1. Issue Description

Customer Complaint: Check Engine Light On
DTC Codes: (2) P0504 – Brake Switch "A"/"B" Correlation, (1) C1513 – Brake Switch Error, (1) Will not shift out of "P" Park

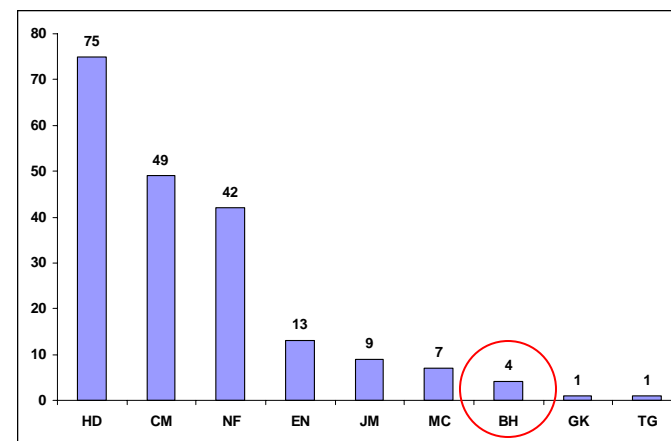

2. Part Analysis

Corrosion on the main contact point.
Unknown source

3. Data Analysis

Conclusions: 93810 – All models with a brake switch issue from Jan, 2008 to present

4. HMA Request

- Production C/M: None
- Port action: None – looking at average mileages – this issue take time to develop.
- Field fix: Request a field fix TSB for this issue if a countermeasure is available.
- TSB: None at this time
- C/M Part: Please provide a new p/n when issuing a C/M
- Other comment: None

[B] STOP LAMP SWITCH INTERMITTENTLY MALFUNCTIONING (EARLY WARNING) - HMMA				

1. Condition:

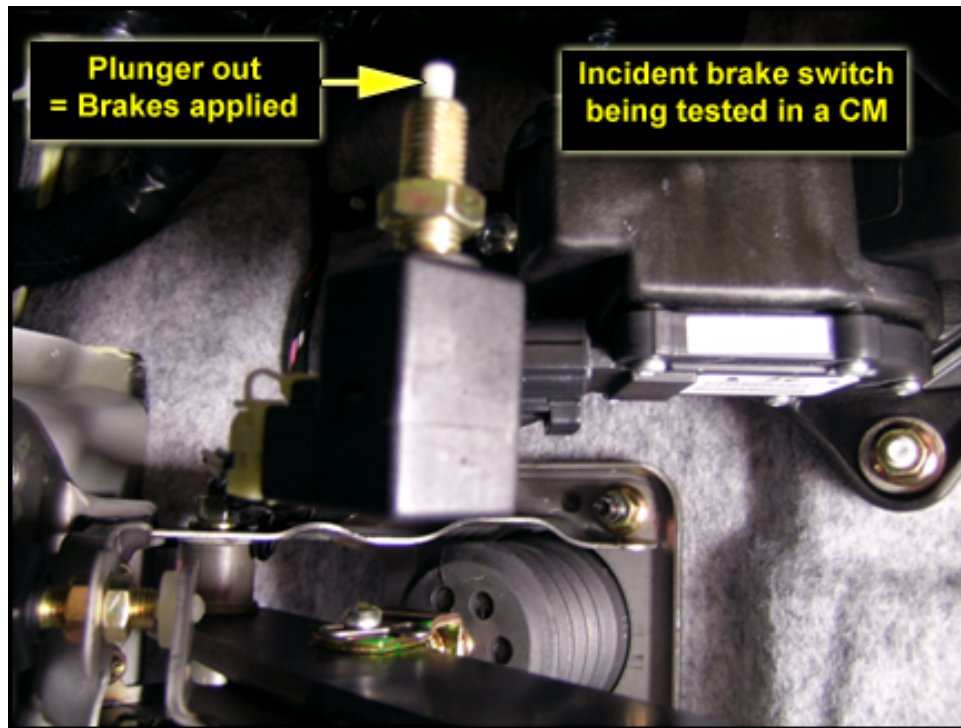

- The ESC light is ON.

2. Analysis:

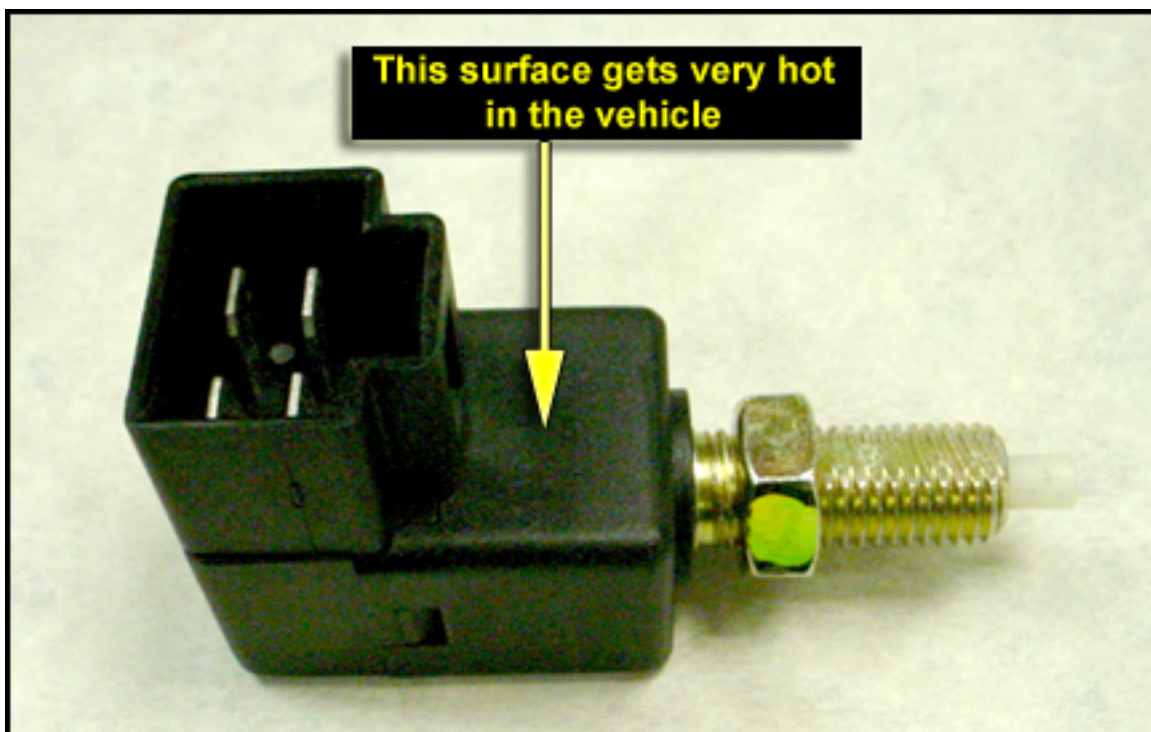

- The dealer technician confirmed the condition.
- The High Scan retrieved DTC C1513 (Brake Switch Error).
- Replacing the stop lamp switch, P/N: 93810-3K000, corrected the condition.
- The incident switch was sent to HMA for analysis.
- The incident switch was checked statically on the bench with a multi meter.
- The brake switch checked OK as shown.

- The stop lamp switch was then installed in the vehicle as shown and operated with fingers simulating brake application.

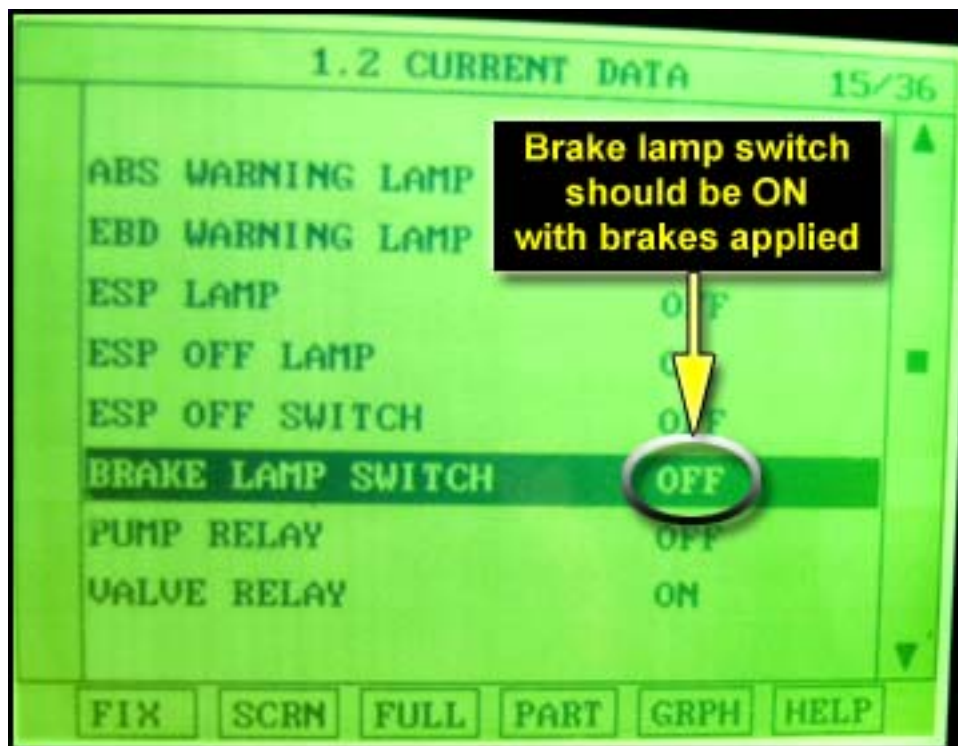

- Under voltage load, the switch got very hot on the switch surface as shown.

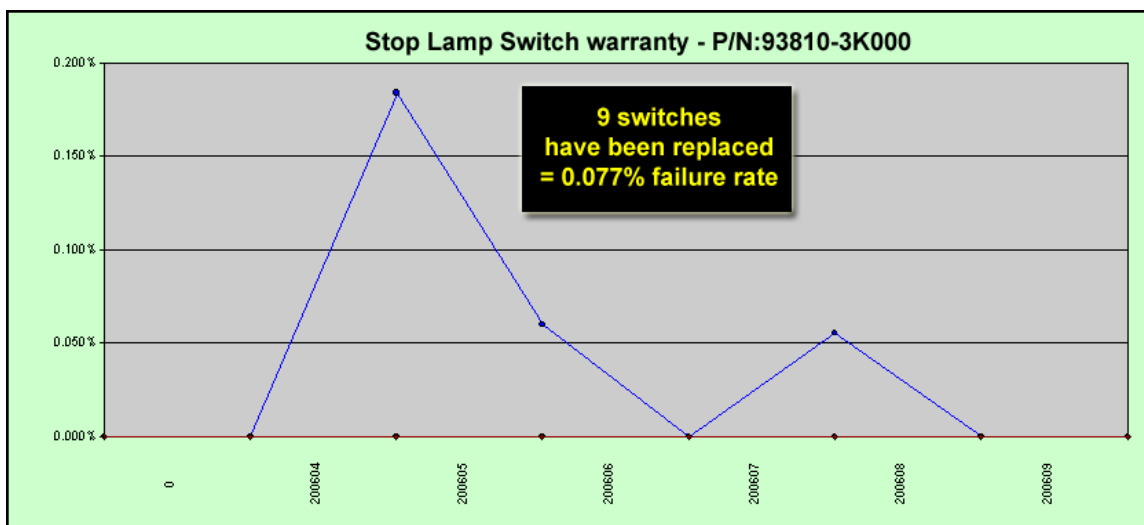

- Also the rear lamps would not turn ON intermittently with the brakes applied condition (switch plunger out) as shown.

- The switch status data was monitored with the High-Scan that also showed switch in the OFF position with the plunger out condition.

- To confirm this condition, the voltage levels were measure between the stop lamp switch terminals 1&2 and 3&4 with a voltmeter which measured to be zero volts.
- The water fall chart provides the following information.

- The TABLE below shows all affected VINs.
Note: The incident vehicle was repaired again at 146 miles.

VIN Number	Prod Date	Mileage	Total Cost
5NMSH13E67H0	2006-05-20	1315	\$48.80
5NMSH13E77H0	2006-05-31	3295	\$169.70

5NMSG13D77H0	2006-05-22	3298	\$32.60
5NMSH13E97H0	2006-05-25	21	\$169.70
5NMSG13D97H0	2006-06-26	28	\$32.90
			\$665.40

- The cause of the switch continuity problem under heat is not known; however, switch plate distortion and/or the plunger sticking under heat are some possibilities.

3. Action:

- Replace stop lamp switch, P/N: 93810-3K000.

4. Comment/Recommendation:

- HMMA should test the incident stop lamp switches sent with this report to confirm switch continuity problem under electrical load or test the switches to determine the root cause of the switch malfunction and apply corrections as necessary.

[B] STOP LAMP SWITCH IN-OPERATIVE (EARLY WARNING) - HMMA				

1. Condition:

The customer complained that the brake light stays ON.

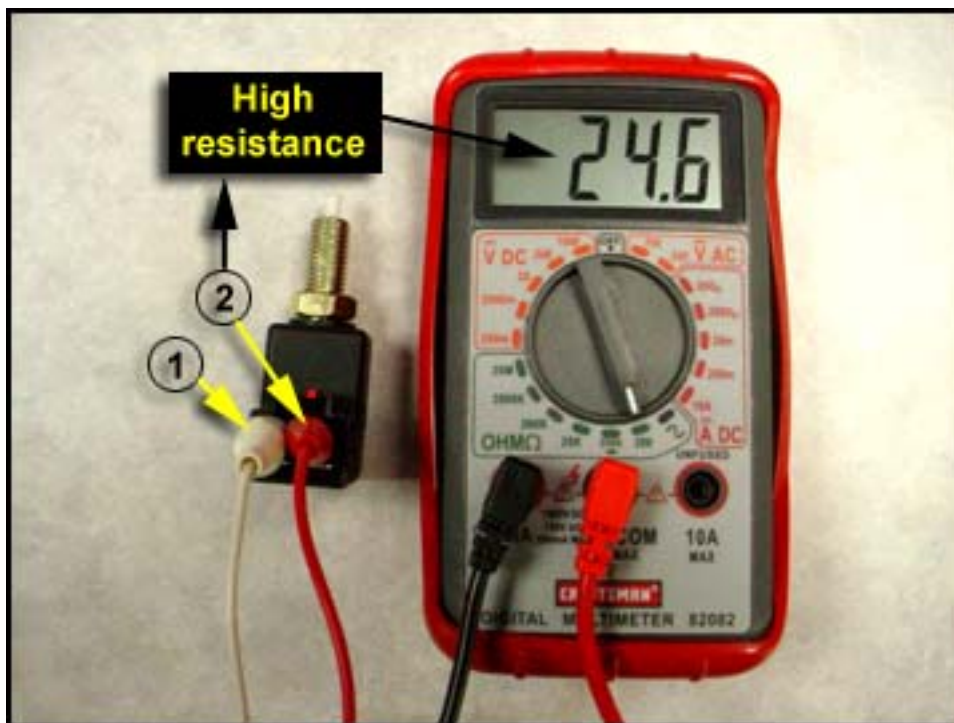

2. Analysis:

- The dealer technician confirmed the condition.
- The rear stop lamps stayed ON after the brake was released and the ignition was turned OFF.
- The Hi-Scan Pro retrieved the DTC P0504 (Brake switch – A/B correlation).
- Replacing the stop lamp switch, P/N: 93810-3K000, corrected the condition.
- The incident part was sent to HMA for analysis.
- The photo below shows the incident switch and the continuity check results.
- Accordingly, the stop lamp switch was determined to be OK (static condition).

- The switch was then installed in a Santa Fe vehicle.
- The customer's condition was duplicated.
- Apparently under voltage and resistive loads, the switch got hot and the contact plate distorted enough to complete the circuit.
- The switch was removed and the resistance was measured as shown below.

Note: The resistance between the terminals 1 & 2 being close to zero Ohm, it was measured high as shown.

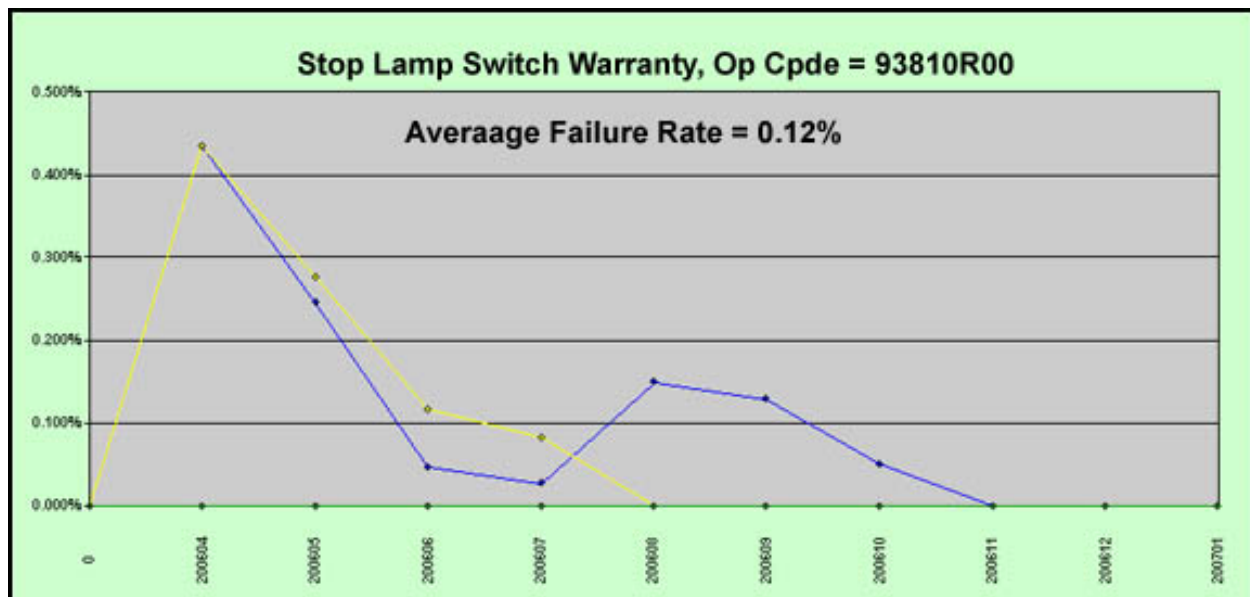

- When the stop lamp switch was in-operative, the temperature of the switch at the RED dot (shown in the photo above) was measured around 135 degrees F.
- The TABLE below provides stop lamp warranty information.

