From: Rahman, Aziz
Subject: Switch Log and Eval. Procedure

cc: "Beringhause, Steven"<sberinghause@email.mc.ti.com>,
"Dague, Bryan"<bdague@email.mc.ti.com>,
"Baumann, Russ"<rbaumann@email.mc.ti.com>,
"McGuirk, Andy"<a-mcguirk@email.mc.ti.com>,
"Sharpe, Robert"<rsharpe@email.mc.ti.com>

Updated as of 2/18/99. There were some switches from the initial 24 switch survey that were opened up at AVT and the tag and switch parts were not kept together. I have noted this in the log.

Since the tag numbers for every incoming shipment start from 1, I suggest we use VIN numbers to track the database. This will uniquely identify the switch.

I suggest that the switch analysis priority be as follows:

- Switches from underhood fires, which have not been severely damaged
- Switches from Town Cars, starting by highest mileage and descending
- Switches from CV and GM, starting by highest mileage and descending
- Severely damaged switches from underhood fires
- Disassembled switches, with suspect paperwork trail

<<SwitchLog>>
Evaluation Procedure updated as of 2/18/99. Note identification of harness wires by color.

<<EVALPROC>>
I think we are closing in on finalizing the log format and the evaluation procedures. I believe that these are good enough for us to start using them for data entry.

In order to reduce confusion, I will plan on updating the log once a week. Please delete the earlier versions, so that you have only one latest copy.

Please comment.

Thanks
Aziz

FROM: John Joyce USART(UTC -05:00)
Subject: (U)Pressure Tests

Steve,

I got your note and will be on vacation tomorrow through Wednesday. Here's the info.

The more I think about this, the more I think TC activation may be the mechanism.

I am not sure of the order of the things connected and that can influence the low frequency amplitude of the signals. But the short answer is to instrument for 0-250 Bar and sample at 1 kHz or more.

Since I'm not sure of where the pressure switch is hydraulically connected I'll give you pressures at nodes and states I do know. The worst case for the switch would be to be connected between the HCU and the prop valve, which is where I think it is.

This is the low frequency component of the signal, I'll talk about the high-frequency component further down.

MC - HCU NODE
Maximum Pressure - ~175 Bar
Achieved by getting maximum vacuum (high revving engine and suddenly close throttle) then standing on the pedal as hard as you can. I don't remember this number very well it might be as low as ~130 or as high as 220. It also depends on your leg strength. This type of pressure is VERY RARE at this node. For this car, the driver will typically apply <20 bar and very rarely exceed 50 bar.

HCU - PROP VALVE NODE
Standing Still - Same as MC pressure - see above.

ABS Maximum - ~110 Bar
This is achieved by loading to GVW and performing an ABS stop, you may find that you are pedal effort limited, not limited by ABS control. It's pretty rare to get this high of pressure in this mode.

TCS Maximum - ~180 Bar
This is a good candidate. On this vehicle because the HCU had to pump through the prop valve to do the brakes-only traction control, the pressures coming out of the HCU got very high. The pressure relief valve on the pump VERY OFTEN dictated the peak pressure which could be developed - not the control - put another way, because the pressure at the rear brake had to restrain the entire powertrain (no engine intervention) and push through a prop valve, it was often possible to drive through the TC - the engine could overpower the brakes, even though very high pressures were being generated at the HCU. The noise during TC activation in these applications was very dependant upon the pressure relief valve opening point. So the

pressure relief valve value got changed a few times over the years as performance was sacrificed for NVH. Also the tolerance on the pressure relief valves was fairly large - a total of 40 bar, at that time I believe. The pressure relief valve pressure might be anywhere from 90 to 180 bar depending on part-to-part variation and the design generation that was agreed upon.

You can achieve this easiest by getting the rear wheels off the ground and putting the car in drive. Get into the throttle hard, but not so hard that you drive out of first gear or faster than ~15 mph. If you maintain this for a while, the thermal model to protect the rear linings will disable the Traction Control. You will then need to wait for them to cool, before the function will be reenabled. You can dramatically accelerate the cooling time by cruising (without braking) at about 40 mph.

Typical drivers can regularly get high pressures in this mode.

PROP VALVE - REAR BRAKE MODE
ABS Maximum Pressure ~70 Bar
Load to GVW and perform an ABS stop at maximum pedal effort.

TCS Maximum Pressure ~100 Bar
This pressure level is strongly dependant upon the pressure relief valve level - see above.

Standing Still
Same as ABS Maximum Pressure

High Frequency Content
The high frequency content has two parts. If you are not in ABS or Traction Control there is practically no high frequency content - the pressure is modulated at <10 Hz. This is basically limited by Booster response times and hydraulic dampening in the ABS orifices.

High Frequency Content Due To Control
During ABS/TC events the pressure is changed in quick steps. Typically it will increase by ~10 Bar in a few milliseconds, and this type of change occurs about every 100ms. The pressure will decrease by about 20 Bar every 300 ms. There can be quite a bit of variation in these numbers, but those are pretty typical. (Actually the numbers I assigned were for ABS, swap "increase" and "decrease" for TC activation.)

High Frequency Content Due to Shock Waves
This is a secondary affect from the control. Generally it is worst right at the outlet of the HCU. It is dampened and dissipated the further you get from the HCU. The shock wave is generated from the cyclical pulsing of the pump as well as the sudden changes in pressure when a solenoid valve is snapped open or shut.

The amplitude of this can be really big - I haven't looked at it in this generation unit for a few years, but I think it's about 50 Bar peak-peak right at the HCU. It will fall off as you move further away from the HCU.

The frequency is pretty high and I think some components are above the 1 kHz level, but you can get a very good idea of the disturbances by sampling at ~1kHz.

Regards,
John Joyce

<<Brake Pressure Switch Evaluation Plan.xls>>

Team, please review evaluation plan. It is basically a collation of Steve R. and Norm's inputs. I will add the switch dissection section tomorrow. The pressure calibration station from TI is expected to arrive on Thursday and will probably reside at Central Labs due to availability of high pressure air.

Steve R, will Allan be available to perform the electrical characterizations data collection? I can definitely help with data analysis and maintenance of the database.

Please review the attachment and let's discuss tomorrow.

Thanks
Aziz.

FROM: Joseph S. Neme USART(UTC -05:00)
SUBJECT: (C) Questionaire
Gentlemen,

We have a central contact point for underhood fires at FCSD litigation prevention. He will work with EA or design analysis to investigate alleged underhood fires.

What is needed from you tomorrow is:

1) list of questions/info you need to know regarding a fire like
- where did fire originate
- was the vehicle running, parked, on/off... if off, how long
- did you notice brake warning lamp or speed control inop prior to fire
- VIN #, Miles, location of incident
- where is the vehicle now

2) identify a "flag" to signal a vehicle investigation like
- underhood fire
- vehicle available
- 92-95 Town Car, Crown Victoria, Grand Marquis
- fires that totaled a vehicle or don't know origin

3) identify vehicles we want to have EA have a look at right away (suggest working with ASO on present list of alleged incidents)

