of the automobile were within the exclusive control of Defendant. Plaintiff had no means of ascertaining the method or manner in which the automobile was designed or manufactured by Defendant. Plaintiff would show that the product came into his possession in the same condition it was in when it left the control of Defendant. The occurrence causing harm to Plaintiff was one which, in the ordinary course of events, would not have occurred without negligence on the part of Defendant. Plaintiff would show that Defendant' negligent acts and/or omissions were the proximate cause of Plaintiff's damages.

VII.
BREACH OF WARRANTY

Plaintiff further alleges that Defendant expressly and impliedly warranted to the public that the automobile was of merchantable quality and was safe and fit for the purposes intended when used under ordinary conditions and in an ordinary manner. Plaintiff would show that Defendant' breach of these warranties were the proximate cause of the occurrence

and of Plaintiff's damages. TEX. BUS. & COM. CODE Sec. 2.314 - 2.315, Sec. 17.50 (a)(2), (Vernon 1989). Plaintiff would further show that Defendant is liable for all attorney fee's pursuant to §38.001 of the Texas Civil Practice & Remedies Code.

VII.
DECEPTIVE TRADE PRACTICES ACT

Plaintiff would show that Defendant is also liable for violations of the Texas Deceptive Trade Practices and Consumer Protection Act ("DTPA"), including:

A. Representations that the product in question, and its component parts, possessed qualities, characteristics, uses and benefits which they did not possess - [TEX. BUS & COM. CODE §17.46(5), (Vernon 1990)];

B. Representations that the product in question, and its component parts, were merchantable when, in fact, they were not fit for the ordinary purposes for which such products were to be used - [TEX. BUS & COM. CODE §17.46(19), (Vernon 1990)];

C. Failing to disclose information concerning dangers of the automobile known to Defendant; when such failure was intended to induce the consumer to purchase the product - [TEX. BUS & COM. CODE §17.46(22), (Vernon 1990)];

The above acts and/or omissions of Defendant were a proximate cause of the occurrence and of Plaintiff's $11,026.63 damage to his real and personal property.

Pursuant to the common law of Texas and to the various statutes referenced herein, Defendant is liable to Plaintiff for actual and treble damages, interest, court costs, and reasonable attorney fees.

WHEREFORE, PREMISES CONSIDERED, Plaintiff requests that Defendant be cited to appear and answer, and that on final trial, Plaintiff have:

1. Judgment against the defendant for a sum in excess of the minimum jurisdictional limits of the Court;

2. Pre-judgment interest and post-judgment interest as provided by law;

3. Costs of suit;

4. Attorney fees;

5. Such other and further relief to which the she may be justly entitled.

Respectfully submitted,

F. I. R. E.

150BB96 1. [redacted]

ASSIGNMENT

This assignment was received July 15, 1996 at 1:16 p.m. via FAX from Property Claim Trainer Michael Huck with instructions to conduct a vehicle fire cause examination. Investigation commenced 8/14/96.

ENCLOSURES

1. 29 vehicle photographs

INSURED PROPERTY

The risk is a dark blue, 1992 Ford Crown Victoria, four door sedan bearing Texas license plate PCW-68Z. The vehicle identification number is 2FACP73W6NX155863. The car is powered by a large displacement, fuel injected, V-8 motor and automatic transmission. It is equipped with power steering, power brakes, electric door locks and windows, dash mounted radio, cruise control and all season heating and air conditioning. All four tires and simulated wire wheel hubcaps were still on the vehicle. The body was straight and I saw no evidence of prior collision damage. According to the odometer, there were 58,865 miles on the car.

VEHICLE EXAMINATION

NOTE: *All references to sides and corners are made as if you were sitting in the driver's seat.*

A vehicle fire cause examination was conducted on Wednesday, 8/14/96 commencing at 12:45 p.m. at the Insurance Auto Auctions storage and sale facility, 4701 Agnes Street, Corpus Christi, Texas. The risk was photographed and diagrammed at that time. There were no adverse conditions or appreciable alterations to the car; therefore, a true and accurate fire cause determination was possible. I was the only person present during this portion of the investigation.

From an exterior examination it was almost impossible to tell a fire had occurred. None of the exterior paint was burned or blistered and all window glass was still intact. Once the hood was raised, a minor amount of paint damage and heat stress was present on the underside, near the right front corner (photo #7).

Even with the hood open it was difficult to tell a fire had occurred until some significant burning to the right front inner fender well was noted (photo #8). This corresponds with the damaged paint and heat stress to the underside of the hood. Virtually all combustibles, including hoses, belts, plastic parts and wiring insulation, were still intact. This was especially true on the left side of the engine compartment where no burning was noted to any of the various components (photo # 9).

The left side was the area where the rubber fuel lines and quick-connectors were routed. They were attached to the fuel rail on the left side of the motor and had obviously not received any fire damage (photo #10). It has been my experience that fires caused by an electrical defect or malfunction are much more centralized then those involving flammable or combustible liquids. Even the fire damage on the right side of the V-8 motor was minimal (photo #11).