1. Condition:

- Customer statement:

- ESC light has been coming on
- ESC and the check engine lights on and the cruise control does not work.
- Customer states check engine light on
- Can not put car in park, brake lights inop
- ESC light on brake lights not working

- Technician statement:

- P0504. Tech replaced faulted /shorted brake light switch and verified repair
- Replaced brake switch because it kept coming out of adjustment
- ABS, brake and air bag light is on, code C1513, short in stop switch, replaced stop switch
- Scan found code C1513. Then found that brake lamp switch has an internal open.

- Customer driving habit / operation condition: N/A

- Road condition: N/A

- Weather condition: N/A

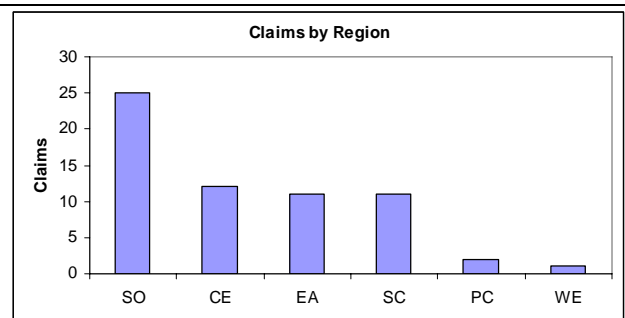

- Vehicle speed: N/A

- Number of passengers: N/A

Subject	(QACM-C-070108) [B] STOP LAMP SWITCH IN-OPERATIVE (EARLY WARNING) - HMMA		
Report No.	B28MM2007011053	Model	Santafe(CM)
Status	Improved	TSB No.	NULL
Attachment			
► Improvement Status			
Condition	The customer complained that the brake light stays on.		
Cause	Brake light switch is overheating , causing the brake light to remain on.		
Countermeasure	EO change was not approved by HMC. Containment at supplier is a 100% check for a set cycle to confirm functionality of the switch. Yellow dot is marked after passing test.		
	VIN 5NMSG13D17H[REDACTED] Date 2006.12.15		
Effective Date		Vehicle ID Number	5NMSG13D97H[REDACTED]

HMMA Presentation:

Quality Issue: Brake Lamp Switch Inop		Resp. Dept.: QA
		Presenter: Dan Mueller
Problem (Photo / Diagram)	Before (Photo / Diagram)	After (Photo/Diagram)
Brake Lamps do not illuminate when brake switch is activated.		
Status and Cause	Countermeasure Description	Service Countermeasure
Switch overheating causing warping and contacts do not close.	H0W60167 redesigns switch to improve heat resistance. 15 Dec 06 implementation at HMMA for automatic transmissions. Manual transmission anticipated implementation of April 2007. EMF 269532, CRA 061360	Replace switch
	Service Compatibility Yes / No	Supplier GLOVIS
	P/No. Change Yes No	Original Resp. Dept.

Failure Parts Analysis:

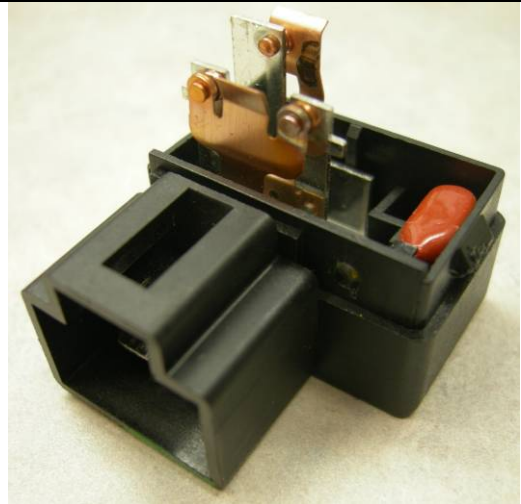

Picture 1

- "New" countermeasure part
- VIN: 5NMSH13EX7H[REDACTED]
- P/D: 3/26/07
- Miles: 5,660

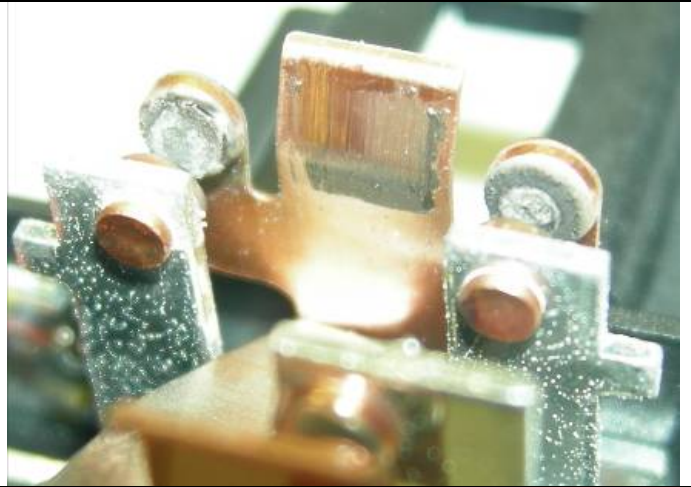

Picture 2

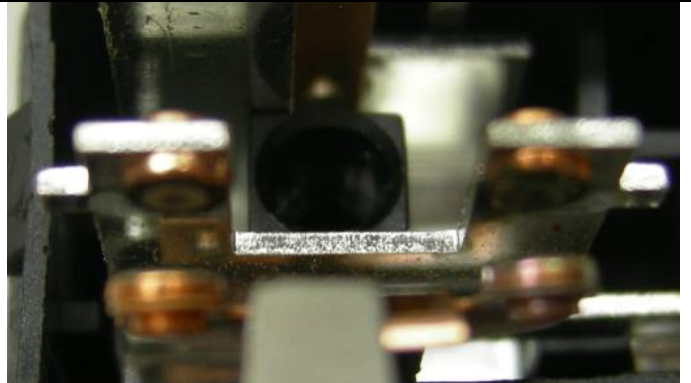

- Picture of the switch mechanicals
- Note the 2 individual circuits and the capacitor
- VIN: 5NMSH13EX7H [REDACTED]
- P/D: 3/26/07
- Miles: 5,660

**Picture 3**

- Most of the silver coating from the stationary side of the circuit has transferred to the opposite terminal
- Without the coating this is a poor conductor
- VIN: 5NMSH13EX7H [REDACTED]
- P/D: 3/26/07
- Miles: 5,660

**Picture 4**

- Picture of the stationary side of the circuit. Note that the silver material is no longer present
- VIN: 5NMSH13EX7H [REDACTED]
- P/D: 3/26/07
- Miles: 5,660

**Picture 4**

- Stop Lamp Switch imprinted information.
- VIN: 5NMSH13EX7H [REDACTED]
- P/D: 3/26/07
- Miles: 5,660

Warranty Analysis:

Op Code: 93810R00

Prod Dates: 200701 – 200710

62 Claims

Total Cost: \$2,269.51

Causal Part #: 93810-0W000

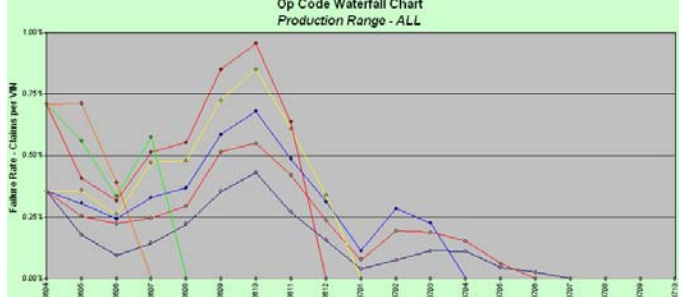

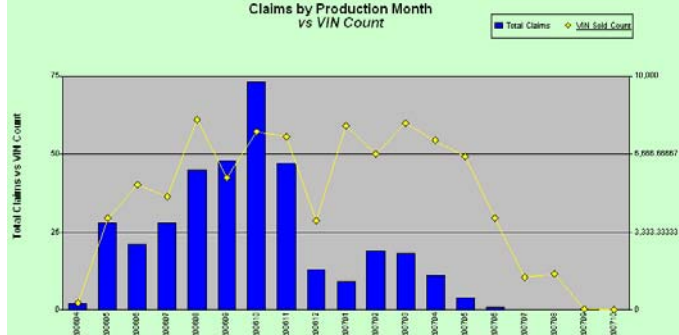

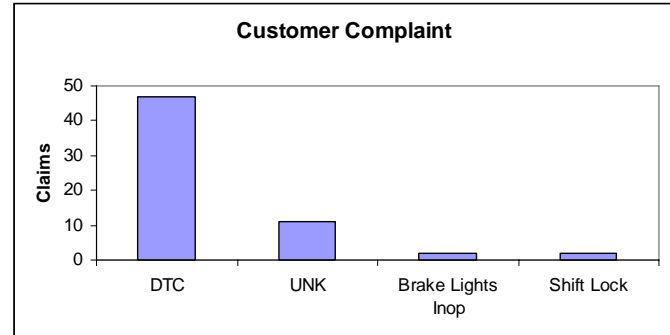

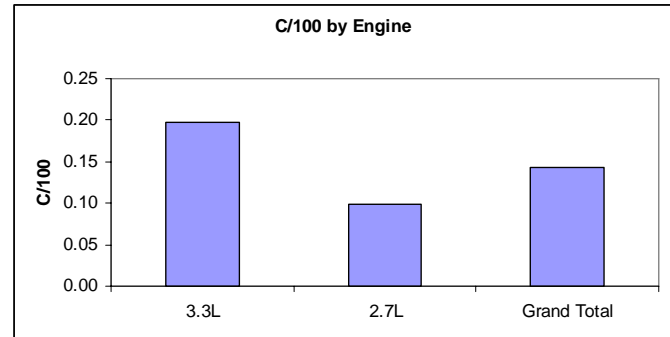

All Data	 All Data
Chart 2 <ul style="list-style-type: none">• Failure rate waterfall chart• A decrease in failure rate is visible after 200612• Claims are increasing again in 200702+	 <p>Op Code Waterfall Chart Production Range - ALL</p>
Chart 3 <ul style="list-style-type: none">• Claims by production date• VIN sold in yellow	 <p>Claims by Production Month vs VIN Count</p>

Stop Lamp Circuit Detail

Brake Lights Off

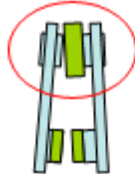

Brake Lights On

Good

Brake Lights On

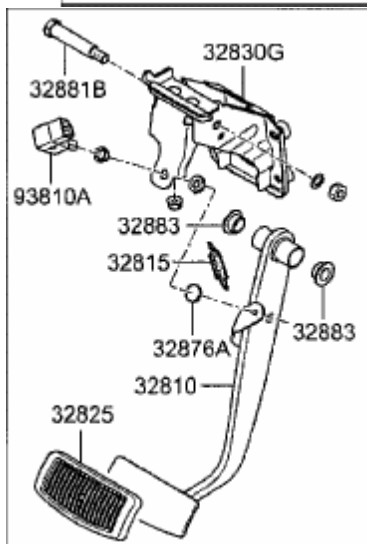

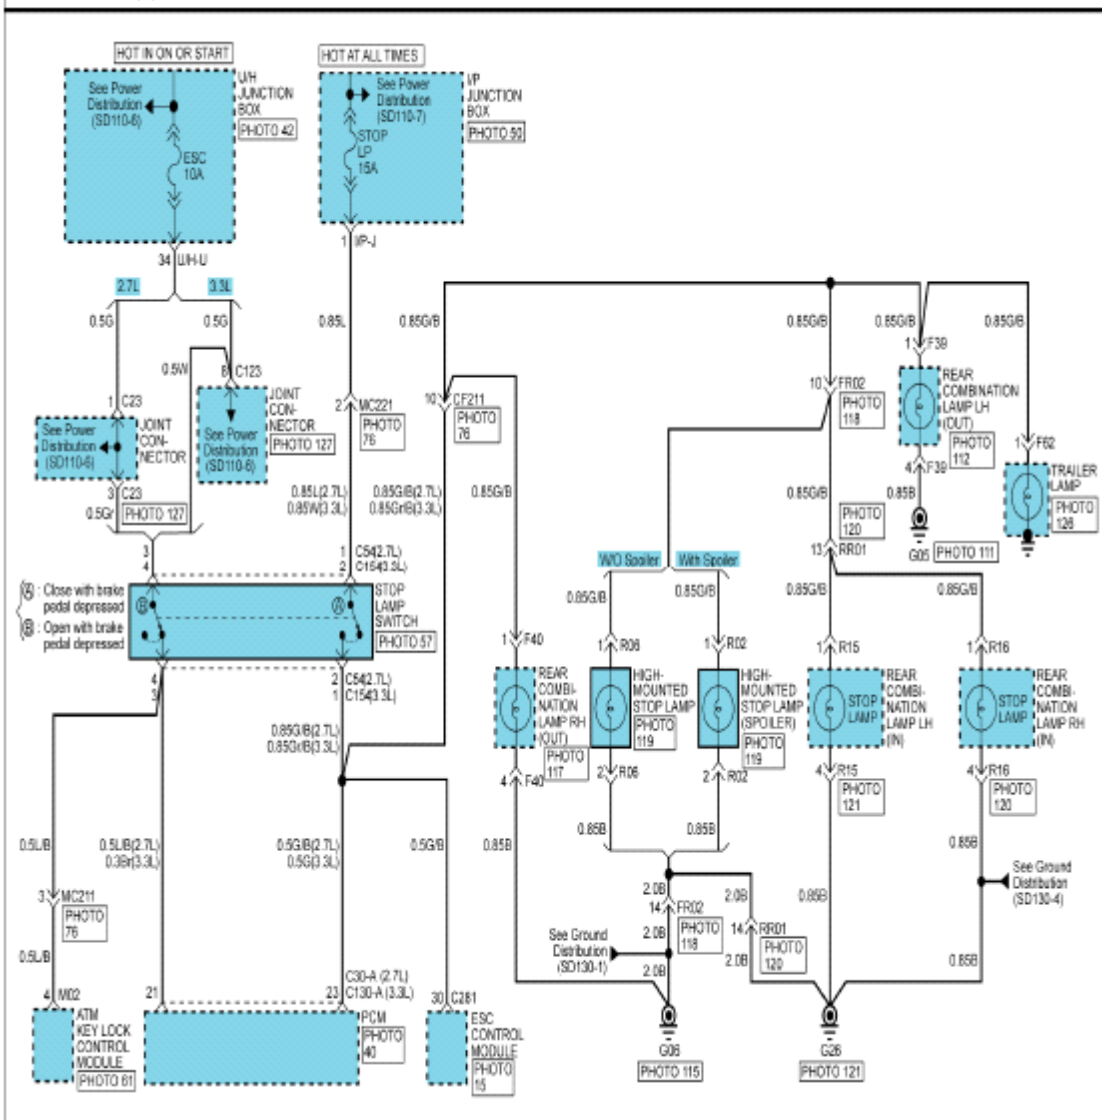

Brake Lights On

No Good

The silver coating (highlighted green) is melting and transferring to the mating contact. The excess flash combined with the distortion on the switch internals prevents the circuit from opening keeping the brake lights illuminated.

KM8NU13C47U [REDACTED]		480	3/15/2007	
Subject*				
[B] INTERMITTENT NO "PARK" RELEASE AND "ESC" LIGHT ON (EARLY WARNING)				

1. Condition:

The customer states that the transmission will not come out of park and have to put the key into the shift lock to release the lock. Additional vehicles with the same condition:

<u>VIN</u>	<u>P/D</u>	<u>MILEAGE</u>
KM8NU73C67U [REDACTED]	1/18/07	1,605
KM8NU73C17U [REDACTED]	2/06/07	2,615

2. Analysis:

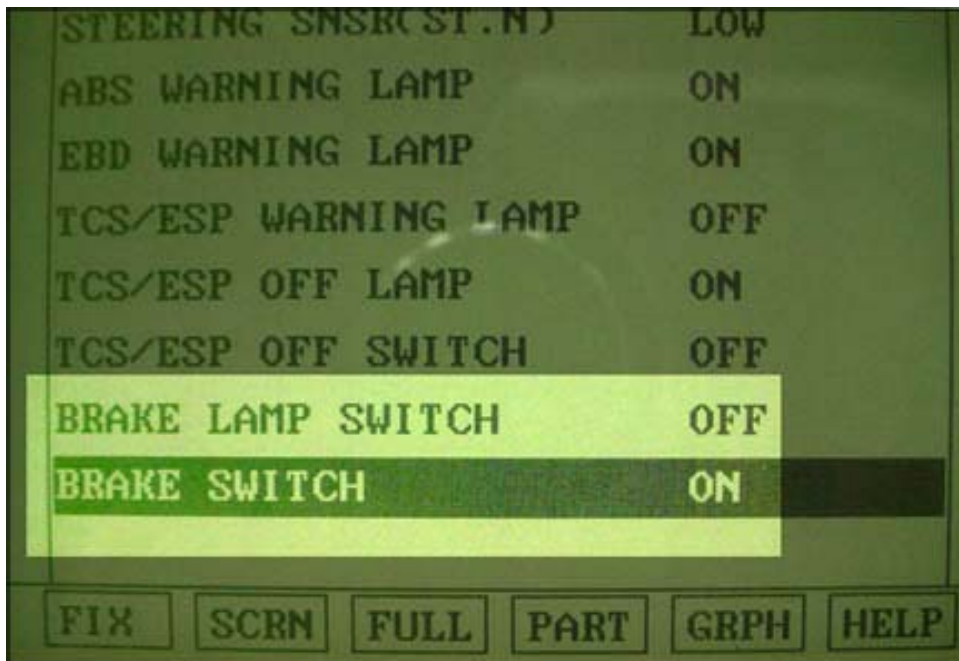

- The dealer technician confirmed the customer's condition.
- The "ESC OFF" light was lit on the dash.
- The Hi-Scan retrieved C1513 code (Brake Switch Error).
- The dealer technician replaced the stop lamp switch assembly, P/N: 93810-3K000, corrected the condition.
- The incident part was sent to HMA for analysis.
- The photo below shows the incident part.