4) list of special request from the investigators... ie which parts to get

We need all this info tomorrow so that we can kick things off... thanks

Call me if you have questions

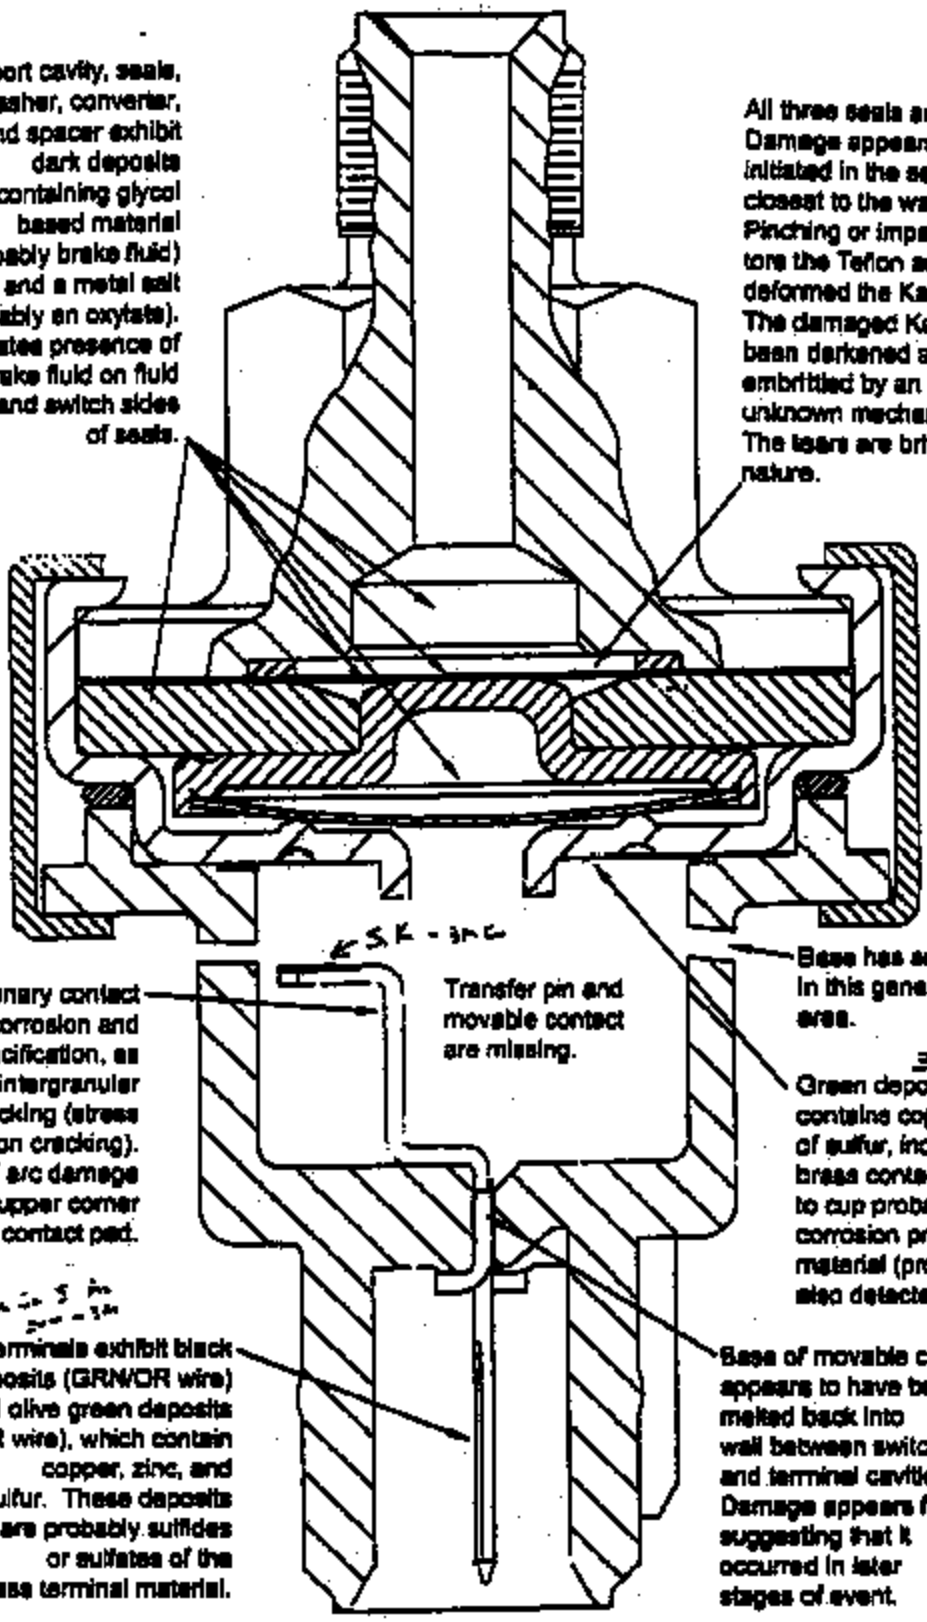
Memphis Switch



Hexport cavity, seals, washer, converter, and spacer exhibit dark deposits containing glycol based material (probably brake fluid) and a metal salt (probably an oxylate). Indicates presence of brake fluid on fluid and switch sides of seals.

All three seals are torn. Damage appears to have initiated in the seal closest to the washer. Pinching or impact tore the Teflon and deformed the Kapton. The damaged Kapton has been darkened and embrittled by an unknown mechanism. The tears are brittle in nature.

Base has separated in this general area.

Stationary contact exhibits corrosion and dezincification, as well as intergranular cracking (stress corrosion cracking). Small amount of arc damage at upper corner away from contact pad.

Transfer pin and movable contact are missing.

Green deposit on face of cup contains copper, zinc, and traces of sulfur, indicating transfer of brass contact material to cup probably as an oxide or corrosion product. Glycol based material (probably brake fluid) also detected in this area.

Terminals exhibit black deposits (GRN/OR wire) and olive green deposits (OR wire), which contain copper, zinc, and sulfur. These deposits are probably sulfides or sulfates of the brass terminal material.

Base of movable contact appears to have been melted back into wall between switch and terminal cavities. Damage appears fresh, suggesting that it occurred in later stages of event.

Wire cavity in connector (not shown) exhibits white deposits below seal, which contain elements typical of those found in dry chemical fire extinguishers.

TEXAS INSTRUMENTS

Materials & Controls Group
Automotive Business Unit

Low Cost Automotive Hydraulic Line Mount Pressure Switches

TI's pressure switches provide low cost, on/off controls for many automotive systems. The snap action disc reacts to changing pressure by reversing its curvature and activating electrical switch contacts.

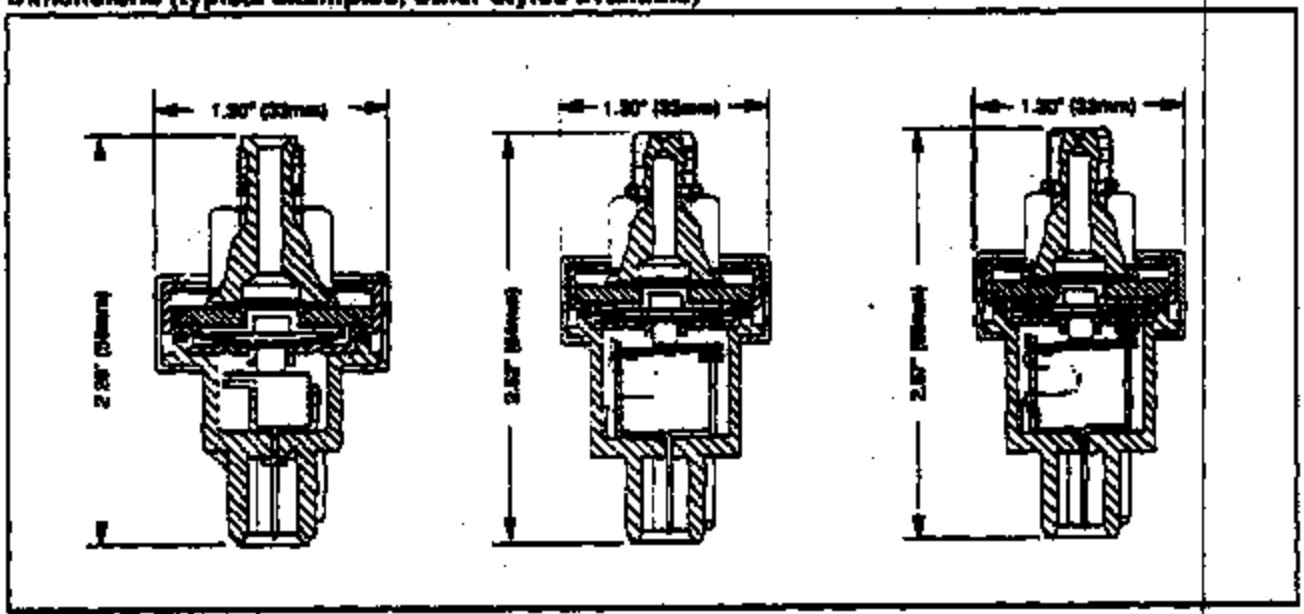
Key Features Include:

