Notes: Scott, in the January 2006 Consumer Reports magazine, , page 11, which features Recalls & Safety Alerts, under the heading of Vehicles and Equipment, there is an item which is clearly relevant to the ongoing investigation. The item concerns 04-05 Toyota Prius autos. "'Logic"' problem in electronic -control module could cause various warning lights to come on, gasoline engine to shut down, and electric motor to operate at diminished power." There is additional information in that alert which I am certain is available to you. It is further proof of the continuing problems with the ECM modules in Toyota and Lexus vehicles which cause numerous and unending problems, including in particular the Toyota and Lexus vehicles accelerating totally out of control because of defects in the ECM modules. It is about time someone does something about these dangerous

shortcomings in these vehicles, as I have demonstrated in the materials previously sent you and clearly demonstrated by my own experience.

Jordan