- The static (on the bench) continuity measurement between the pins 1 & 2 and 3 & 4 shows the switch is operating correctly.
- The switch was installed in a Veracruz for checking the dynamic performance of the switch.
- After driving the vehicle, the “ESP OFF” light came on the dash as shown.

- The vehicle was stopped but the gear could not be released from “D” to “R” or “P”.
- At this moment, the Hi-Scan in the Current Data menu provided the following information.

- The “Brake Lamp Switch” should also be ON if the switch is working correctly in the brake pedal depressed condition.
- The switch was left in the vehicle to reproduce this condition one more time.
- The Hi-Scan captured the following code.

1.1 DIAGNOSTIC TROUBLE CODES

C1513 BRAKE LAMP SWITCH

Condition	stop lamp intermittently malfunctioning		P/D = 6/26/2006
Cause	overheating of switch		P/N: 93810-3K000
Countermeasure	Proposal to add reinforced ribs, thicken ribs, knurl end of insert (see attachment) 100% testing of switch in place at HMMA Actual implementation of new parts March 07		
Effective Date		Vehicle ID Number	5NMSG13D97H [REDACTED]

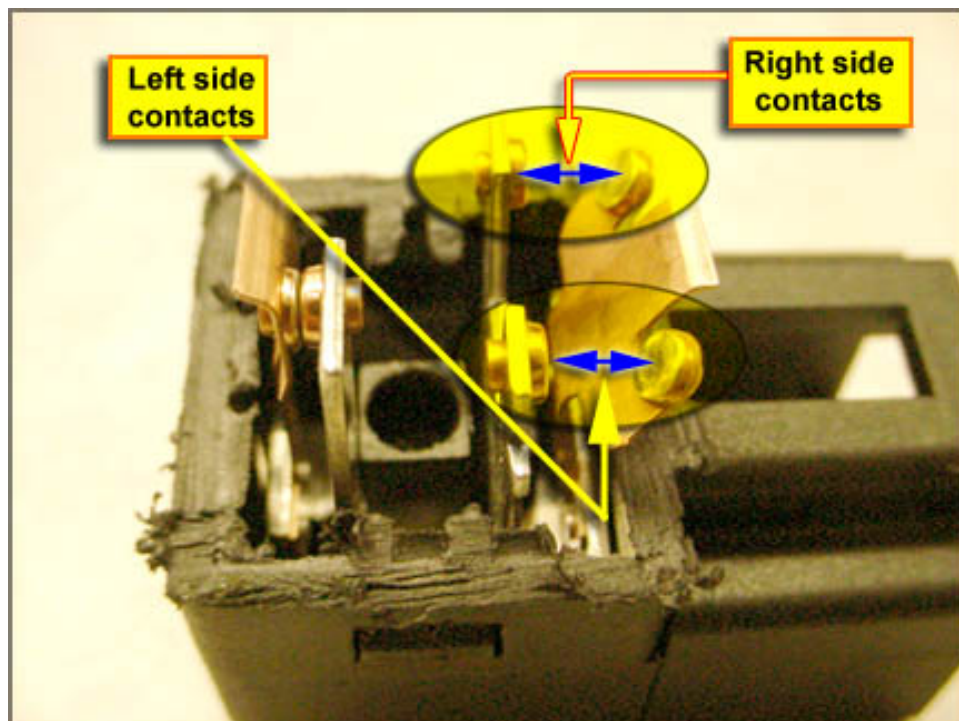

- The cause(s) of this condition is not known; however, following are some possibilities based on the other incident switch that was cut opened for inspection:
 - Plunger may be sticking inside the cylinder due to dimensional variability and/or poor finish on the plastic plunger (see photo below).

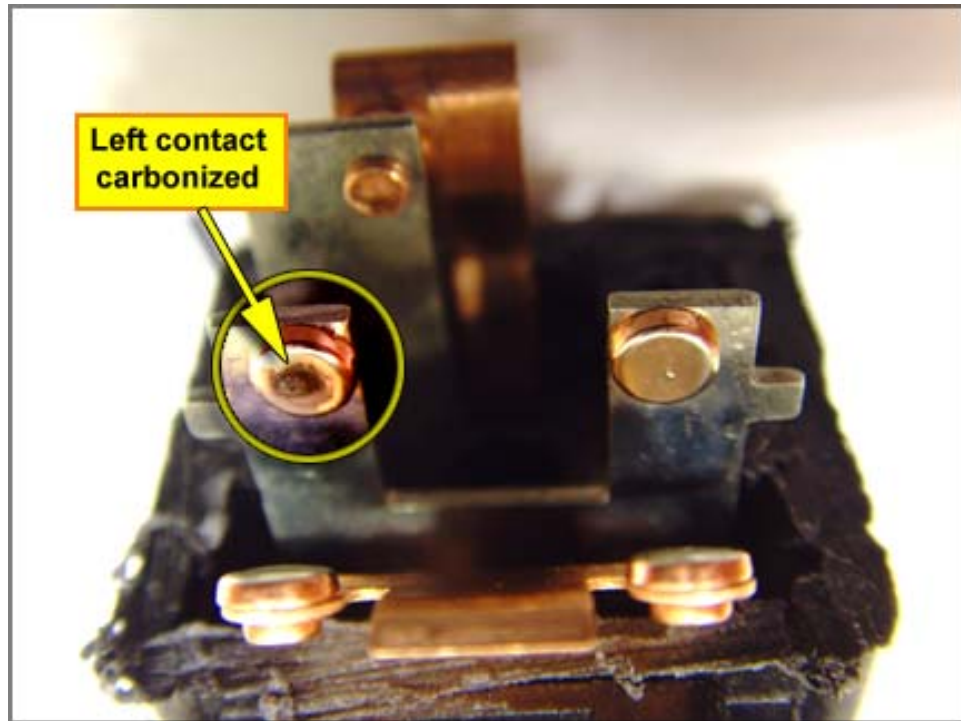

- The photo below shows an incident switch with collapsed plunger inside the cylinder (cause unknown).

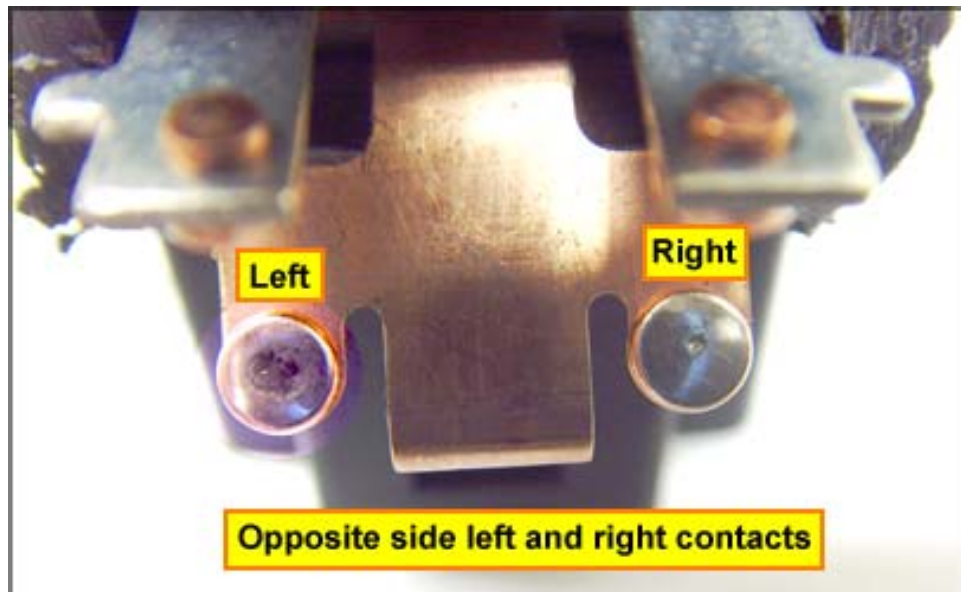

- The stop lamp switch high side contacts (one that operates the tail lamps and sends the signal to activate the shift lock) were found burnt (as shown in the following photographs) that could cause the conditions described in this report.

- The next two photos show the close up of the contacts.

Note: Please note that contacts are flat not “convex”.

- As the contacts become less active, the switch to open or close electrically may delay more than 500ms. This could set a C1513 code if other conditions are met.
- HMA also feels that one stop lamp switch part number applied to many small to large models may not be adequate as the electrical loads are different for each model.
- Excessive play within switch interacting components that could cause mechanical delay of the switch.

- The chart below shows the incident vehicle repair order.

3. Action:

- Replace stop lamp switch assembly, P/N: 93810-3K000.

4. Comment/Recommendation:

- HMC should test the incident stop lamp switch in the vehicle to determine the cause(s) of this condition and apply corrections as necessary to improve this condition.
- HMA feels that switch design, particularly switch contact size and shape may be an issue here.
- HMC should open the switch with the collapsed plunger to determine the cause of this condition and apply corrections as necessary.

Effective Date		Vehicle ID Number

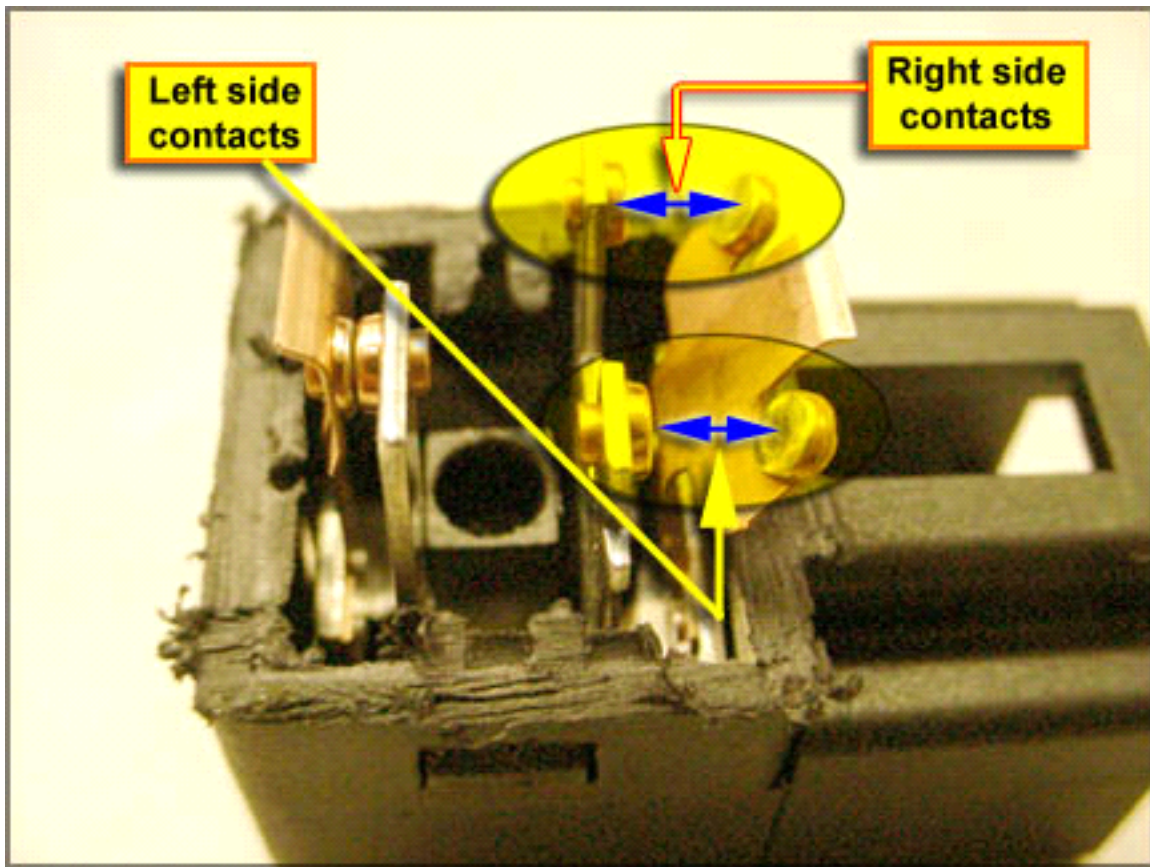

- The cause(s) of this condition is not known; however, following are some possibilities:
 - Plunger may be sticking inside the cylinder due to dimensional variability and/or poor finish on the plastic plunger (see photo below).

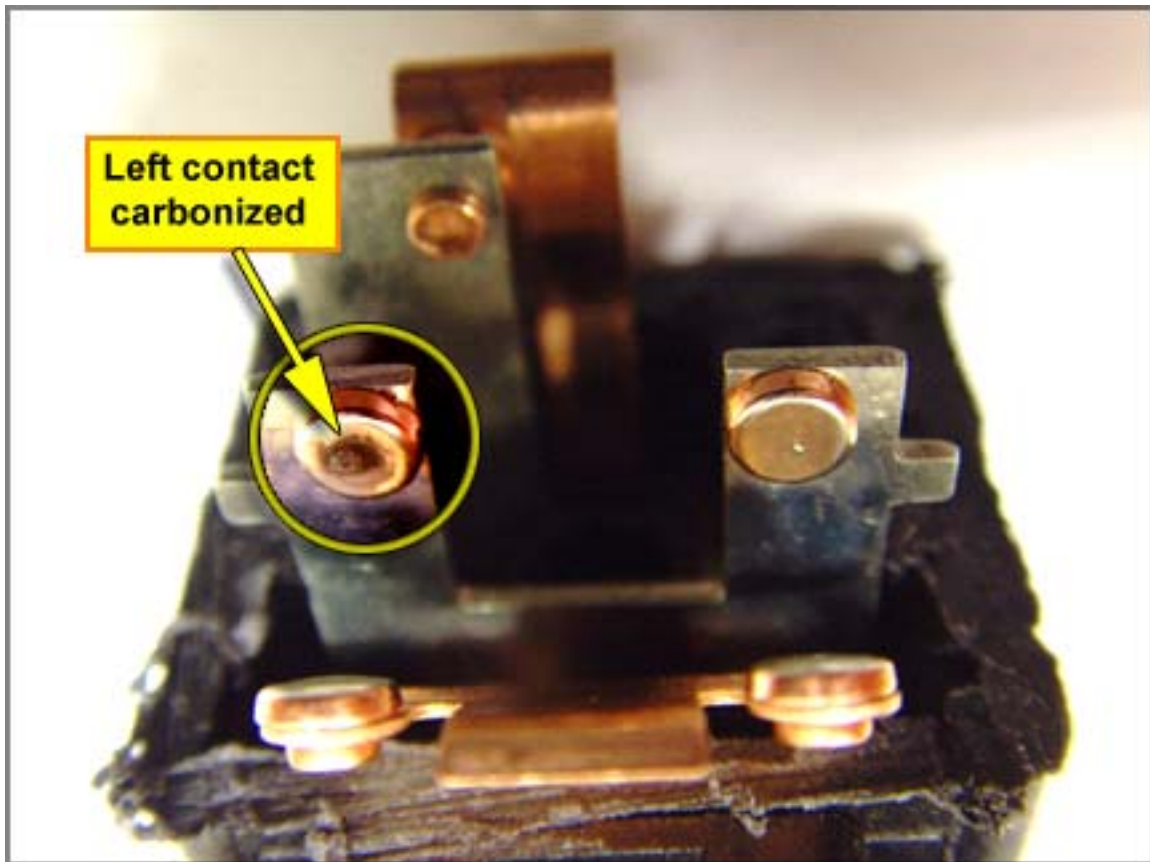

- The photo below shows an incident switch with collapsed plunger inside the cylinder (cause unknown).

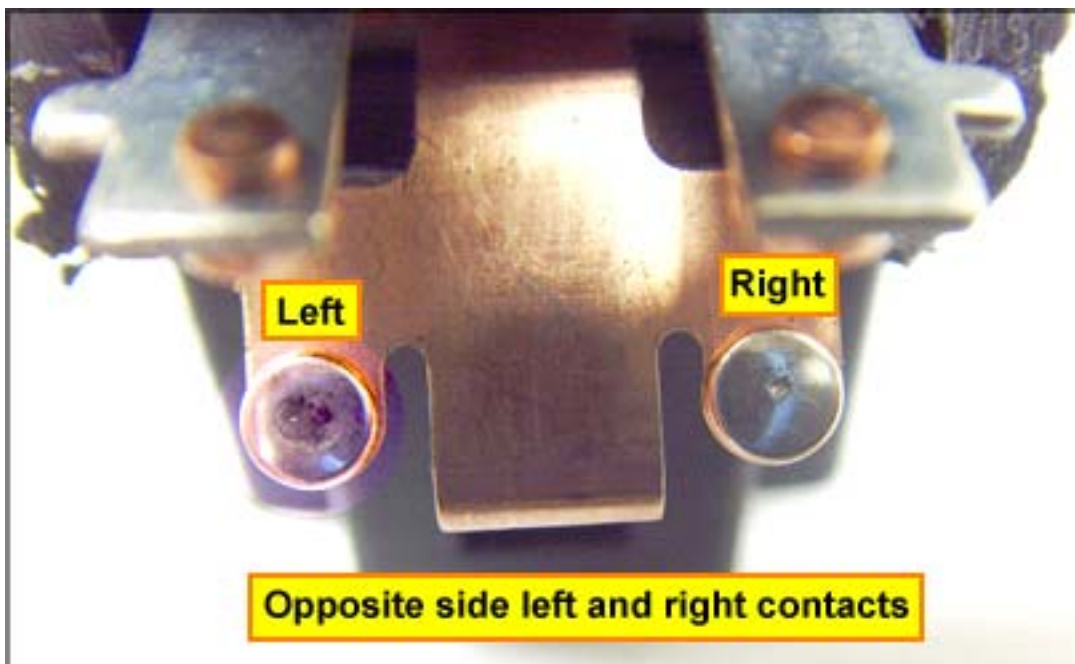

- The stop lamp switch high side contacts (one that operates the tail lamps and sends the signal to activate the shift lock) were found burnt (as shown in the following photographs) that could cause the conditions described in this report.