- Designed for underhood environment
- Low weight
- Custom packaging for specific application needs
- Automotive temperature range of -40 to 135°C
- Normally open and normally closed contact logic
- Industry proven since 1984

Typical Applications

- Power Steering Systems
- Cruise Control Systems
- Brake Systems
- Transmissions
- Suspension

Dimensions (typical examples, other styles available)



3713 1409

TEXAS INSTRUMENTS

Technical Specifications

Texas Instruments Incorporated
8-D Problem Resolution Report # PS/CAR/93-3 CLOSED 12/1/93

Original Report: July 29, 1993

Update Report: October 18, 1993
Ford Part Number: F3TA-9F924-AA/BA/CA
Part Description: Speed Control Deactivation Switch

(STEP 1) PRODUCT TEAM

Manufacturing Engineering: Matt Sellers
Quality Assurance Engineering: Jim Watt
Product Marketing: Charlie Douglas
Design Engineering: Asif Rahman (Champion)

(STEP 2) PROBLEM DESCRIPTION

Ford Light Truck Division Brake Engineering reported a noticeable increase in warranty returns, related to inoperative speed control systems for 1993 Econoline models during 4QTR'92 and 1QTR'93 time frame. Detailed breakdown of warranty data showed that a number of these claims were reported to be pressure switch related. Attachment "A" shows R/1000 data as collated from Ford warranty data. Texas Instruments and Ford started on 7/22/93 to call dealerships from the Master Claim list contacting over 150 dealerships. As of 10/18/93, (14) switches have been received, analyzed, and characterized.

The following table details the field data on these switches:

VID	Vehicle type	Switch date code
A84642	'93 Econoline	2316 (November '92)
A35294	'93 Econoline	2294
A40855	'93 Econoline	3078
A70383	'93 Econoline	2345
A61611	'93 Econoline	2345
A34137	'93 Econoline	2243
A32268	'93 Econoline	2286
A47374	'93 Econoline	2307
A50451	'93 Econoline	2316
A49359	'93 Econoline	2338
A57954	'93 Econoline	2345
A92609	'93 Econoline	3037
B15536	'93 Econoline	3078
A40855	'93 Econoline	3175

(13) switches were confirmed to be inoperative switches due to liquid ingress resulting in severe corrosion. Switch with date code 2307 was operating normally.

TO FIELD PORTER

3713 1411

(STEP 3) INTERIM CONTAINMENT ACTION

We have completed the following actions in assessing the integrity of our current product:

1. Verified environmental seal integrity and proper function.

2. Verified switch connector base dimensions that could affect the mating connector sealing ability to be within specification.

Based upon Texas Instruments' verification of the critical connector base dimensions, the functionality of the environmental seal, and observation of fluid ingress into the switch cavity through the terminal blades, an analysis/investigation of the mating connector sealing system is warranted.

3. Texas Instruments, in cooperation with Ford Light Truck Engineering, conducted a water ingress test with various component combinations of the mating connector, to determine relative susceptibility of each combination. The following combinations were tested:

Current Light Truck	Light Truck Before 11/92	Current Pass Car
Black UTA shell	Black EPC shell	Black UTA shell
Gray Grommet	Gray Grommet	Gray Grommet
Red Silicon Seal	Red Sponge Seal	Red Sponge Seal

The matrix of components tested and the test sequence is outlined in attached charts. Preliminary data analysis did not show significant differences amongst various matrix elements. It has been concluded that the switches need extended exposure under shower to initiate water ingress. In addition to the above combination of components, 50% of the switches were tested with a "rocked" connector.

The shower test was halted on 10/6/93, when non-normal insulation resistance readings were observed on rocked switches. Upon removal of the connectors, water ingress was observed on all switches with rocked connectors. There was no ingress on correctly latched switches. The attached Table 1 summarizes the matrix of parts and visual observations. The ingress in vertical switches was of a magnitude higher than in horizontal switches. Photographs of the switches were sent to Ford Light Truck Engineering for review. The switches were calibrated for functionality. The attached Table 2 confirms the effect of ingress as seen in the reduction of insulation resistance and intermittent operation of the switches. The switches were then disassembled for internal inspection. It was observed that the ingress had proceeded through the connector cavity into the contact zone. Photographs are attached.

The ingress activity on the rocked switches was similar to that observed on parts returned from the field, albeit of a lesser magnitude. It is believed that, given sufficient time (to allow current to pass though the contacts), the ingress on the rocked switches would exhibit exactly the same failure as that observed on the warranty parts.

(STEP 4) ROOT CAUSE

The switches analyzed were inoperative since there was no electrical continuity between the terminals. Attachment "B" shows the fishbone diagram for a stuck open switch. The lack of continuity was due to presence of large amounts of corrosion products inside the switch cavity and, in some cases, failure of contact elements due to corrosion. The large quantity of corrosion products is due to fluid that entered the switch cavity. Because of the severe amount of corrosion observed, it is believed that the corrosion is accelerated by the potential difference between the grounded body of the switch and current carrying members.

Thorough visual observation concluded the fluid entry to be through the mating connector end of the switch as evidenced by brass corrosion products along the terminal blades in the connector cavity (see attached photographs). Two of the switches exhibited blue/green corrosion by-products covering more than one half of the connector cavity. The others showed similar corrosion products but in lesser amounts. None of the switches showed any evidence of fluid ingress by the environmental seal.

The snap acting disc in all the returned switches was functioning normally.

The following observations were made by Texas Instruments on '93 Econoline and F-Series Trucks at a local Ford dealership:

1. Econoline: The wire leads coming out of the switch were routed below and touching the rear A/C line. This will create a propensity for water/condensation traveling along the line to flow along the wire leads to the grommet.

2. F-Series: The observed vehicles had a Red Sponge seal inside the mating connector, as opposed to the expected Red Silicone seal.

Additional observations regarding face seal variations:

1. The target zone for pressure switch sealing surface is smaller on the sponge seal, than the silicone seal. The smaller target zone, may lead to a sub-optimal sealing condition under worst case dimensional stack-up.

2. It has been seen that during the mating connector assembly process, there is an opportunity for the silicone seal to be rolled over. This can happen during insertion of the plastic terminal separator. The insertion is done after the silicone seal is placed in the plastic shell. A rolled over silicone seal would not provide protection against water ingress.

3. The silicone seal, by design, has a lower percent compression than the sponge seal. The design limits for the silicone seal are 10 - 15%, whereas the limits for the sponge seal are 38 - 50%. The reduction in percent compression was intended to maintain similar loading forces. It has been observed that there is a tendency for the mating connector to 'rock' in the latched position. The rocking tendency would lead to a higher percent change in the level of compression of the silicone seal than on the sponge seal.

The shower test detailed above, leads to the conclusion that a "rocked" connector was the most probable root cause of the observed problem. The impact of the problem is magnified in the Econoline platform due to the mounting location and vertical mounting position, both of which are unfavorable from a ingress point of view.

(STEP 5) PERMANENT CORRECTIVE ACTION

No corrective action is required from Texas Instruments at this point.

(STEP 6) VERIFY CORRECTIVE ACTION

(STEP 7) PREVENT RECURRENCE

Cc: Sharpe, Robert
Subject: Usage Matrix - Speed Control Deactivation Pressure Switch

Fred,

The following represents a rough usage matrix over time:

MY92	MY93	MY94	MY95	MY96	MY97	MY98
Econoline	Econoline	Econoline	Econoline	Econoline	Econoline	Econoline
Club Wagon	Club Wagon	Club Wagon	Club Wagon	Club Wagon	Club Wagon	Club Wagon
Town Car	Town Car	Town Car	Town Car	Town Car	Town Car	
Crown Vic	Crown Vic	Crown Vic	Crown Vic	Crown Vic	Crown Vic	
Grand Marquis	Grand Marquis	Grand Marquis	Grand Marquis	Grand Marquis	Grand Marquis	
	F Series	F Series	F Series	F Series	F Series	F Series
	Bronco	Bronco	Bronco	Bronco		
	SHO Taurus	SHO Taurus	SHO Taurus??			
		Capri	Capri	Capri??		
		Win95	Win95	Win95	Win95	Win95
			Falcon	Falcon	Falcon	Falcon
				Explorer??	Explorer	Explorer
				Ranger??	Ranger	Ranger
					Expedition	Expedition
						Navigator

To be quite honest, I think we actually have more of a grasp on the application matrix in the MY92 - MY95 timeframe than MY96 on. Where you see ??, this means the actual starting or ending model year for a program may be +/- 1 model year. Also, it is conceivable that as of the MY95 timeframe, we are actually released on more platforms than what is shown above. I say this because our actual shipped volumes which are in the 2MU range, would indicate either 100% penetration for cruise control on all of the platforms listed or we are on more than the listed platforms.