All of the burning was clearly localized to the extreme, right front corner of the engine compartment (photo #12). The twelve volt battery had been removed prior to my examination but I did not see any localized burning to the battery tray or nearby sheet metal (photo #13). The most intense burning was clearly localized around the forward end of an electrical block and fuse panel. I did see that one of the bare wires had became unattached from a fitting or connection (photo #14).

The wires were closely examined; however, I did not see any evidence of arcing or shorting on the bare copper conductors. The separated end is the only evidence of

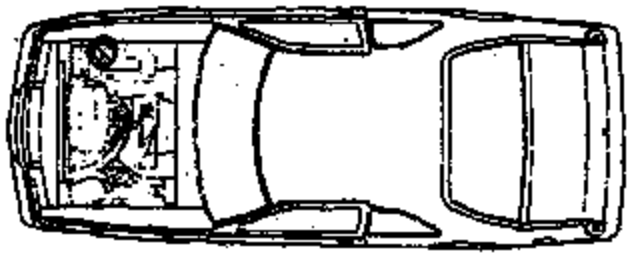
separation possibly due to an arc or short circuit. A check of a repair manual indicated the correct name for the electrical block/fuse panel was the "electrical distribution box". It had apparently been bolted to the inner fender well as the mounting studs and nuts were still attached (photo #15).

When the electrical distribution box was picked up and more closely examined, I saw an eyelet, solderless terminal, attached to a large electrical lug, was the area where the separated wire had been connected (photo #16). The interior of the electrical distribution box also exhibited fairly heavy fire damage (photo #18).

Once the fuse box cover was removed, it was evident the only fire damage was to two of the large fuses on the rear of the panel (photo #19). The bottom cover was removed from the electrical distribution box at which time I noted an interior cover was burned approximately half way off (photo #20). The burning to the underside of the component was clearly localized with fire damage to three of the wires (photo #21).

A check of the fuse panel revealed two of the blade type fuses had blown. In this instance, the short circuit was sufficient to "weld or bond" one of the fuse legs to the mounting slot. These fuses were removed which confirmed the heavy damage to each one (photos #23 & 24).

After more of the plastic case, on the power distribution block, was removed, burning was noted to the base of the fuse receptacles. This is clearly internal, localized heating coming from a wire or connection on the power distribution box. In this instance, I feel an arc or spark occurred between the wire attached to the electrical lug with the eyelet, solderless, terminal (photo #29). The following conceptual diagram shows the engine compartment of the risk, the location of the power distribution box and the specific area *where* the fire originated.



[redacted]

F.I.R.E.

150BB96 4. [redacted]

DETERMINATION OF FIRES CAUSE

Based on physical evidence remaining on the vehicle and information obtained from various sources, it is my opinion this was an accidental fire. It occurred from an unspecified defect or malfunction which caused an overheating condition within the wiring or connections in the electrical distribution box.

COMMENTS

With the completion of my investigation, I feel the cause of this fire has been well documented. The minor amount of burning is clearly centered around the power distribution box and the area where the wire came off the solderless terminal could have caused resistance heating or a short circuit. Although this car was approximately four years old, it appeared to be in very good shape and I saw no evidence of abuse, neglect, alterations or non-OEM parts. If the electrical system, specifically the power distribution box, has not been worked on then whatever caused this fire was built into the car at the assembly plant.

Although no additional investigation is anticipated, I am leaving this file open for 30 days to allow you sufficient time for review and evaluation. If either yourself or Mr. Huck have any further instructions, questions or information, please feel free to call at anytime. As always, I can be contacted through my Irving, Texas office or my digital pager.

Respectfully Submitted,

Byron R. Bryson

IN THE COUNTY COURT

AT LAW NUMBER 2

TRAVIS COUNTY, TEXAS

96 DEC -5 PM 1:14

DISTRICT CLERK
TRAVIS COUNTY, TEXAS

11-1-13

ORIGINAL PETITION

TO THE HONORABLE JUDGE OF SAID COURT:

COME NOW [redacted] and [redacted] ("Plaintiffs") and file this Original Petition against Ford Motor Company ("Defendant") and for cause would show the following:

I.
PARTIES

Plaintiffs are individuals residing in the State of Texas.

Defendant is a company duly licensed and doing business in the State of Texas. It may be served through its registered agent for service of process, CT Corporation Systems, 350 North St. Paul Street, Dallas, TX 75201.

II.
BACKGROUND FACTS

On June 10, 1996, Plaintiffs' 1992 Ford Crown Victoria caught fire due to a defect or malfunction causing an overheating condition within the wiring or connections in the electrical distribution box. As a result of this, Plaintiffs sustained $11,026.63 in damages.

III.