- The next two photos show the close up of the contacts.

Note: Please note that contacts are flat not "convex".

- As the contacts become less active, the switch to open or close electrically may delay more than 500ms. This could set a C1513 code if other conditions are met.

- HMA also feels that one stop lamp switch part number applied to many small to large models may not be adequate as the electrical loads are different for each model.

Excessive play within switch interacting components that could cause mechanical delay of the switch.

- The chart below shows the incident vehicle repair order.

Corrective Action:

Date: 05/15/2007

Report Number : QAEN-C-070513

- Replace stop lamp switch assembly, P/N: 93810-3K000.

Comments and Recommendations:

Date: 05/15/2007

Report Number : QAEN-C-070513

- HMC should test the incident stop lamp switch in the vehicle to determine the cause(s) of this condition and apply corrections as necessary to improve this condition.
- HMA feels that switch design, particularly switch contact size and shape may be an issue here.
- HMC should open the switch with the collapsed plunger to determine the cause of this condition and apply corrections as necessary.

1. Condition:

Note:

- This QIR documents EN Stop Lamp Switch claims after the countermeasure date of 12-03-06. (QIS for QIR QAEN-C-070513 shown below).
- Stop Lamp Switch, part number 93810-3K000, is also used in many other HMC vehicles such as the HD (QAHD-L-080702).

Customer statement:

- Customer states ESC light is illuminated. Necessary to use override feature to shift into "D".
- Customer states shift lever sticks when engaging into gear and ESC light comes on.
- Customer states that at times ESC light illuminates and will not come out of "P".

- **Technician statement:** Tech found code C1513, Stop Lamp Switch Circuit. -- Intermittent Stop Lamp switch operation.

2008 JD Power IQS Scores (Syndicated Study)

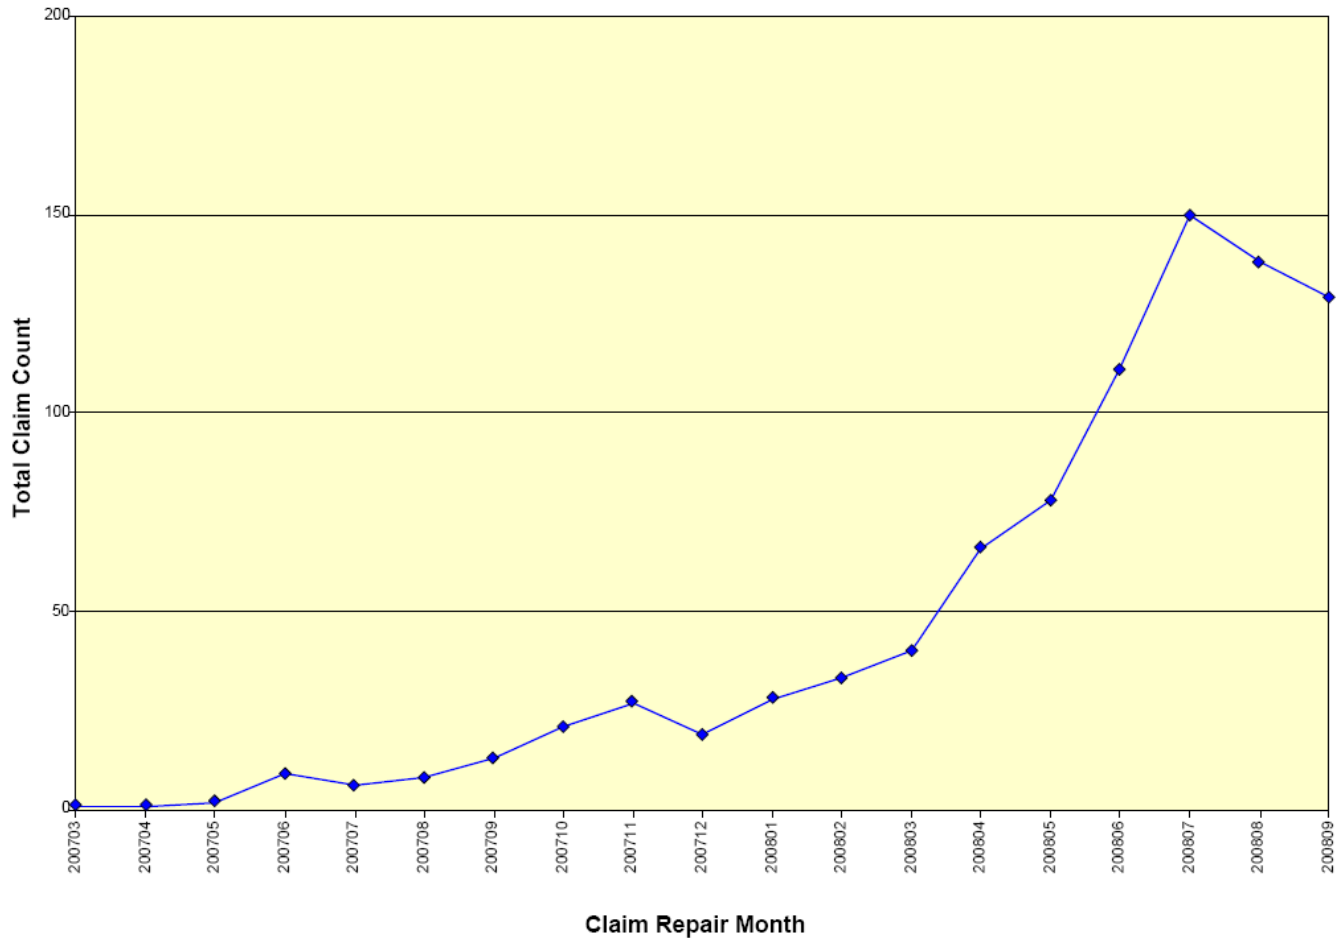

- There are generally two (2) symptoms that accompany Stop Lamp Switch failures (improper shift lever operation or ESC light illuminated).
- Since there is **no JD Power survey question specifically pertaining about ESC**, the survey question: "T14: Auto Trans-Gearshift Hard to Operate" data was reviewed. Please refer to 2008 IQS score chart above.
- The 2008 IQS scores suggest that there is an area of opportunity for improvement (many competitors score 0.0 PP100) for "Auto Trans-Gearshift Hard to Operate".

■ **Warranty analysis:**

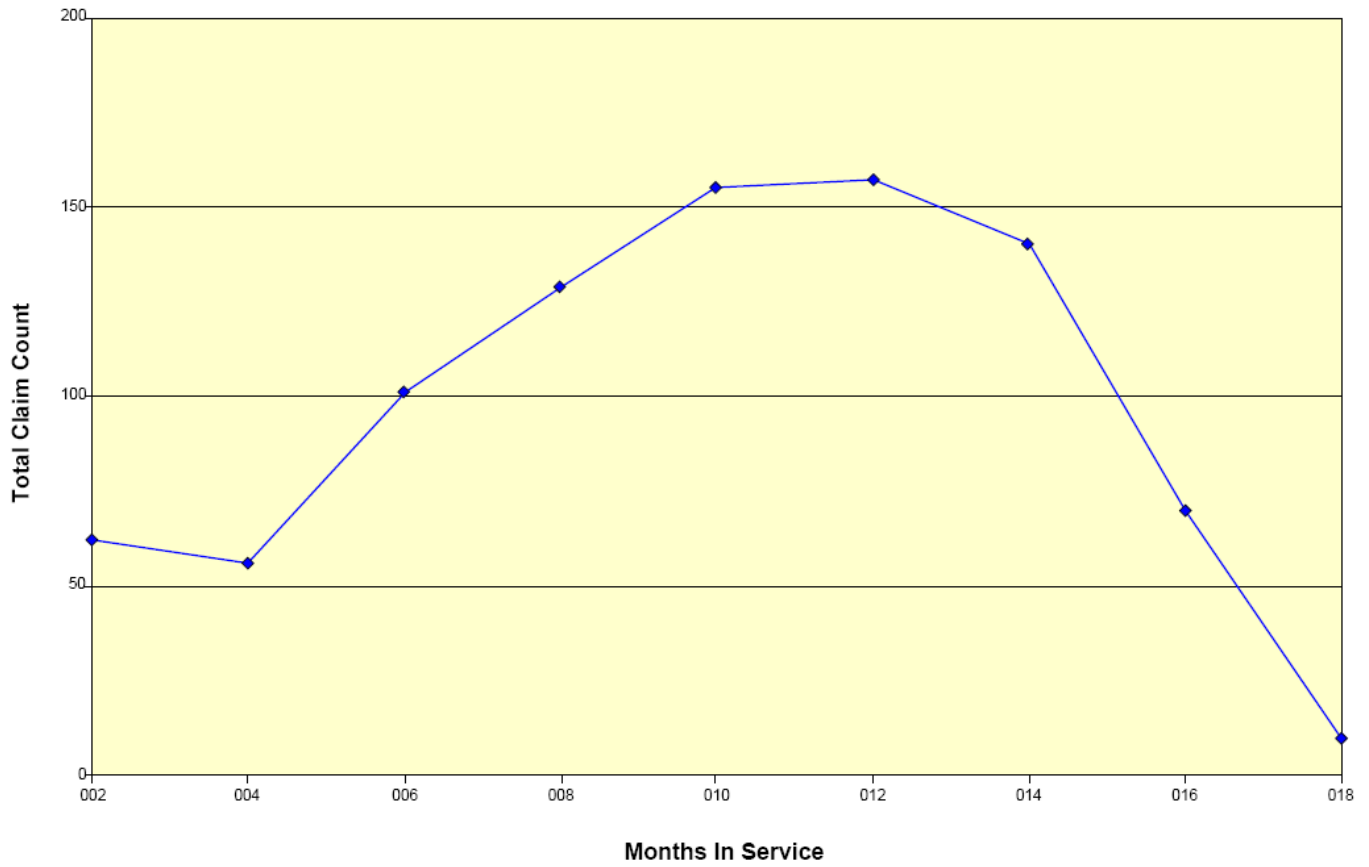

- Warranty data analyzed reveals that most claims occur between 10 and 12 months in service.

Business Processing Date : 09-26-2008
Run Date : 09/29/08 04:05 PM

- Total EN warranty dollars at this time: ~\$31,000 approximately \$38 per claim.
- This condition, when looking at “the bigger picture” is an opportunity to improve IQS and VDS scores.
- The chart below shows Stop Lamp Switch claims for all Hyundai models for vehicles produced after January 2008. The data suggests that improvements to the Stop Lamp Switch should help improve reliability and the perception of quality for all Hyundai models.

3. Action:

- **Dealer fix**
 - Dealers diagnose using scan tool and replace incident stop lamp switch to resolve.
- **Repair procedure**
 - Remove and replace according to the service manual.

4. Comment/Recommendation:

- **Production C/M**
 - HMC should develop a more robust Stop Lamp Switch to prevent setting ESC codes and prevent transmission shift lever interlock concerns.
 - HMA will collect incident parts and forward them to HMC.
- **Port action**
 - A port campaign and countermeasure parts will be required.
- **Field fix**
 - HMC should develop improved parts, and purge old stock of the 93810-3K000 Stop Lamp Switch.
- **TSB**
 - HMC should develop a TSB to advise dealers regarding diagnosis and countermeasure parts along with proper old and part identification.
- **C/M Part:**
 - An effective countermeasure should be developed for field/port repairs.
- **Other comment**

- o N/A.

[B] STOP LAMP SWITCH WARRANTY (EARLY WARNING)				

1. Condition:

.The customer complained that both the ABS and ESC indicator lights are ON. Additional vehicle with same condition.

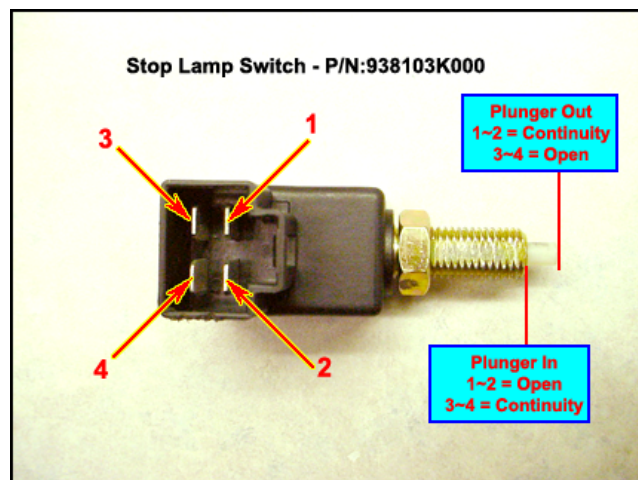

VIN
KNDMC233376 [REDACTED]

P/DATE
3/23/2006

MILEAGE
812

2. Analysis:

- The dealer technician confirmed the customer complain.
- Both ABS and ESP indicator lights were ON
- Hi-Scan retrieved P0571 (Cruise/Brake switch circuit malfunction) and C1513 (Brake Switch Error) DTC codes.
- The dealer technician replaced the stop lamp switch, P/N:93810-3K000, that corrected the condition.
- Both incident stop lamp switches were sent to HMA for analysis.
- The photo below shows the incident switch and the continuity check results.
- Accordingly, the stop lamp switch was determined to be OK (static condition).

- The second incident vehicle switch was also checked out OK.
- The TABLE below shows all replaced stop lamp warranty.

			\$256.30

- Since both incident stop lamp switches checked out OK, and since both incident vehicles were produced on the same day (2006-03-23), HMA suspects that both of these (and possibly others also) incidents were caused by the assembly line workers not adjusting the stop lamp switch correctly.
- If the switches are not properly adjusted, they may set P0504, P0571 and C1513 DTC codes.
- In service, the technicians generally would replace the switch first and then adjust it correctly just to avoid a customer comeback.
- Therefore, it is very important that HMC adjust all stop lamp switches correctly on the assembly line.

Additional Information:

- Since this part number is common to many models, and since the incident parts checked out OK per HMC's procedure, it is strongly believed that the switch adjustment is the issue here.

3. Action:

Replace the stop lamp switch, P/N:93810-3K000.

4. Comment/Recommendation:

- HMC should check both incident parts to determine the root cause of these incidents and apply corrections as necessary.

Condition:

Date: 08/10/2006

Report Number :

The customer complained that both the ABS and ESC indicator lights are ON. Additional vehicle with same condition.

VIN	P/DATE	MILEAGE
KNDMC233376 [REDACTED]	3/23/2006	812

Analysis:

Date: 08/10/2006

Report Number :

- The dealer technician confirmed the customer complain.
 - Both ABS and ESP indicator lights were ON
 - Hi-Scan retrieved P0571 (Cruise/Brake switch circuit malfunction) and C1513 (Brake Switch Error) DTC codes.
 - The dealer technician replaced the stop lamp switch, P/N:93810-3K000, that corrected the condition.
 - Both incident stop lamp switches were sent to HMA for analysis.
 - The photo below shows the incident switch and the continuity check results.
 - Accordingly, the stop lamp switch was determined to be OK (static condition).
- □□□□□□□□ Since both incident stop lamp switches checked out OK, and since both incident vehicles were produced on the same day (2006-03-23), HMA suspects that both of these (and possibly others also) incidents were caused by the assembly line workers not adjusting the stop lamp switch correctly.
 - If the switches are not properly adjusted, they may set P0504, P0571 and C1513 DTC codes.
 - □□□□□□□□ In service, the technicians generally would replace the switch first and then adjust it correctly just to avoid a customer comeback.
 - □□□□□□□□ Therefore, it is very important that HMC adjust all stop lamp switches correctly on the assembly line.

Additional Information:

- Since this part number is common to many models, and since the incident parts checked out OK per HMC's procedure, it is strongly believed that the switch adjustment is the issue here.

Corrective Action:

Date: 08/10/2006

Report Number :

Replace the stop lamp switch, P/N:93810-3K000.

Comments and Recommendations:

Date: 08/10/2006

Report Number :

- HMC should check both incident parts to determine the root cause of these incidents and apply corrections as necessary.

Incident part/vehicle analysis

The Stop Lamp Switch (brake switch) is part number 93810-3K000.

The date code on the incident part is "7J04", well after the countermeasure date code of "7114" indicated for the same part number in the EN QIR QAEN-C-070513. HMC indicated the stop lamp was improved on 09/27/07:
"Improved plunger diameter tolerances"

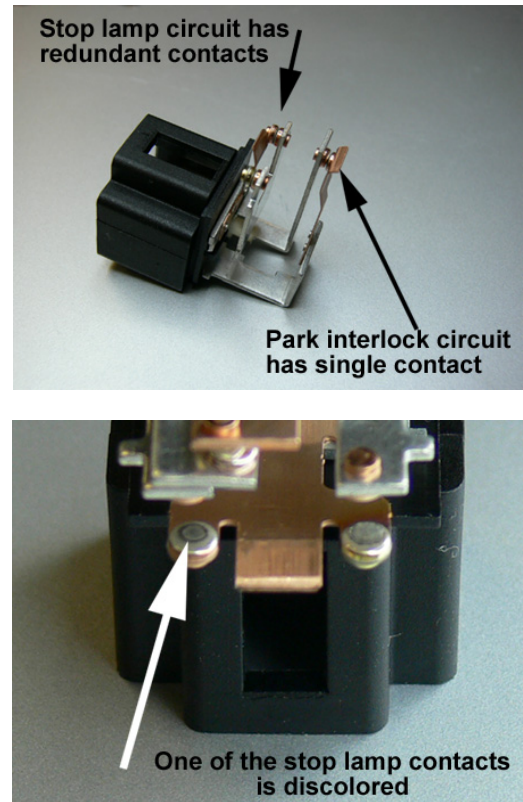

The stop lamp circuit through the switch has redundant contacts. When the incident stop lamp switch was evaluated at HMA, the resistance measured through the switch was good:

- Open circuit when the plunger was depressed
- Closed circuit when the plunger was released

Upon inspection of the switch contacts, HMA noted that one of the contacts was discolored.