One additional note, during our discussion yesterday, you talked about the switch being hot on the Town Car. I think I misunderstood the context of your statement. At the time of our discussion, I was thinking thermal hot but upon further reflection believe you may have meant wired hot. If this is the case, I am pretty sure the switch is wired hot in virtually all of the above applications. This issue can be discussed further on Tuesday as we will be prepared to provide a brief overview on our understanding of how the switch is electrically plumbed into the system.

Any additional questions, please let me know me at your convenience. Also, if the above application matrix does not come across legible, please let me know and I will have this faxed to your attention.

Regards,

Charlie

12/21 (From C. Douglas)

Fred,

I believe that your list includes some service part numbers, older rev levels, as well as pre-production or prototype part numbers. Overall, including Ford Australia, there are eight different production parts. Differences from part to part are fairly minor and include, actuation calibration, release pressure, hexport style, position tab / color of connector base, thread style, and snap noise associated with the pressure disc. The following matrix, helps summarize this information:

Part Number	Actuation	Release	Base	Hexport	Thread	S or Q
F2VC 9F924 AB	90-160 (1)	20 min	Brown / pos 2	J512	3/8-24M	Snap
F6LC 9F924 AA	200-300 (2)	40 min	Black / pos 1	J512	3/8-24M	Snap
F2AC 9F924 AA	90-160 (3)	20 min	Natural / pos 2	J512	3/8-24M	Quiet
F58A 9F924 AA	90-160 (4)	20 min	Grey / pos 1	J512	3/8-24M	Quiet
F3TA 9F924 CA	200-300 (5)	40 min	Red / pos 1	J512	3/8-24M	Snap
94DA 9F924 AA	90-160 (6)	20 min	Natural / pos 2	o-ring	M10x1.0M	Quiet
F3DC 9F924 AA	90-160 (7)	20 min	Natural / pos 2	Rubber	3/8-24M	Quiet
94JA 9F924 AB	90-160 (8)	20 min	Grey / pos 1	o-ring	3/8-24M	Quiet