DEFECTIVE PRODUCT

At the time of this occurrence, Defendant was engaged in the business of designing, manufacturing and marketing automobiles, including the one made the basis of this claim, for

sale to and for use by members of the general public. Plaintiff would show that the automobile in question (V.I.N. 2FACP73W6NX155863) was defective and unsafe for its intended purposes at the time it left the control of Defendant, in that it was defectively designed and/or manufactured in a manner which made the product unreasonably and inherently dangerous. Plaintiff would further show that the automobile in question was defectively marketed by Defendant in that Defendant failed to adequately warn or instruct consumers, including Plaintiff, of the dangers associated with the product.

IV.
STRICT PRODUCT LIABILITY

Plaintiff invokes the doctrine of strict liability, Section 402A, RESTATEMENT (SECOND) OF TORTS, as adopted by the Supreme Court of Texas. Plaintiff alleges that Defendant is strictly liable for designing, manufacturing and marketing the automobile into the stream of commerce when the product was unreasonably dangerous. The defective design, manufacture and/or marketing of the automobile was the proximate cause of the occurrence and of Plaintiff's damages.

Plaintiff would further show that Defendant is strictly liable to Plaintiff under 402B of the RESTATEMENT (SECOND) OF TORTS for misrepresenting that the product was safe and without defect. These representations were false and involved a material fact concerning the character or quality of the automobile. Plaintiff would show that he relied on these representations and that Defendant's misrepresentations were the proximate cause of the occurrence and of Plaintiff's damages.

V.
NEGLIGENCE

Plaintiff alleges that Defendant was negligent in the design, manufacture and/or

marketing of the automobile, in that Defendant knew, or in the exercise of ordinary care, should have known, that the automobile was defective and unreasonably dangerous to ultimate consumers. Plaintiff would show that Defendant's negligent acts and/or omissions were the proximate cause of the occurrence and of Plaintiff's damages.

VI.
RES IPSA LOQUITUR

In that alternative, Plaintiff would further show that he cannot more specifically allege the specific acts of negligent design and manufacture on the part of Defendant, for the reason that the facts in that regard are peculiarly within the knowledge of Defendant, and in the event Plaintiff is unable to prove specific acts of negligent design and manufacture, Plaintiff relies on the doctrine of *res ipsa loquitur*. In this connection, Plaintiff will show that the design and manufacture of the automobile were within the exclusive control of Defendant. Plaintiff had no means of ascertaining the method or manner in which the automobile was designed or manufactured by Defendant. Plaintiff would show that the product came into his possession in the same condition it was in when it left the control of Defendant. The occurrence causing harm to Plaintiff was one which, in the ordinary course of events, would not have occurred without negligence on the part of Defendant. Plaintiff would show that Defendant' negligent acts and/or omissions were the proximate cause of Plaintiff's damages.

VII.
BREACH OF WARRANTY

Plaintiff further alleges that Defendant expressly and impliedly warranted to the public that the automobile was of merchantable quality and was safe and fit for the purposes intended when used under ordinary conditions and in an ordinary manner. Plaintiff would show that Defendant' breach of these warranties were the proximate cause of the occurrence

and of Plaintiff's damages. TEX. BUS. & COM. CODE Sec. 2.314 - 2.315, Sec. 17.50 (a)(2), (Vernon 1989). Plaintiff would further show that Defendant is liable for all attorney fee's pursuant to §38.001 of the Texas Civil Practice & Remedies Code.

VII.
DECEPTIVE TRADE PRACTICES ACT

Plaintiff would show that Defendant is also liable for violations of the Texas Deceptive Trade Practices and Consumer Protection Act ("DTPA"), including:

A. Representations that the product in question, and its component parts, possessed qualities, characteristics, uses and benefits which they did not possess - [TEX. BUS & COM. CODE §17.46(5), (Vernon 1990)];

B. Representations that the product in question, and its component parts, were merchantable when, in fact, they were not fit for the ordinary purposes for which such products were to be used - [TEX. BUS & COM. CODE §17.46(19), (Vernon 1990)];

C. Failing to disclose information concerning dangers of the automobile known to Defendant, when such failure was intended to induce the consumer to purchase the product - [TEX. BUS & COM. CODE §17.46(22), (Vernon 1990)];

The above acts and/or omissions of Defendant were a proximate cause of the occurrence and of Plaintiff's $11,026.63 damage to his real and personal property.

Pursuant to the common law of Texas and to the various statutes referenced herein, Defendant is liable to Plaintiff for actual and treble damages, interest, court costs, and reasonable attorney fees.

WHEREFORE, PREMISES CONSIDERED, Plaintiff requests that Defendant be cited to appear and answer, and that on final trial, Plaintiff have:

1. Judgment against the defendant for a sum in excess of the minimum jurisdictional limits of the Court;

2. Pre-judgment interest and post-judgment interest as provided by law;

3. Costs of suit;

4. Attorney fees;

5. Such other and further relief to which the she may be justly entitled.

Respectfully submitted,