The discoloration may be an indication of contamination that could lead to intermittent operation.

The continued warranty claims after the countermeasure indicates the countermeasure was not fully effective. The continued rate is under 0.2% for November production, but it is continuing to increase as the vehicles age.

3. Action:

- **Dealer fix**
Dealers replace the stop lamp switch as necessary
- **Repair procedure**
Remove and replace as per the shop manual

4. Comment/Recommendation:

- **Production C/M**
HMC needs to work with the vendor, "INFAC", to develop a trouble free stop lamp switch that will not set codes for the ESC or prevent the shift interlock from operating.

HMA will return the incident part to HMC. HMA will continue to collect incident switches and will send them when available.

- **Port action**
No port action required
- **Field fix**
HMC should ensure the improved part is applicable to all vehicles currently using the p/n 93810-3K000 switch
- **TSB**
No TSB required.
- **C/M Part:**
HMA would like 5 sample countermeasure parts after the countermeasure is developed

- **Technician statement:**
 - Technician verified the condition and retrieved the DTC C1513 (Brake Switch Error) code.
- **Customer driving habit / operation condition:**
 - Stop and go with extended period of stopping with brakes applied.
- **Road condition:**
 - City roads
- **Weather condition:**
 - Humid
- **Vehicle speed:**
 - Low speeds under 20 mph
- **Number of passengers:**
 - One
- **Region:**
 - Western
- **Other comments:**
 - None

2. Analysis:

- The incident vehicle had three previous repairs as shown below.

WPC008 M00021791		Hyundai Motor America		11/29/2007

- At the 4th repair, FSE (Field Service Engineer) got involved to determine the cause of the multiple repairs.
- The incident switch was cut open to monitor the dynamics of the DTC C1513 setting as shown.

- The diagram below provides the following information:
- The picture to the right is a page from the electrical troubleshooting manual (ETM) that shows brake light switch inputs to the electronic stability control (ESC) control unit.
- The switch between terminals 2 and 4 is the brake light switch that closes when the brakes are applied. Output 12V.
- The switch between terminals 3 and 4 is the brake switch that opens when the brakes are applied. Output 0 V.

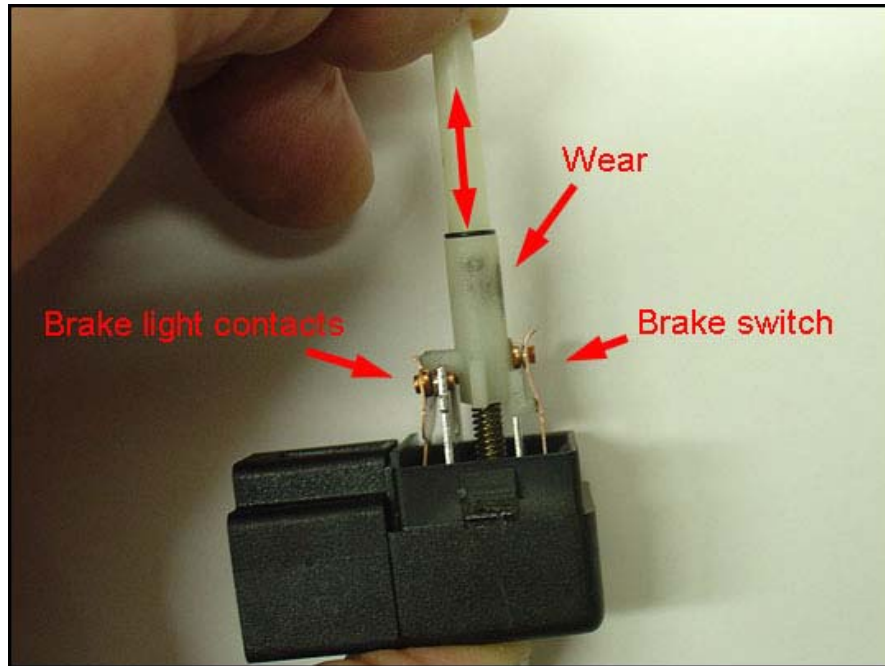

- If the ESC control module sees both brake switch and brake light switch in the same state for >500ms and the brake pressure is >20 bar DTC C1513 is set.

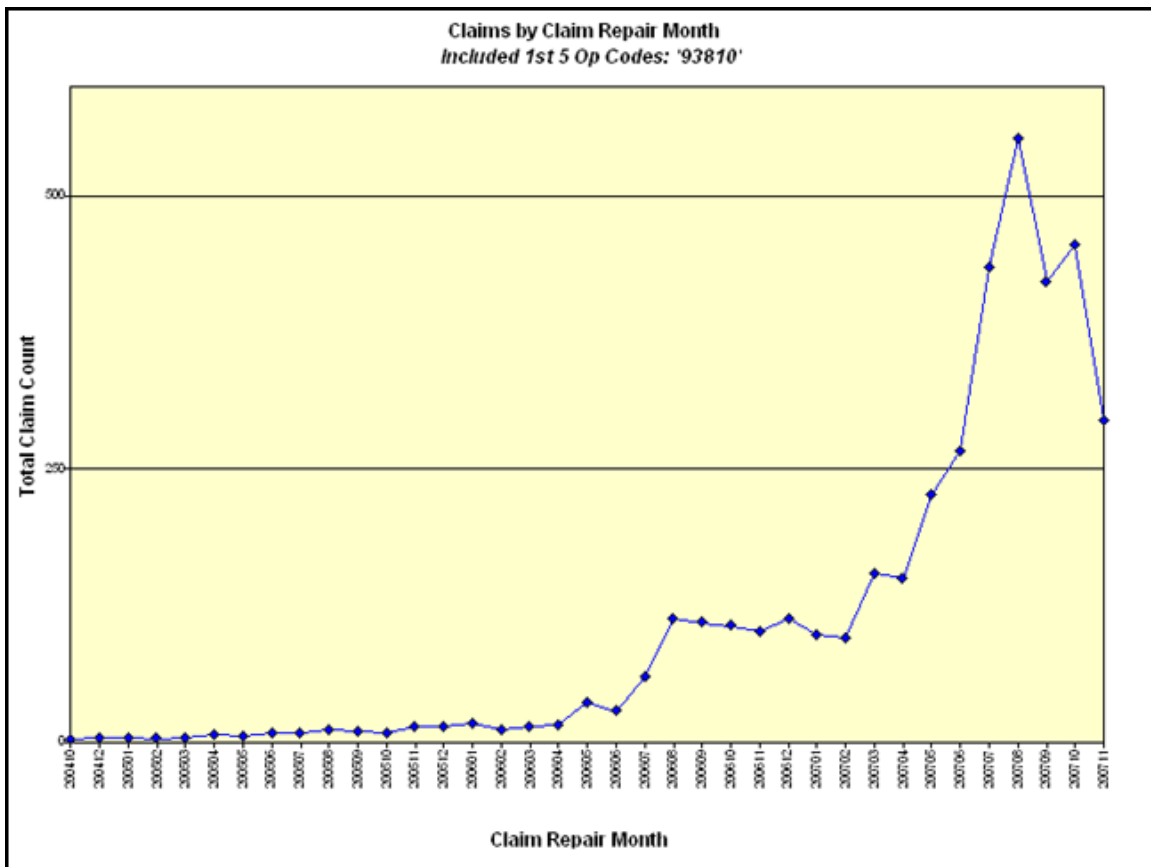

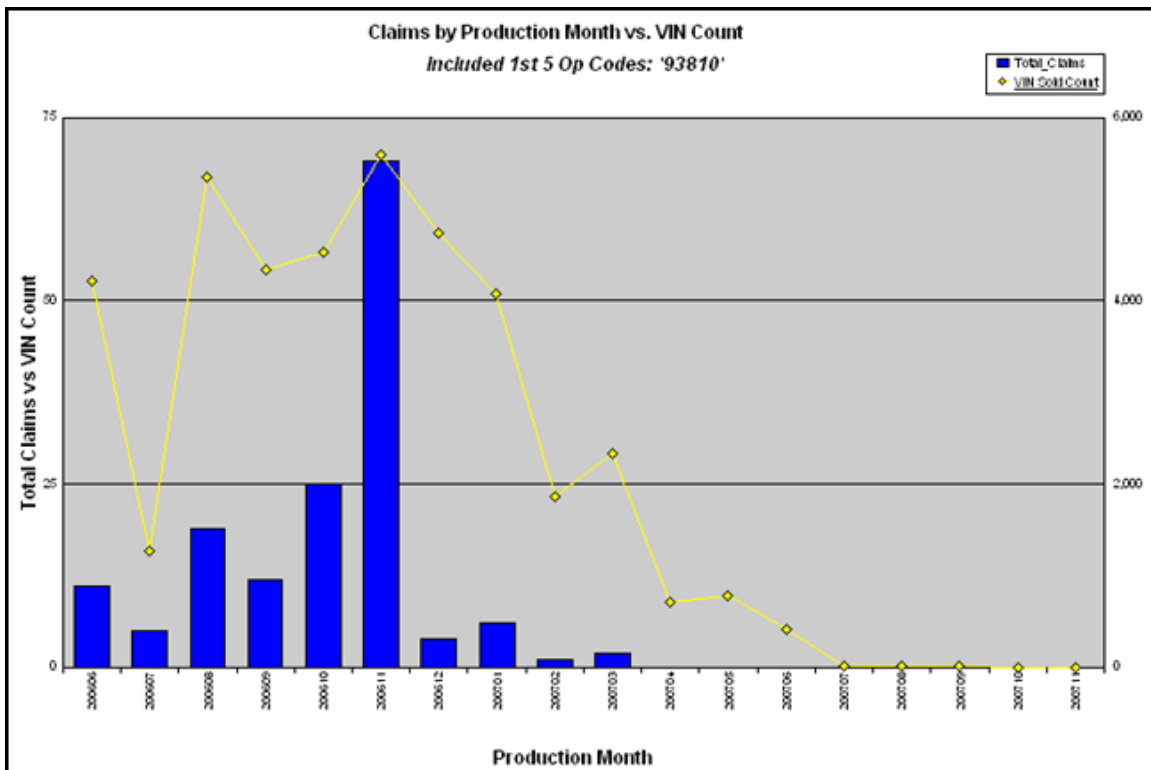

- The brake pressure and brake switch voltage was monitored that set the DTC C1513 as shown.
- The picture below shows the event that set the DTC C1513. The brake light switch is on, the brake switch is on and the brake pressure is >20 bar.
- The brake lights were ON during the event.