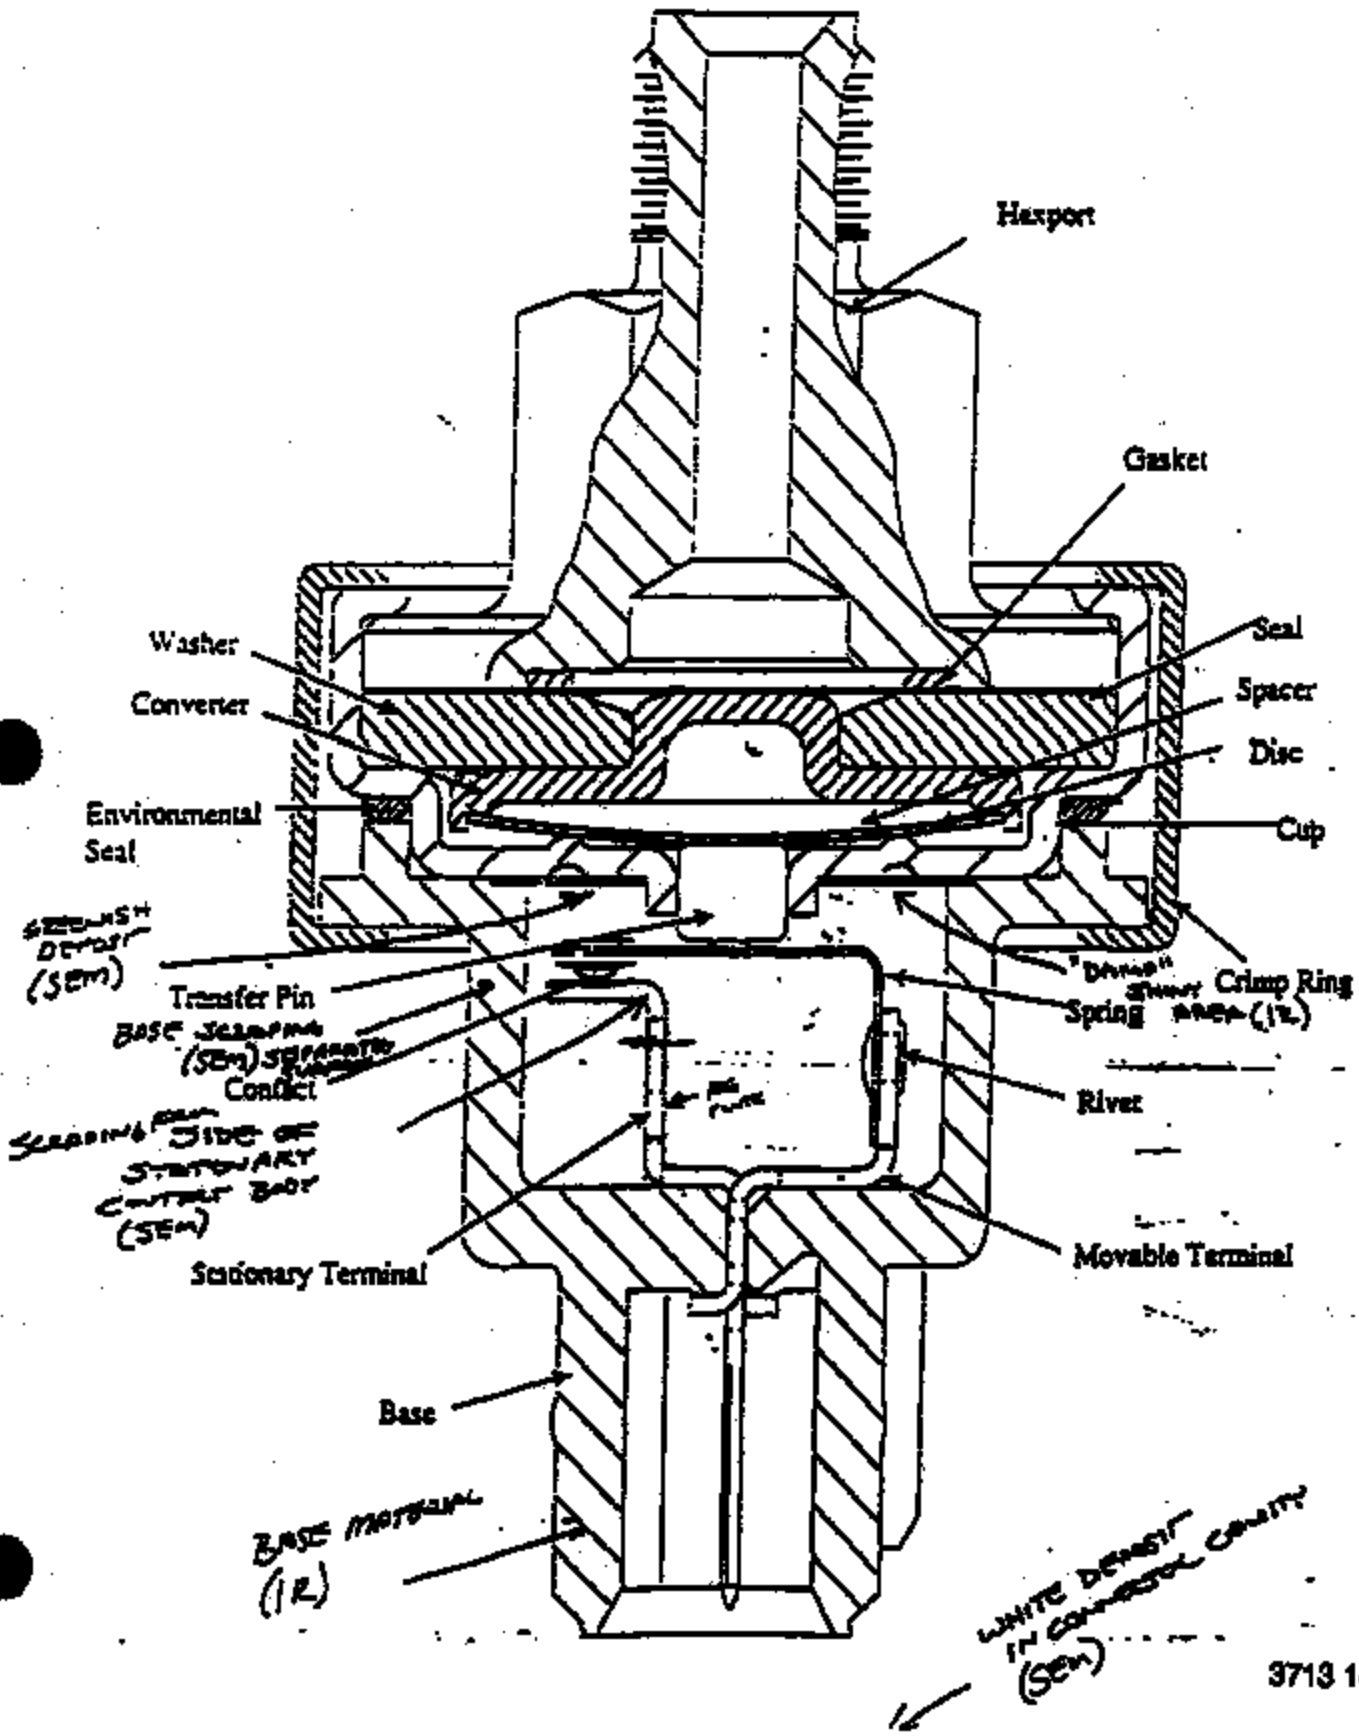
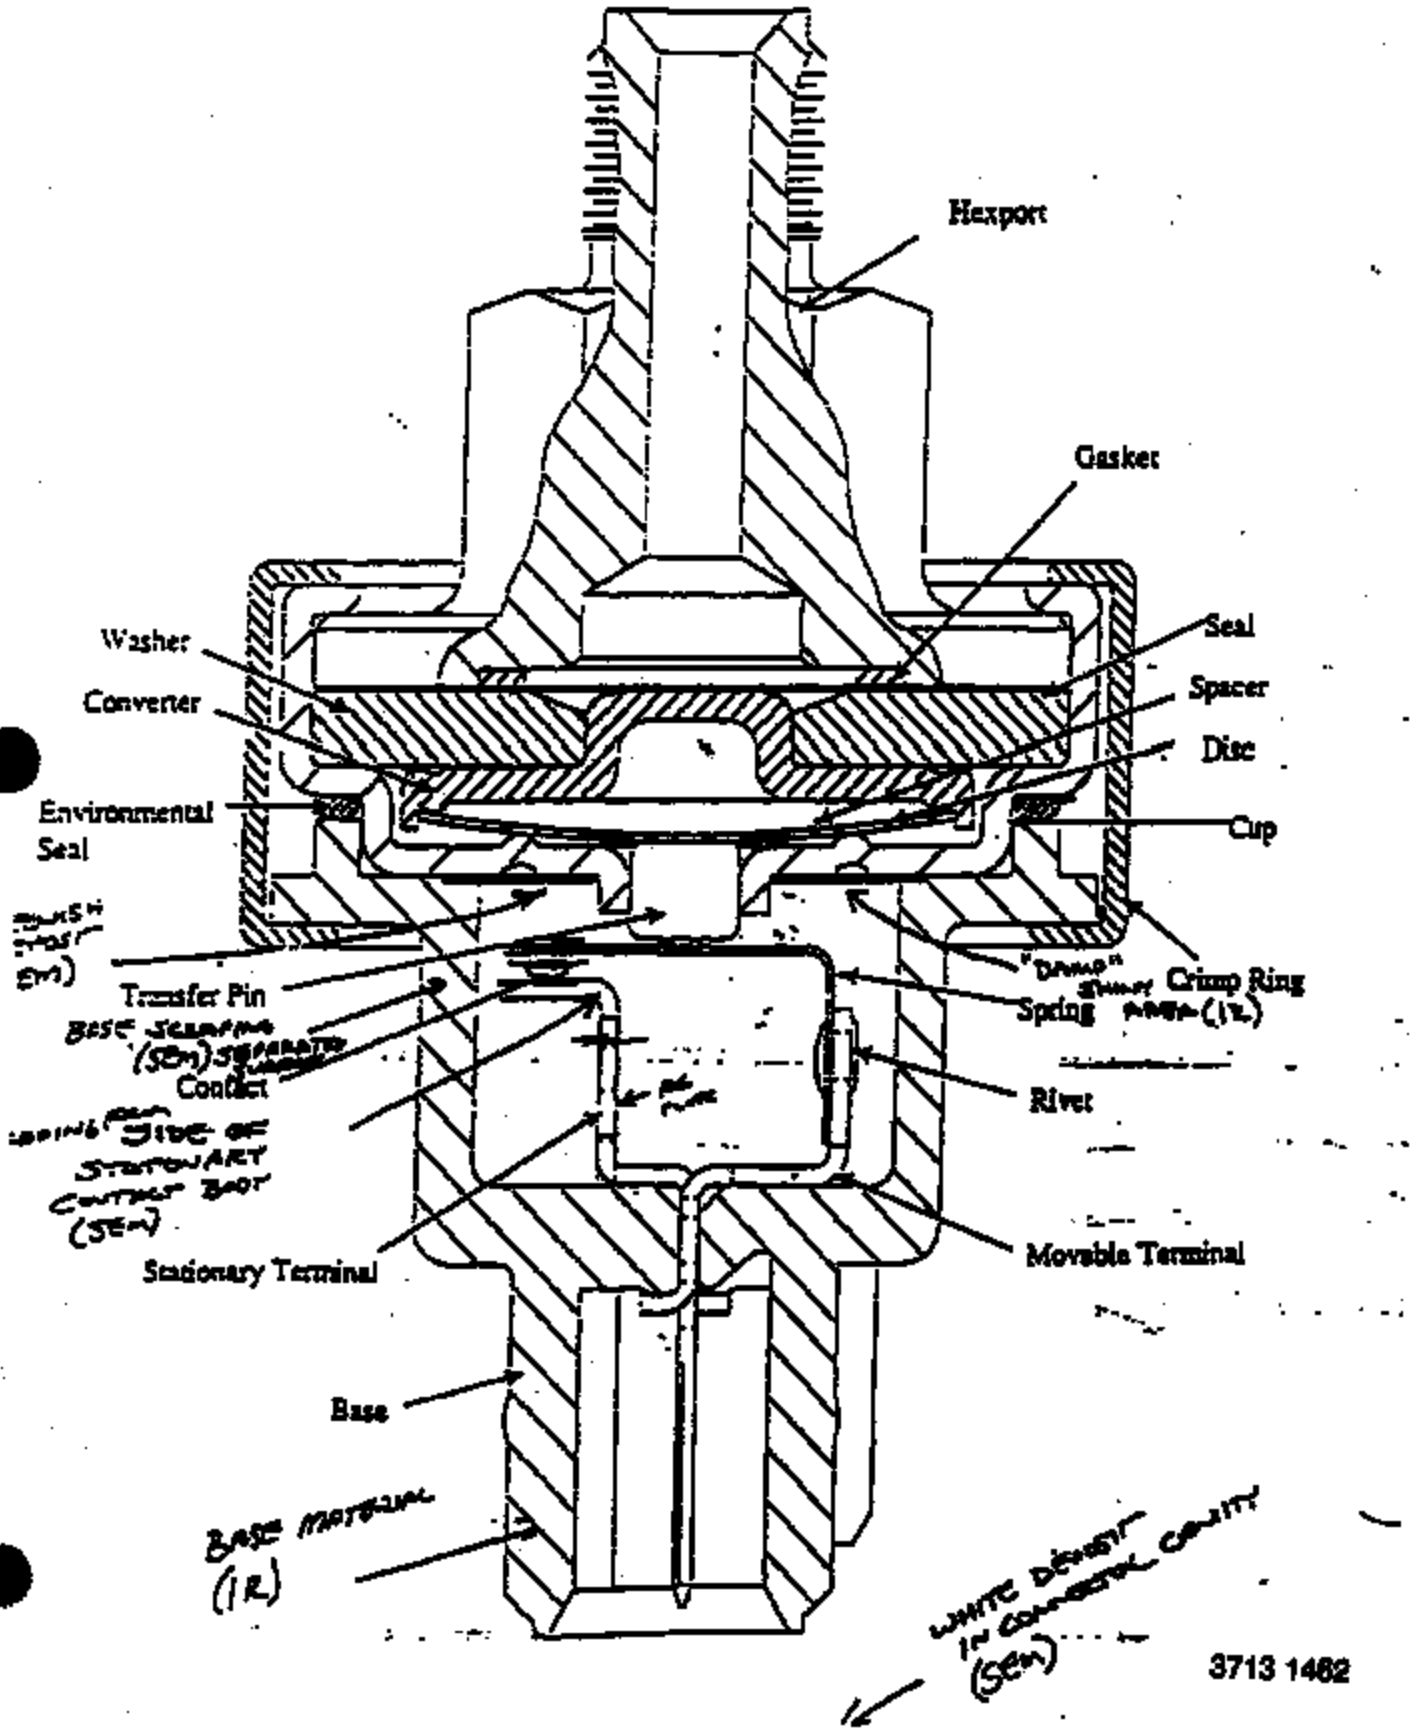
Hydraulic Pressure Switch Cross Section