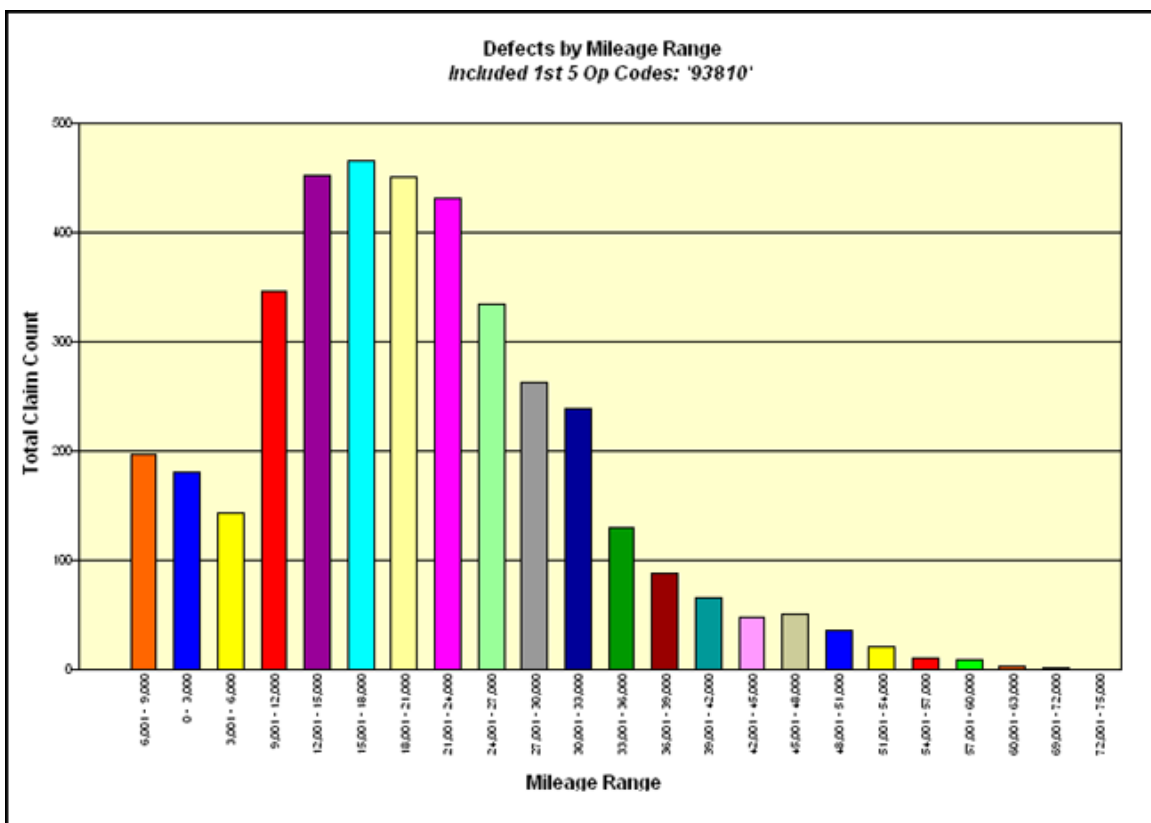

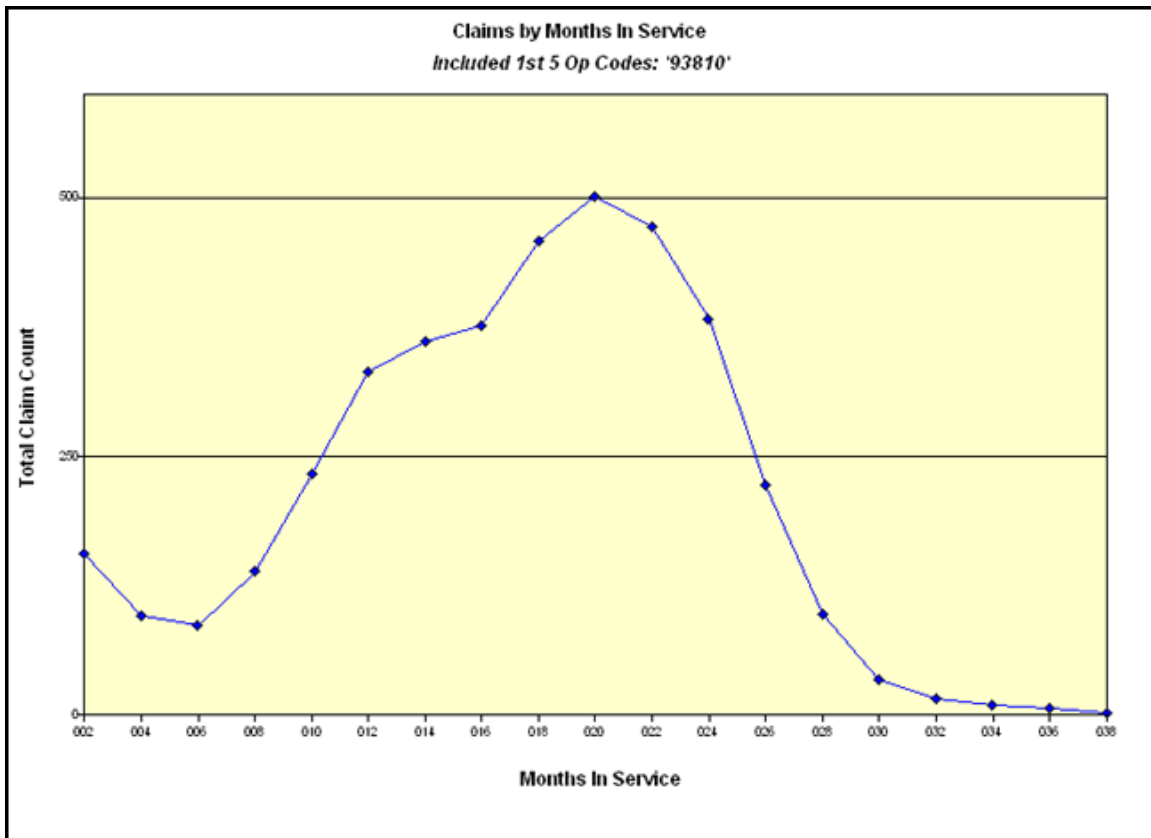

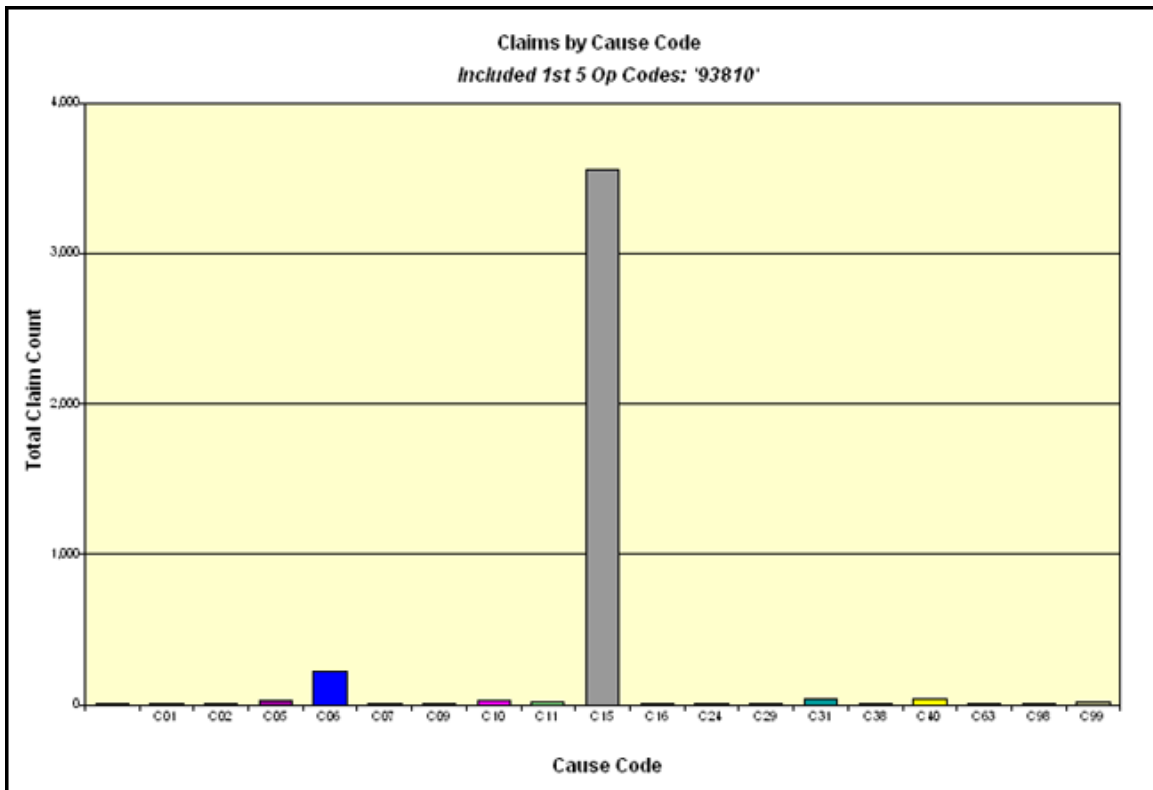

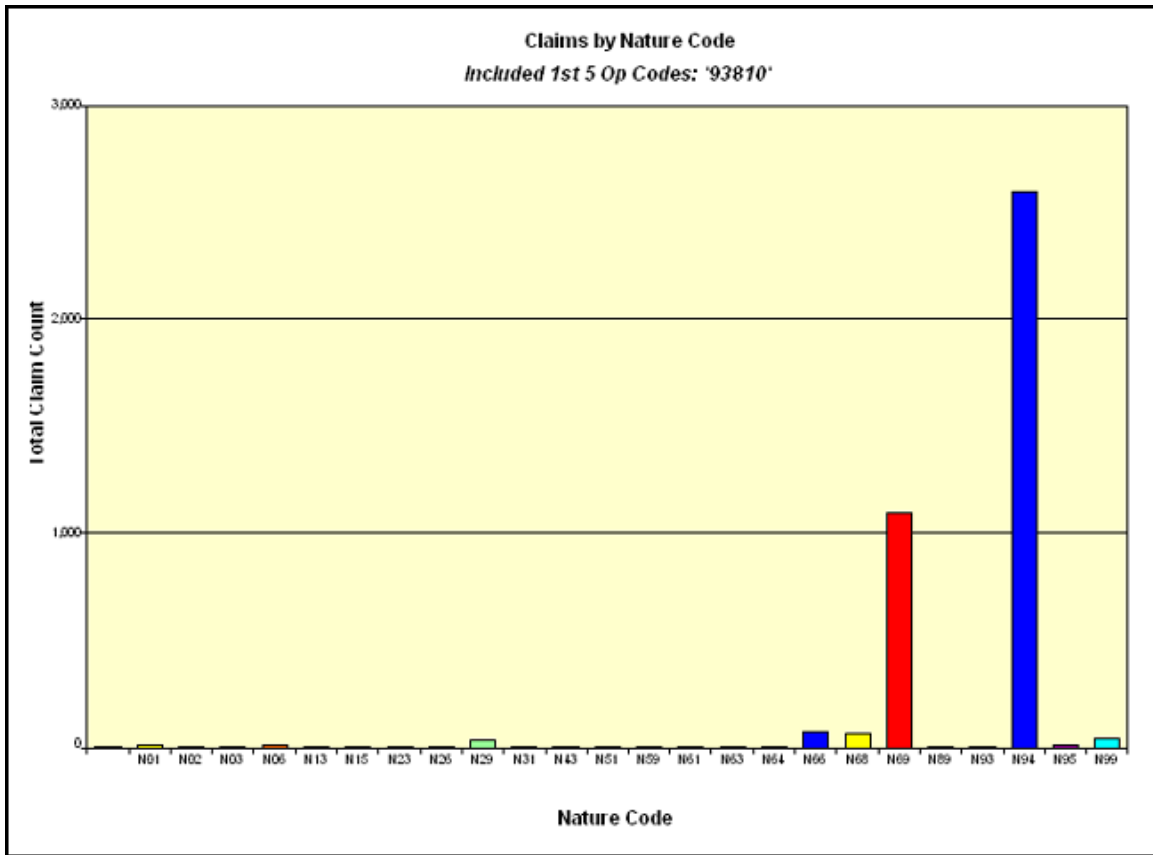

- The picture below shows the internal components of the brake light switch.
- After extended operation, the "Brake Switch" contacts closed with brake pressure present and the brake lights on, causing the DTC C1513 to set.

- From this exercise, the following was realized:
 - That the DTC C1513 can occur if one of the following conditions can occur:
 - Brake switch contacts get hot and loose the continuity
 - Brake contacts burn out
 - Plunger hang-up in the cylinder
 - Switch not adjusted correctly
 - Grease in the switch may contaminate the contacts
 - One of the connectors in the harness loses contact
 - Brake pressure switch acts erratically
- The part warranty data provides the following information:

4. Comment/Recommendation:

- **Production C/M:**
 - HMC should investigate this condition and apply corrections as soon as possible.
- **Port action:**
 - Not required at this time as replacement part may or may not correct the condition permanently.
- **Field fix:**
 - Required from HMC as soon as improved parts are available.
- **TSB:**
 - HMC should provide a TSB with the improved parts.
- **Other comment:**
 - As the stop lamp switch also provides input to auto shift release, sometimes customers complain that the shifter cannot be released from the PARK position.

- At the 4th repair, FSE (Field Service Engineer) got involved to determine the cause of the multiple repairs.
- The incident switch was cut open to monitor the dynamics of the DTC C1513 setting as shown.

- The diagram below provides the following information:
- The picture to the right is a page from the electrical troubleshooting manual (ETM) that shows brake light switch inputs to the electronic stability control (ESC) control unit.

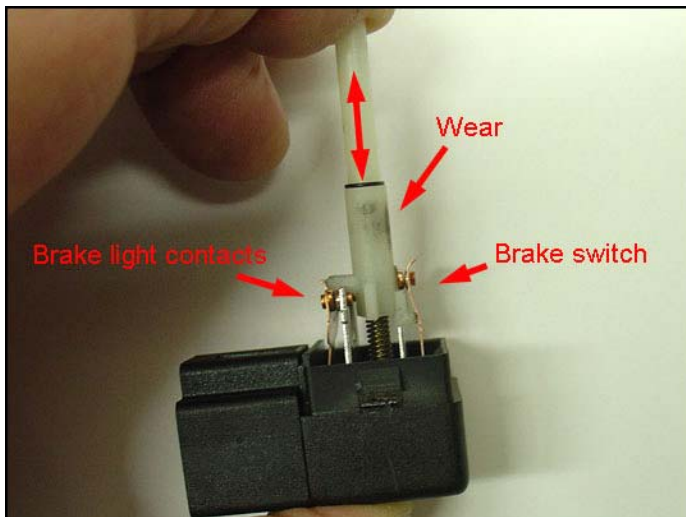

- The switch between terminals 2 and 4 is the brake light switch that closes when the brakes are applied. Output 12V.
- The switch between terminals 3 and 4 is the brake switch that opens when the brakes are applied. Output 0 V.
- If the ESC control module sees both brake switch and brake light switch in the same state for >500ms and the brake pressure is >20 bar DTC C1513 is set.

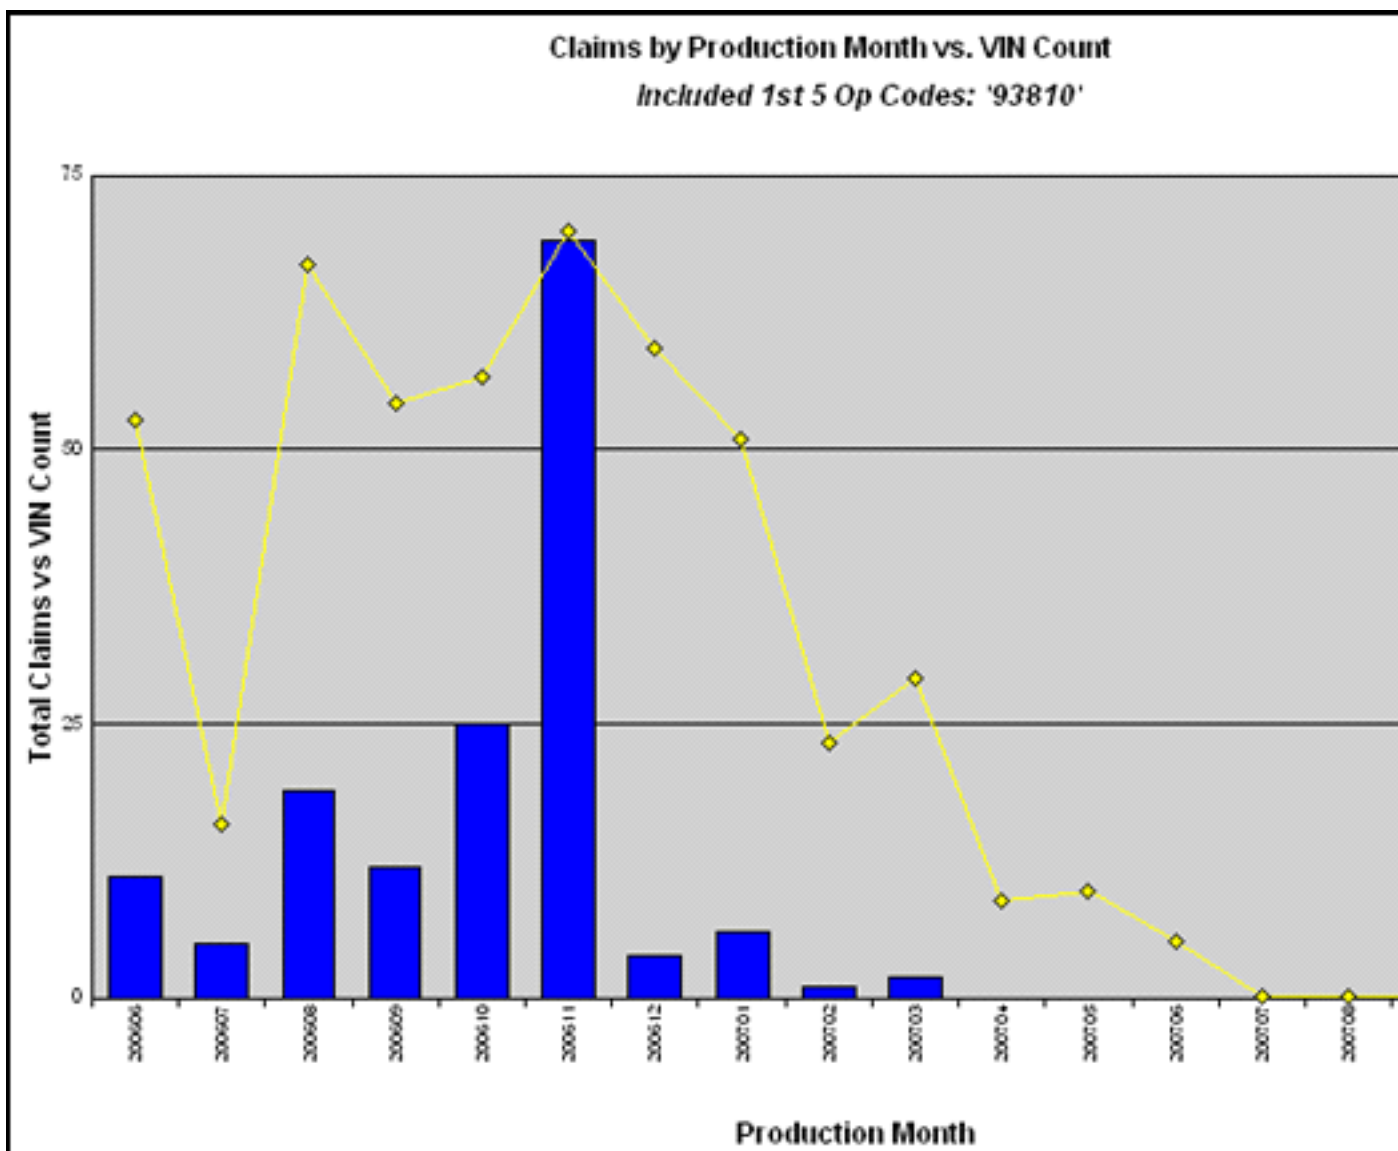

- The brake pressure and brake switch voltage was monitored that set the DTC C1513 as shown.
- The picture below shows the event that set the DTC C1513. The brake light switch is on, the brake switch is on and the brake pressure is >20 bar.
- The brake lights were ON during the event.