Hydraulic Pressure Switch Cross Section



Central Laboratory
16000 Century Drive
Dearborn, MI 48120-1267

January 15, 1999

Preliminary Findings:

The cup is partially covered with a greenish residue. Residue appears to be primarily an oxide of the brass contact material with possibly a sulfur compound. This suggests transfer of oxide or corrosion product from the brass contacts to the cup.

The stationary contact exhibits intergranular cracks which indicate stress corrosion cracking (SCC). SCC is caused by combination of a specific corrosive environment and a sustained tensile stress (can be localized). Ammonia, ammonia compounds, sulfur compounds, and moisture are known to cause SCC in brass. The contact material has been reported to be 360 brass, which is highly susceptible to SCC.

The presence of brake fluid on the switch side of the diaphragm has been determined. Black residues in the hex port and on the cup, converter, and disc appear to be compounds which may have formed from a reaction between decomposition products (acids) of the polyester base, the brake fluid, and metals in the switch. This suggests that the brake fluid was present on both sides of the diaphragm during the thermal event.

All three diaphragms exhibit what appears to be mechanical damage. The damage does not match up with any mating parts of the switch. This suggests that damage may have occurred prior to assembly. The diaphragm has become brittle and cracked in the vicinity of the damage. Brake fluid has become entrained between the layers (Teflon and capton) of the diaphragms.

The post of the movable contact melted back into the bulkhead between the switch and terminal cavities of the base. There is also arc damage (localized melting) to one corner of the bridge of the stationary contact. This damage appears fresh (surfaces bright and shiny) which suggests that it may have occurred in the later stages of the thermal event.

The terminals exhibit deposits which appear to be primarily sulfur compounds of the terminal material (tin plated brass). Although these deposits appear visually similar to the deposit found on the cup, they appear to be of different composition.

The white residue found in the connector cavity contains elements found in dry chemical fire extinguishers (Muscovite and phosphorus)

COMMENTS

--TYPE--	COMMENT TEXT
CONCER	INITIALLY THE CUSTOMERS CONCERN WAS THAT THE VEHICLE WOULD NOT COME OUT OF PARK. WHILE IN THE DEALERSHIP, AN UNDERHOOD FIRE STARTED, CAUSED BY A LEAKING BRAKE FLUID THROUGH THE SWITCH INTO THE CONNECTOR.
REPAIR	REPLACED THE SPEED CONTROL SWITCH AND CONNECTOR. REPLACED THE STOP LAMP SWITCH FOR THE ORIGINAL CUSTOMERS CONCERN. PER TECHNICIAN, THIS IS THE THIRD UNIT THAT HAD AN UNDERHOOD FIRE THAT APPEARED TO ORIGINATE FROM THIS AREA. THE OTHER TWO WERE TOO DAMAGED TO DETERMINE THE SPECIFIC LOCATION OF THE POINT OF THE ORIGIN. THE SWITCH AND CONNECTOR ARE PRESENTLY IN MY POSSESSION IN THE MEMPHIS REGIONAL OFFICE.

Engineering Specification

SWITCH ASSEMBLY - SPEED CONTROL, DEACTIVATE

I. General

This specification covers the test requirements for the speed control deactivate switch -XXXX- used in the electronic speed control system. Design changes on the switch assembly or its components shall not be made without compliance to Section V of this specification and written approval from the releasing Production Engineering Office.

This engineering specification is a supplement to the released drawing on the above part, and all requirements herein must be met in addition to all other requirements of the part drawing. Minimum measures necessary for demonstrating compliance to these requirements are given in each section.

The engineering tests, sample sizes, and test frequencies contained within this engineering specification reflect the minimum requirements established to provide a regular evaluation of conformance to design intent. The engineering test program is intended as a supplement to normal material inspections, dimensional checking and in-process controls, and should in no way adversely influence other inspection operations.

QS suppliers may implement different test sample sizes and frequencies providing these changes have been included in an alternate Control Plan approved by the design responsible Product Engineering Office and concurred in by SQA.

II. PRODUCTION VALIDATION AND IN-PROCESS TESTS

- Production Validation (PV) Tests must be completed satisfactorily with parts from production tooling (and processes where possible) before ISIR approval and authorization for shipment of production parts can be effected. Parts must be revalidated completely, or per Section V whenever any change is made which could possibly affect part function or performance.

- In-Process Test Phase 1 (IP-1) - IP-1 tests are used to demonstrate process capability and must be completed using initial production parts from production tooling and processes prior to first production shipment approval. IP-1 tests are to continue in effect until process capability is demonstrated.

- In-Process Tests Phase 2 (IP-2) - IP-2 test program may be implemented only after process capability has been established. Tests must be completed with production parts on a continuing basis. Samples for these tests must be selected on a random basis to represent the entire production population as much as possible. In the event that any of the requirements in these tests is not met, the reaction plan specified in Ford Q101 Sect. 3.9, "Engineering Specification (ES) Test Performance Requirements" shall be invoked.

III. TEST REQUIREMENTS AND PROCEDURES

▽ A. Calibration

1. Test Requirements

a. Switch calibration is to be checked at room temperature (15°C-35°C) using ambient air or equivalent.

b. Calibration settings shall be specified on the part drawing with the settings checked after 2 or more pressure cycles with ambient air, or equivalent. Pressure cycle range is to be determined by the manufacturer to insure switch calibration stability. The cut-in and differential set points are to be measured while conducting 750 ± 50 milliamperes while 13.0 ± 1.0 volts D.C. is applied. The cut-in point is to be checked with increasing pressure.

c. The cut-out point is to be checked with decreasing pressure, and the differential set point is to be calculated using the cut-in pressure minus the cut-out pressure.

2. Acceptance Requirements

a. Nonconformance is defined as any switch point which falls outside the tolerance band specified on the part drawing.

B. Voltage Drop

1. Test Requirements

a. Voltage drop is to be measured after 2 or more cycles with ambient air or equivalent from 0 to 10,000 ± 172 KPa (1450 ± 25 PSI) while conducting 750 ± 50 milliamps and 13.0 ± 1.0 volts D.C. is applied to the switch. Under these conditions with the switch closed the voltage drop is to be measured. Millivolt connection interfaces at terminals to be less than 10 millivolts.

2. Acceptance Requirements

a. Nonconformance is defined as a voltage drop in excess of 200 millivolts.

III. TEST PROCEDURES AND REQUIREMENTS (cont'd)

C. Current Leakage

1. Test Requirements

a. Current leakage is to be checked with 500 volts, 60 Hz alternating current.

b. Current leakage is to be checked:

(1) Between the switch leads with the contacts open.
(2) Between the lead and the switch housing with contacts closed.
(3) Between either lead and switch housing with the contacts open.

2. Acceptance Requirements

a. Nonconformance is defined as any leakage current in excess of one hundred (100) microamperes.

D. Proof Test

1. Test Requirements

a. Subject sample switches to Section A to establish their initial switching pressures.

b. Proof test is to be conducted using brake fluid or equivalent as the pressure medium. Test procedure shall be as specified on the part drawing. Test pressure shall be isolated from pressure source and held for not less than 30 seconds.

c. Recheck the switches to Section A.

2. Acceptance Requirements

a. No evidence of fluid leakage, seepage, or drop in test pressure greater than 430 KPa.(62 PSI) is permitted.

b. A change in cut-in and cut-out pressures greater than ± 5% from the initial value is not permitted.

c. The test samples must be destroyed after testing.

III. TEST REQUIREMENTS AND REQUIREMENTS (cont'd)

E. Impulse

1. Test Requirements

a. Test the switch for a total of 500,000 cycles. Cycle pressure between (low) 0-276 KPa (0-40 psi) and (high) 10,000 ± 345 KPa (1450 ± 50 psi).

1) 0 - 475,00 cycles: 13 ± 1 volts, cross current to monitor function.

2) 475,001 - 500,000 cycles: 13 ± 1 volts D.C., 750 ± 50 ma., per figure 4.

b. Brake fluid temperature to be 135 ± 14°C and ambient temperature to be 107°C min.

c. Cycle rate is to be 110-130 cycles per minute.

d. Switch must open and close each cycle.

2. Acceptance Requirements

a. After impulse test check to sections A, B, C, & D using the procedure established in each section.

b. Nonconformance is defined as any switch not meeting the criteria in sections A, B, C, & D.

c. Samples used for this test must be destroyed after all testing is completed.

F. Burst

1. Test Requirement

a. Burst strength is to be checked using brake fluid or equivalent as the pressure medium.

b. Pressurize the switch to 48.3 MPa (7000 PSI) minimum and hold for 30 seconds minimum.

2. Acceptance Requirements

a. Nonconformance is defined as any evidence of fluid leakage or seepage from the switch or threads. Samples used for this test must be destroyed after testing is completed.

G. Humidity

1. Test Requirements

a. Mount the switch in the test port in a humidity chamber. Currently released mating electrical connector must be installed before start of test.

b. Subject the switch to ten (10) continuous humidity cycles as follows:

(1) Raise temperature to 65 +10/-2 °C over 2.5 hours; at 90-98% relative humidity.

(2) Hold 3 hours at 65 +10/-2 °C at 90-98% relative humidity.

(3) Lower temperature to 25 +10/-2 °C over 2.5 hours; at 80-98% relative humidity.

2. Acceptance Requirements

a. Within 15 minutes after completion of the tenth humidity cycle check the switch to sections A, B, C, D, using the procedure established in each section.

b. Nonconformance is defined as any switch not meeting the criteria in sections A, B, C, or D.

H. Salt Spray

1. Test Requirements

a. Mount the switch in the test port in a salt spray chamber. The currently released mating electrical connector and wiring must be installed prior to start of test.

b. Expose the switch assembly to 72 hours of salt spray per ASTM B-117.

2. Acceptance Requirements

a. After exposure, check the switch to sections A, B, C, D, using the procedure established in each section.

b. Nonconformance is defined as any switch not meeting the criteria in sections A, B, C, or D. Samples used for this test must be destroyed after all testing is completed.

III. [illegible] (cont'd)

I. Vibration

1. Test Requirements

a. Mount the switch in the test port and attach the customary delivered mating electrical connector before start of test.

b. Switches are to be vibrated in all 3 planes with electrical continuity being monitored during the entire test. See Figure 1 for switch orientation in the 3 planes. Vibration tests are to be conducted at room temperature using brake fluid, ambient air, or equivalent as the pressure medium.

c. Internal pressure shall be maintained at 0 KPa G. when the switch is in the closed position and 1.1 times max actuation pressure shown on print when the switch is in the open position.

d. Vibrate the switch at 1.5 cm displacement (peak-to-peak) while varying the frequency uniformly from 9 to 50 to 9 Hz over a 3 minute period.

e. Vibrate the switch in alternate one-hour periods in the open and closed positions for a total of 8 hours in each plane. (Total test time is 24 hours).

2. Acceptance Requirements

a. After the entire vibration sequence check the switches to sections A, B, C, or D using the procedure established in each section.

b. Nonconformance is defined as any evidence of leakage or any change in electrical continuity/discontinuity during the vibration cycle, or any switch not meeting the criteria in sections A, B, C, or D. Samples used for this test must be destroyed after all testing is completed.

3713 1516

III. [illegible] (cont'd)

J. Terminal Strength

1. Test Requirements

a. Mount the switch in the test port.

(1) Apply a 88 ± 9 N axial force to each terminal.

(2) With a pendulum apply a 45 ± 5 N impact force to the switch housing at the connector end, perpendicular to the connecting axis of the switch. See Figure 2 for force application point and direction.

2. Acceptance Requirements

a. Check the switch to sections A, B, C, and D using the procedures established in each section.

b. Nonconformance is defined as any terminal or housing fracture, or any switch not meeting the criteria in sections A, B, C, or D.

K. Vacuum

1. Test Requirements

a. Mount the switch in the test port. Vacuum tests are to be conducted at room temperature using ambient air as the pressure medium.

b. Subject the switch to 5 cycles of vacuum from atmospheric pressure (760 mm Hg) to an absolute pressure of 3-4 mm Hg. Maintain the vacuum for a minimum of 60 seconds.

2. Acceptance Requirements

a. Check the switch to sections A, B, C, and D using the procedure established in each section.

b. Nonconformance is defined as any switch not meeting the criteria in sections A, B, C, and D.

III. TEST PROCEDURES AND REQUIREMENTS (cont'd)

L. Temperature Cycle

1. Test Requirements

a. Mount switches in test ports; test to be run using currently released brake fluid.

b. Repeat the following procedure 25 times.

(1) Lower the switch and fluid temperature to at least -40°C.

(2) Cycle the switches ten times at 10 seconds/cycles. One cycle consists of a pressure variation from 0 - 276 KPa.G (0-40 psi) to 10,000 ± 345 KPa.G (1450 ± 50 PSI). Note: Switch must open and close each cycle.

(3) Raise switch and fluid temperature to 38°C minimum.

(4) Repeat Step 2.

c. At completion of Step b, check switches per sections A, B, C, and D.

2. Acceptance Requirements

a. Nonconformance is defined as any evidence of switch fluid leakage, seepage, or not passing the criteria of sections A, B, C, and D.

M. Fluid Resistance

1. Test Requirements

a. Mount the switch in the test port and orient as installed in the vehicle.

b. Install the currently released mating electrical connector (with wire leads) to the switch.

c. Sequentially, immerse the switch into each of the specified fluids, at a temperature of 23 ± 2 °C, for 5 ± 1 second. Remove the switch and drain and store the switch for the specified time at room temperature, prior to immersing into the next fluid.