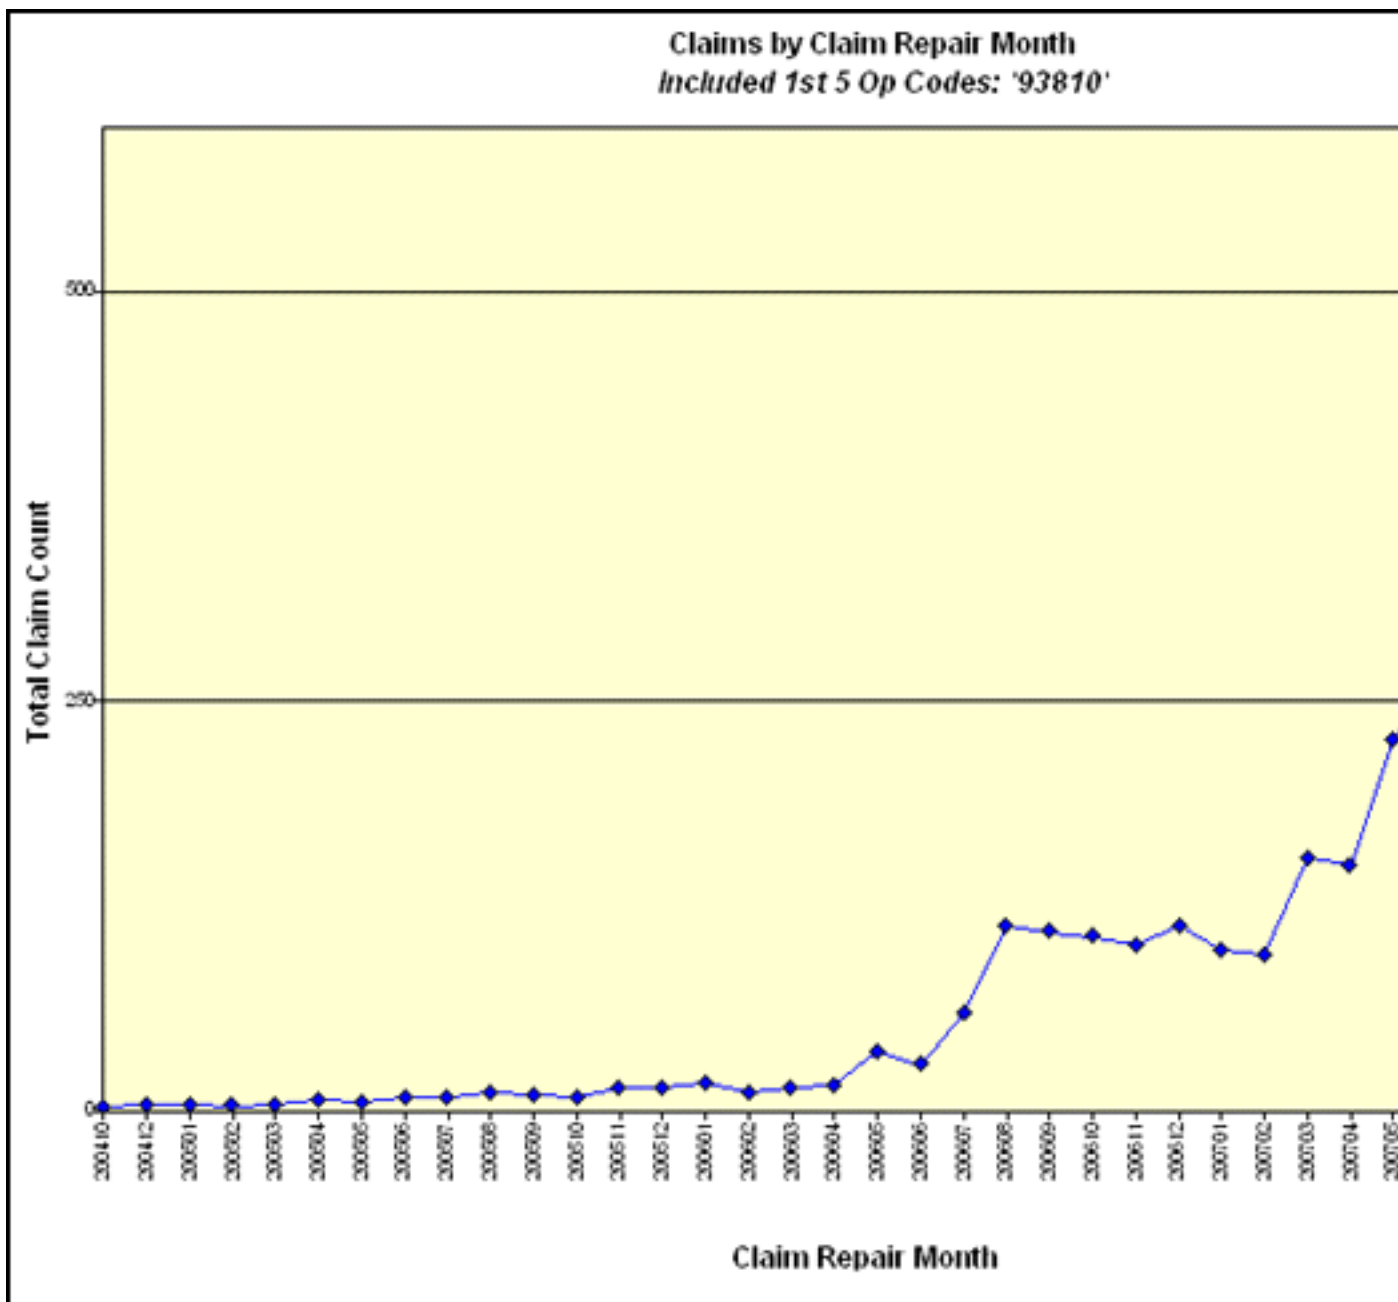

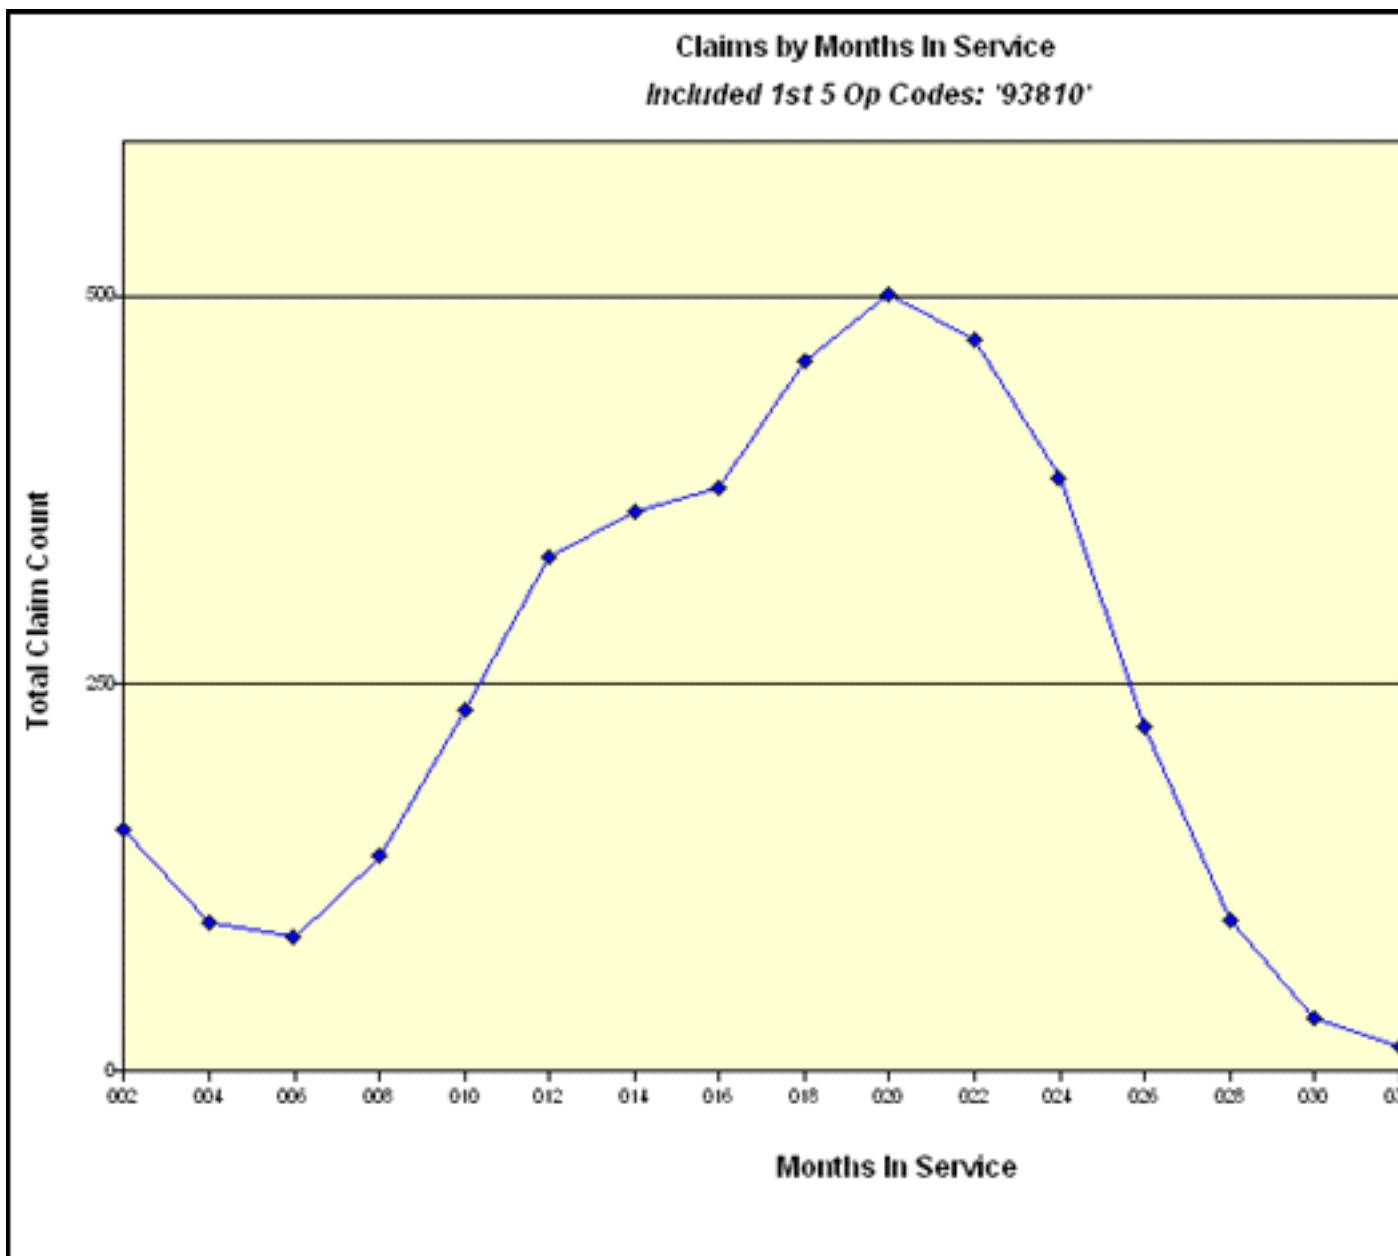

- The picture below shows the internal components of the brake light switch.
- After extended operation, the “Brake Switch” contacts closed with brake pressure present and the brake lights on, causing the DTC C1513 to set.

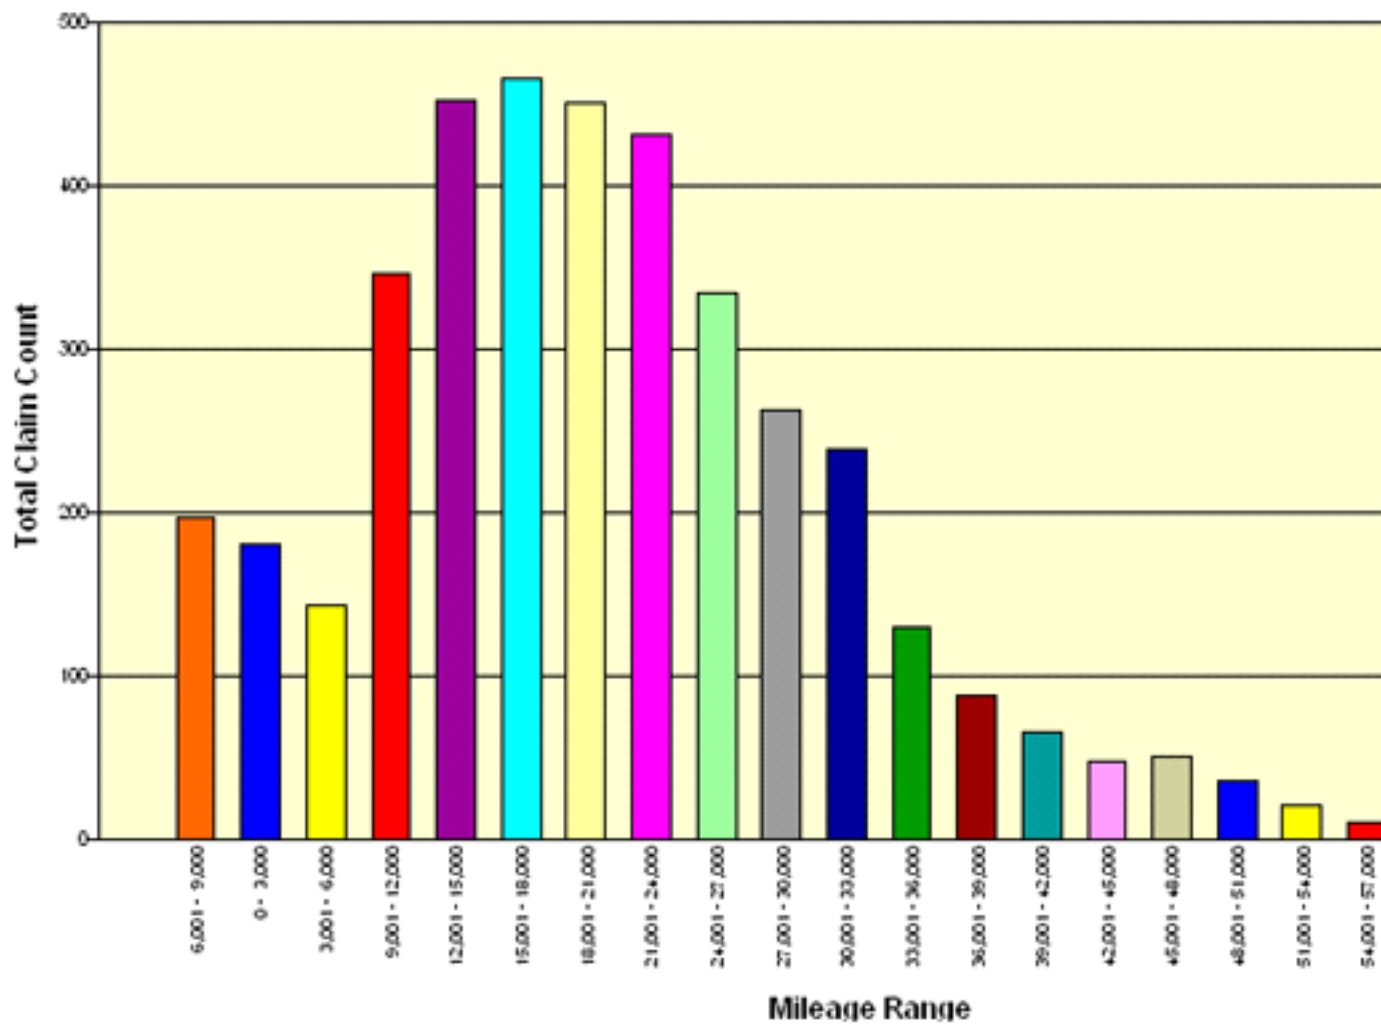

- From this exercise, the following was realized:
 - That the DTC C1513 can occur if one of the following conditions can occur:
 - Brake switch contacts get hot and loose the continuity
 - Brake contacts burn out
 - Plunger hang-up in the cylinder
 - Switch not adjusted correctly
 - Grease in the switch may contaminate the contacts
 - One of the connectors in the harness looses contact
 - Brake pressure switch acts erratically
- The part warranty data provides the following information:

Corrective Action:

Date:

Report Number : QAJM-C-071104

- **Dealer fix:**
 - Replace brake switch, P/N: 93810-3K000.
Note: Many times replacing the switch corrects the condition for a while but the vehicle returns as was the situation in this incident. The driver was advised not to hold the brake for an extended period.
- **Repair procedure:**
 - Replace stop lamp switch using the procedure provided in the shop manual
Note: The TABLE below provides the part history. The warranty shows that there is a high warranty for all parts meaning the improved parts do not correct the incident conditions. This part is common to many models and similar warranty shows on other models also.

Comments and Recommendations:

Date:

Report Number : QAJM-C-071104

- **Production C/M:**
 - HMC should investigate this condition and apply corrections as soon as possible.
- **Port action:**
 - Not required at this time as replacement part may or may not correct the condition permanently.
- **Field fix:**
 - Required from HMC as soon as improved parts are available.
- **TSB:**
 - HMC should provide a TSB with the improved parts.
- **Other comment:**
 - As the stop lamp switch also provides input to auto shift release, sometimes customers complain that the shifter cannot be released from the PARK position.

Subject* e.g. [A] SUBJECT – EARLY WARNING/PORT ISSUE – HMMA/HMC				
[B] BRAKE SWITCH NO CONTINUITY – EARLY WARNING - HMC				

1. Condition:

Customer complains of brake lights stuck on.

Repair Date: 5/15/06

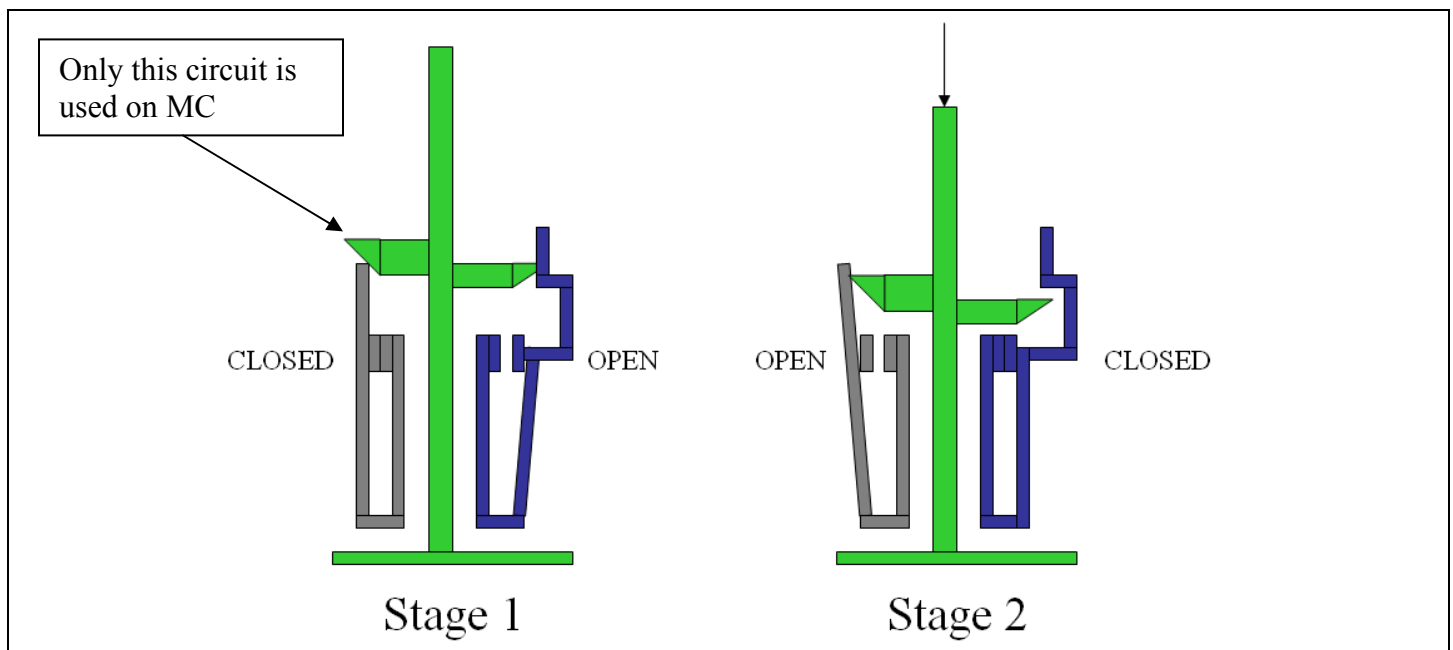

Op Code: 93810R00

Part #: 93810-38110

2. Analysis:

HMA has received 3 brake switches. 4 have been replaced under warranty. All three exhibited the same conditions.

This switch is common with NF and TG. The switch consists of 2 circuits; the MC only utilizes one circuit because MC does not have cruise control. The circuit consists of two contacts, either will complete the circuit. As the plunger is depressed by the brake pedal it displaced the brake light circuit. When the brake pedal is released the circuit is completed.

The stamping process appears to be bending the switch so that only one contact is touching when the brake pedal is not applied. The current level could be too high for the single contact. All 3 switches exhibited excessive heat on the same contact.

Lot codes, part number and manufacturer.

PHOTO.32

Diagram illustrating the E39 Stop Lamp Switch circuit. The circuit starts with a power source (HOT AT ALL TIMES) connected to the MP JUNCTION BOX (PHOTO 26). The power flows through a STOP LP 15A fuse to the E39 Stop Lamp Switch (PHOTO 32). The switch is connected to the MP-F (10) and MP-E (2) terminals. The circuit then branches into four paths:

- Left Path:** Connects to the PCM (PHOTO 22) via C01-1 (PHOTO 62).
- Second Path:** Connects to the REAR COMBINATION LAMP LH (PHOTO 68) via F17 (PHOTO 62).
- Third Path:** Connects to the REAR COMBINATION LAMP RH (PHOTO 69) via F16 (PHOTO 63).
- Right Path:** Connects to the HIGH-MOUNTED STOP LAMP (PHOTO 67) via F20 (PHOTO 62) and the HIGH-MOUNTED STOP LAMP (PHOTO 73) via R03 (PHOTO 74).

The diagram also shows the E28 Ignition Lock Switch (PHOTO 32) and the ABS Control Module (PHOTO 15) connected to the circuit.