3713 1518

III. TEST SEQUENCES AND REQUIREMENTS (cont'd)

Fluid	Drain Time	Storage Time
Reference Fuel C ASTM D471	60 ± 5 min.	none
10W40 Engine Oil	24 ± 1 hour	14 days
Ethylene Glycol/ Water 50/50 by Volume	24 ± 1 hour	24 ± 1 hour
Brake Fluid DOT 3	24 ± 1 hour	48 ± 1 hour
Automatic Transmission/ Power Steering Fluid (name) XSP-M2C138-CJ	24 ± 1 hour	14 days
Isopropyl Alcohol/ Water 50/50 by Volume	24 ± 1 hour	none
Reference Fuel C, ASTM D471 with Methyl Alcohol 85/15 by Volume	24 ± 1 hour	none

4. Per the Flow Chart, subject the prescribed number of immersed switches to the post immersion tests specified below:

   III. E. Impulse
   III. G. Humidity
   III. H. Salt Spray
   III. J. Terminal Strength

Acceptance Requirements

a. Switches must fully meet the requirements of the specified post immersion test.

b. Nonconformance is defined as any switch not meeting the criteria in sections A, B, C, or D. Samples used for this test may be destroyed after all testing is completed.

IV. [illegible]

A. For PV, IP-1 and IP-2 tests, all samples tested must pass. Having all the required sample size pass will provide data to support the conclusion that the switch has a minimum reliability R, at a given confidence of C. The notation Pa-R is interpreted as minimum reliability equal to R, at a confidence C; thus P90-.80 means a minimum reliability of 80% at 90% confidence.

B. All samples must pass in the statistical test acceptance criteria stated for tests with 100% frequency; or samples from lots; which could have a variable size.

V. [illegible]

A. No change in design, material, process or component supplier shall be made without prior approval from the releasing Product Engineering Office. As part of approving a change, the releasing Product Engineering Office will establish the portion of the Product Validation tests required to be run to revalidate the switch. The following table is to be used as a guide in determining the type of tests required for revalidation requirements.

[illegible]

Component	Process or Material Change or New Supplier
1. Terminals, Contacts, or Contactor	III, B, C, E, G, H, I, J, L, M.
2. Case or Housing	All Tests
3. Disc or Diaphragm	III, A, D, E, F, I, K, L
4. Fitting or Fluid Connection	III, D, E, F, H, I, M.

B. Annual revalidation is not required on carryover switches.

VI. [illegible]

A lot is defined as no more than eight (8) hours of production up to 4,000 pieces. If shifts extend beyond eight (8) hours, or more than 4,000 pieces are produced in a shift, the product must be separated into at least two lots.

VII. [redacted]

A. Recording and record retention shall conform with Ford Q-101.

B. Production Validation test results and analysis are to be forwarded to the releasing Product Engineering Office before approval for shipment of production parts can be granted.

C. In-Process test results shall be available at the supplier's manufacturing facility for the releasing Product Engineering Office and Ford SQA or its representatives to review on request.

VIII. [redacted]

All switches are to be identified with the Ford part number, supplier identification, and a date code indicating final assembly.

All test equipment and test procedures for testing to this specification must be approved by the releasing Product Engineering Office and no change in equipment or procedure may be made without their written concurrence.

Test port configuration is shown in Figure 5.

O-rings, if used in the design, shall be free from cuts, nicks, abrasions or any other damage which would result in a fluid leak.

All switches must have a shipping cap installed over the port threads to prevent contamination. All shipping caps must be approved by the releasing Product Engineering Office prior to production interpretation.

All switches that do not pass the calibration test are to either be readjusted and rechecked, or scrapped. (Salvage of component parts permitted with 100% reinspection).

If product nonconformance occurs for test Sections III. B, C, D, E, F, and J, production shall be stopped and the problem corrected. All production lots shall be sorted 100% prior to shipment. Suspected nonconformance of any shipped parts shall be reported immediately to the releasing Product Engineering Office.

If nonconformance of the statistical acceptance criteria occurs for test Sections III. G, H, I, K, L and M, a cause to recall the subject weeks production and to stop production may result.

Switch current ? — Speed control deactivat switch

Brake fluid ignition?

Are Service Parts Involved ?

Was cruise control standard in Town Car

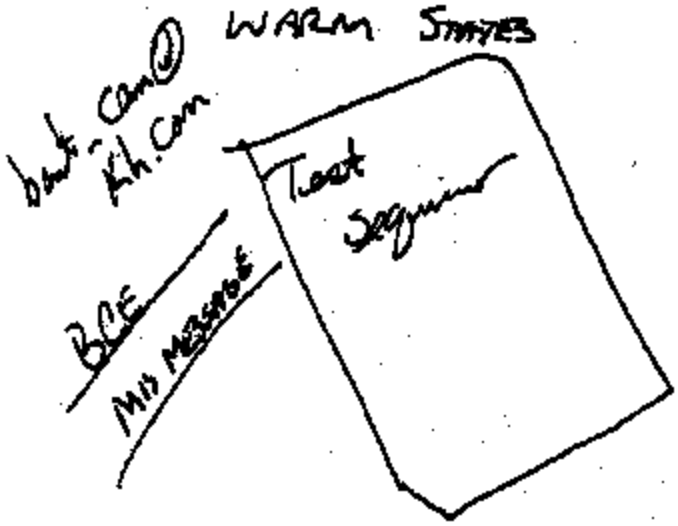
Repairs are ambiguous

Is speed control standard / optional on CVGM

Contact for future NHTSA MEETINGS

CARS ON ROAD

WARM STATES



92 Town Car Mtg - brake issues discussed
Jim Lindgren & TOM MASTERS
Joe Quasny
Mike Fodera
Fred Porter
3 GEN
→ Planned on brake training in EVTM
Brake Warning Switch called Speed Control Deactivation Switch
Locate in PER Tb prop Tahoe
Supplier = Sunfaces

QUESTIONS
- Is brake fluid Hygroscopic — brake pressure switch
- will brake fluid explode if brake light at all times and overheated?
- Is Speed control ETD on Town Car
- How similar is Town Car + Sable per quoted P/N, packaging, etc
- Does Town Car VIN's with infinity issue bad passive service repair.
- Need single point contact for chassis brake switch.
- Why is this part 92 only

IS SPEED CONTROL SWITCH HOT ON ALL VEHICLES

92 Town Car Mfg – brake pressure switch
Dim Endgame of TOM MASTERS
Joe Quigg
Mike Fodera
Fred Porter
SEEN
→ Plowed on Bright Evening for EVTM
Brake Warning buckof called Speed Control Deactivation switch
Combo in PER for prop failed
Supplies = Surfacer

QUESTIONS
- Is brake fluid flammable
- will brake fluid splatter if combo hot at all times brake pressure switch and interconnections

- Is Speed control STD on Town Car
- Need circuits in Town Car + Sable for switch P/N, packaging, etc.

- Does Town Car VIN with safety issues had previous service repairs.
- Need single point contact for chassis brake switch.
- Why is this part 92 only

IS SPEED CONTROL SWITCH HOT ON ALL VEHICLES

	Clark Thomas	x59-41313	cthomas5
	Greg Stevens	x32-36686	gstaven1

INFORMATION:

NHTSA letter: PE98-055

Vehicles identified: 21 initially identified.
20 additional vehicles reported since publication of the investigation.

Warranty: A total of 89 warranty claims are identified in AWS on the F2VY-9F924-A for 1992 and 1993 Town Cars.

Two CQIS reports [redacted] mention underhood fire

in connection with the brake pressure switch.
NJTAA135 occurred at 51,500 miles.
VDUAA322 occurred at 56,802 miles.

Supplier: The pressure switch was manufactured by Texas Instruments. The switch was purchased in assembly with the brake proportioning valve bought from Surfaces.

Contacts: Surfaces - Mike Thomas (248)543-6520 [HILITE Industries]
TI - Andy McGuirk (508)236-3080.

Function: The brake pressure switch is a redundant switch for turning off the speed control function.

ON-GOING ACTIVITY:

Norm LaPointe and Clark Thomas will meet with engineers from Central Laboratory to X-ray one part on 12/17/1998.

QUESTIONS: (in no particular order)

1) What is the normal current in the brake pressure switch?

2) Was cruise control standard on Town Car in 1992 and 1993?

3) Under what circumstances is brake fluid flammable?

4) What is the repair history for vehicles that have exhibited a problem?

5) What other vehicles use this brake pressure switch? What are their electrical configurations?

6) Is this switch still in use? If not, why not? If so, what design changes have been implemented since 1992/1993?

7) What fault codes are stored if the brake pressure switch fails?