93810-3K000	02/28/2008	15500	C29

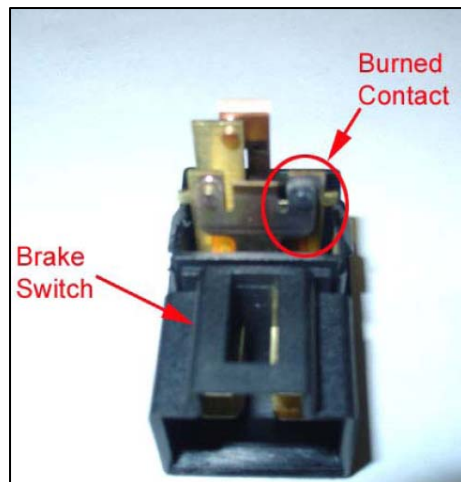

1. Issue Description

- Customer complains ESC light ON.
- Technician confirmed poor G32 ground.

2. Part Analysis

- Test vehicle was obtained to review assembly of related components
- Brake Switch from incident vehicle exhibited damaged contact points.

3. Data Analysis

- Data analysis reveal 77 claims during 09NF production.
- Latest claims include ESC light on comments.

[illegible]

VIN Number	Prod Date	Mileage	Technician Comment
5NPET46C59H	10/10/08	753	CUST STATES ESC LITE WON'T TURN OFF. SCAMMED FOUND CODES C1513 BRAKE LAMP SWITCH INSPECTED SWITCH FOR PROPER ADJUSTMENT INTERNAL FAILURE

Subject* e.g. [A] SUBJECT – EARLY WARNING/PORT ISSUE – HMMA/HMC					
[B] BRAKE SWITCH FAILURE – HMMA					
<input checked="" type="checkbox"/> Photo <input checked="" type="checkbox"/> Part <input type="checkbox"/> Other					

1. Condition:

Customer complains of brake lights stuck on. 12 incident switches collected.

Repair Date: 5/18/06

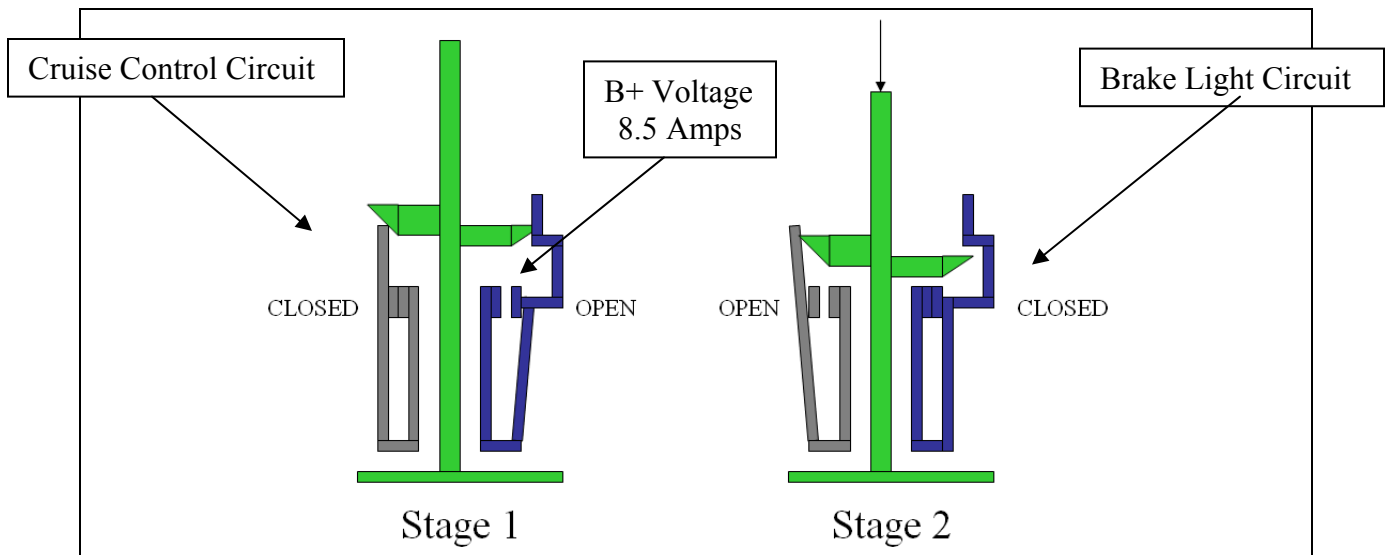

Op Code: 93810R00

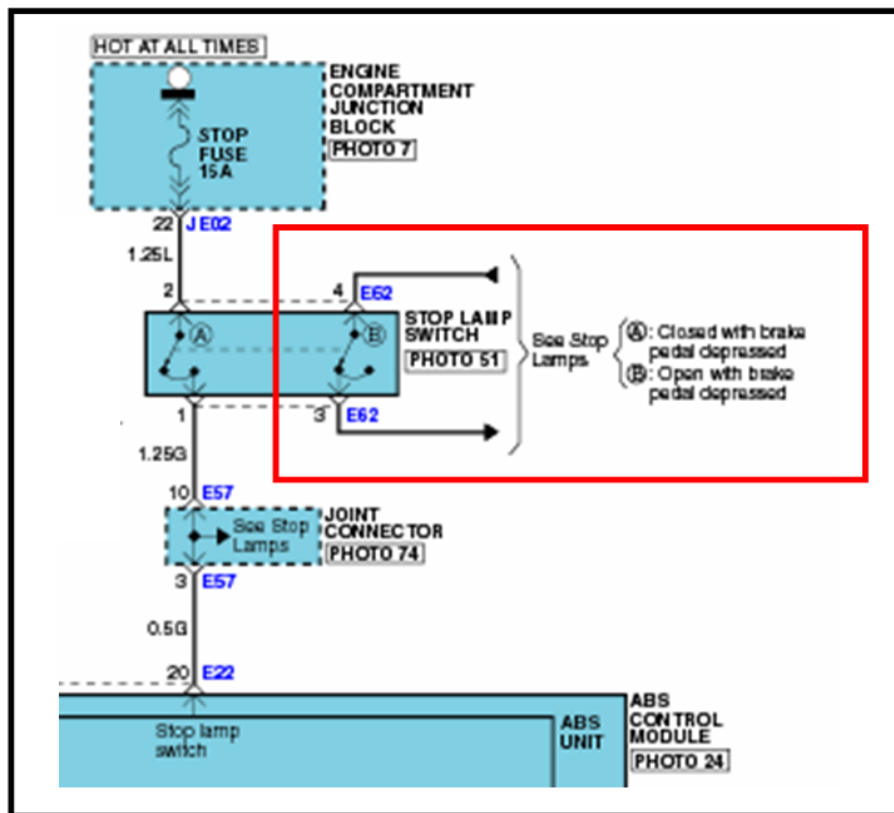

Part #: 93810-3K000

TSB 06-50-006 was written to help dealers properly diagnose stop lamp switch issues.

2. Analysis:

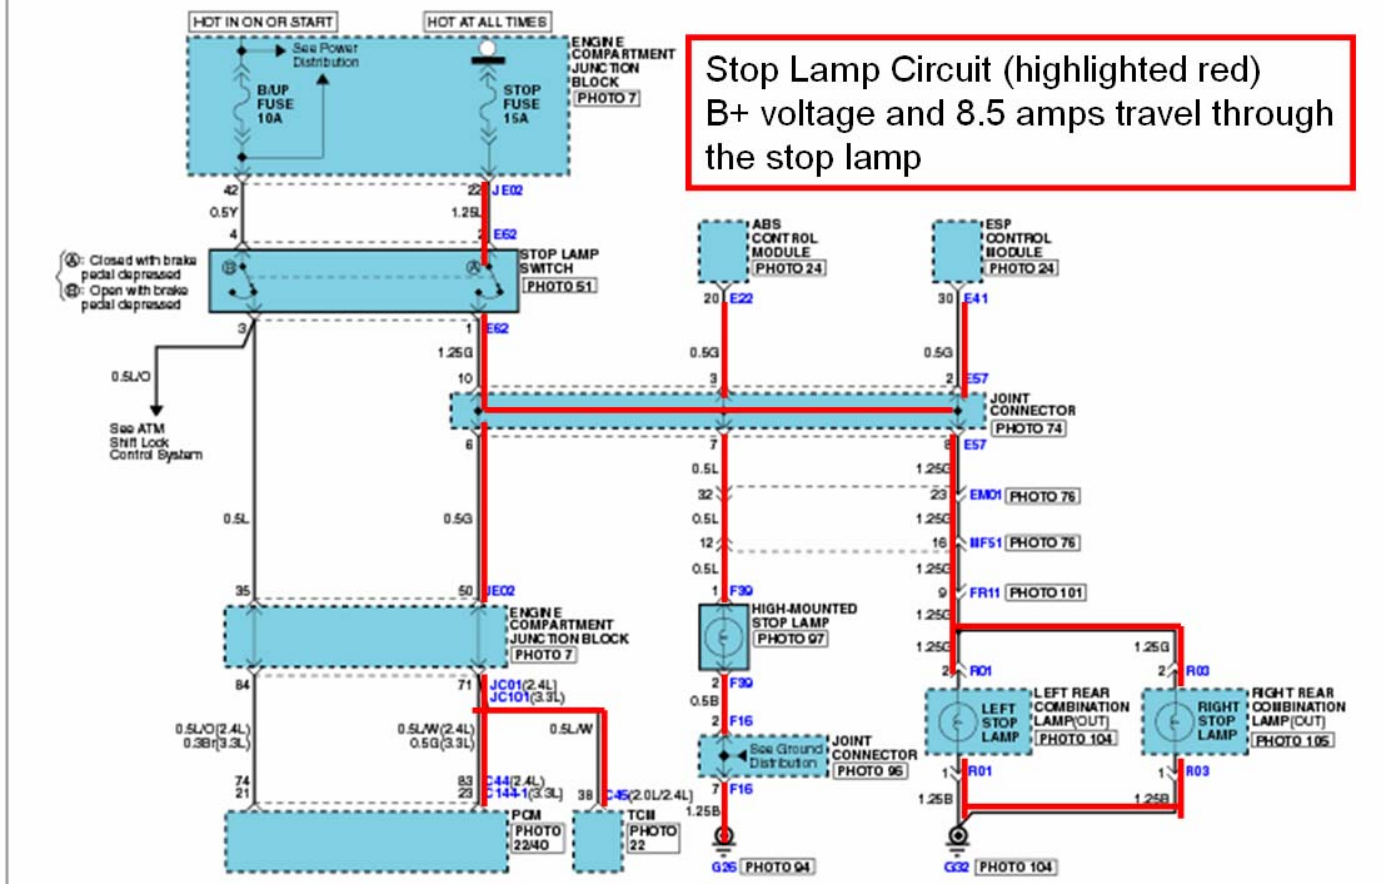

This switch is common with MC and TG. The switch consists of 2 circuits, one each for stop lamps and cruise control. The stop lamp circuit consists of two contacts. A connection at either contact will complete the circuit. When the brake is depressed a plunger allows the cruise control circuit to disconnect and connects the stop lamp circuit. When the brake pedal is released the plunger allows the cruise control circuit to connect and disconnects the stop lamp circuit.

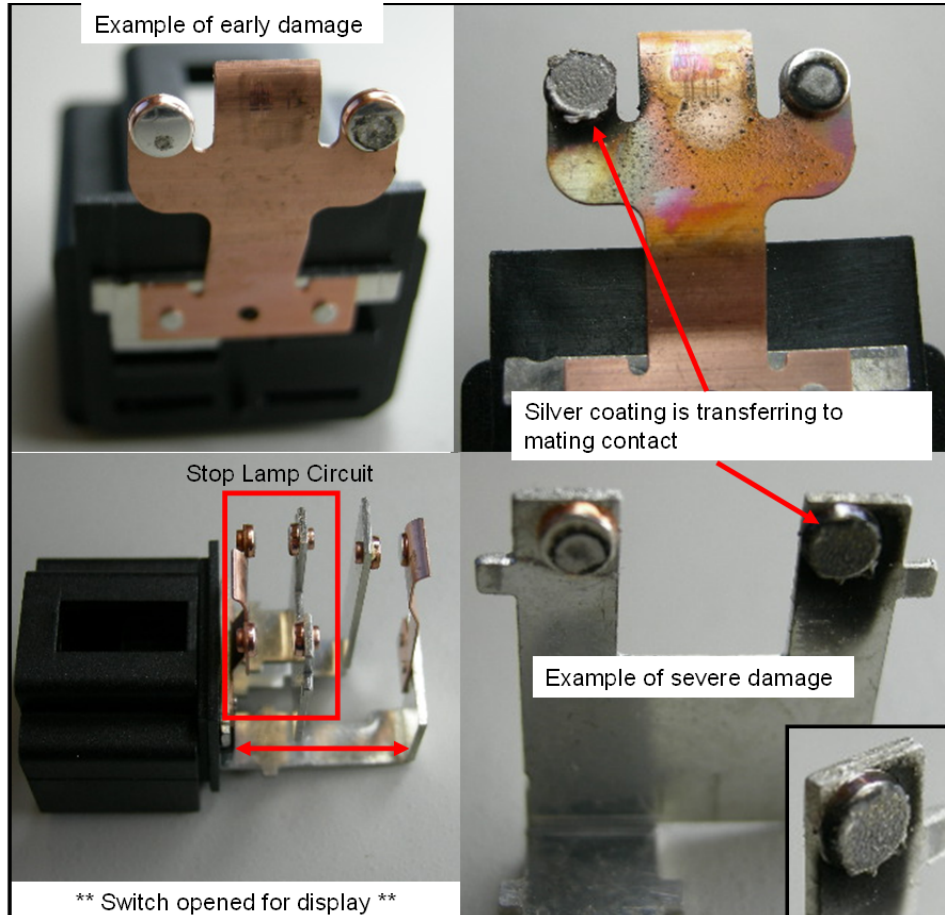

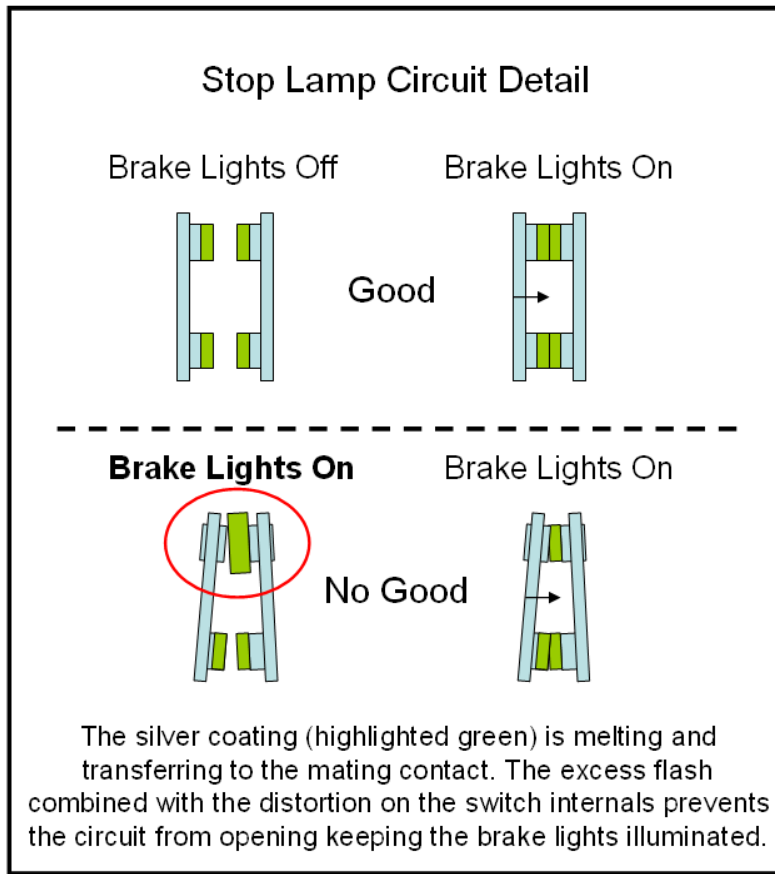

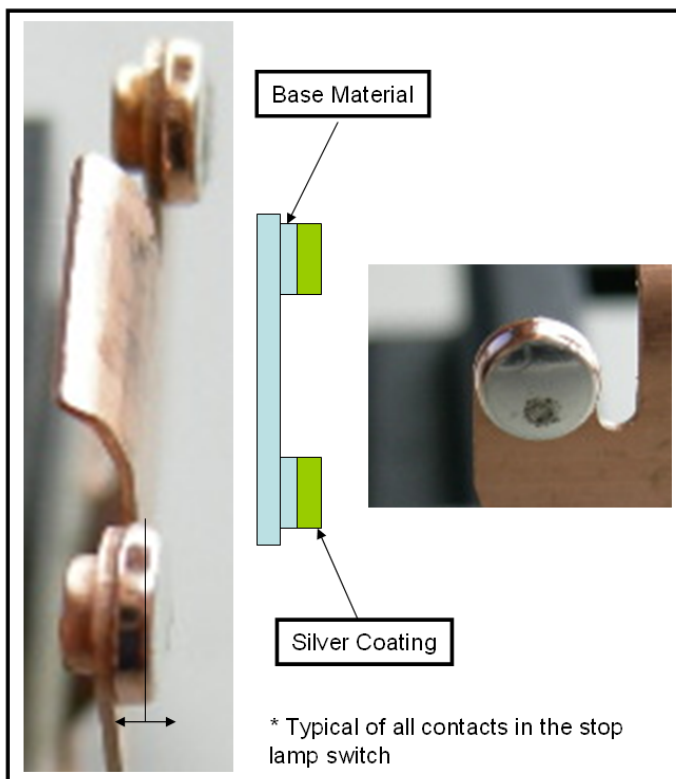

STOP LAMPS (1)

SD927-1

- The contacts consist of a base conductive material and a silver coating at the contact point. The incident switches indicate that the silver contact material is overheating and transferring onto the mating contact.

Silver coating is transferring to the mating contact. Flash from the transfer and distortion in the switch internals allows only one contact to complete the circuit which creates additional heat.

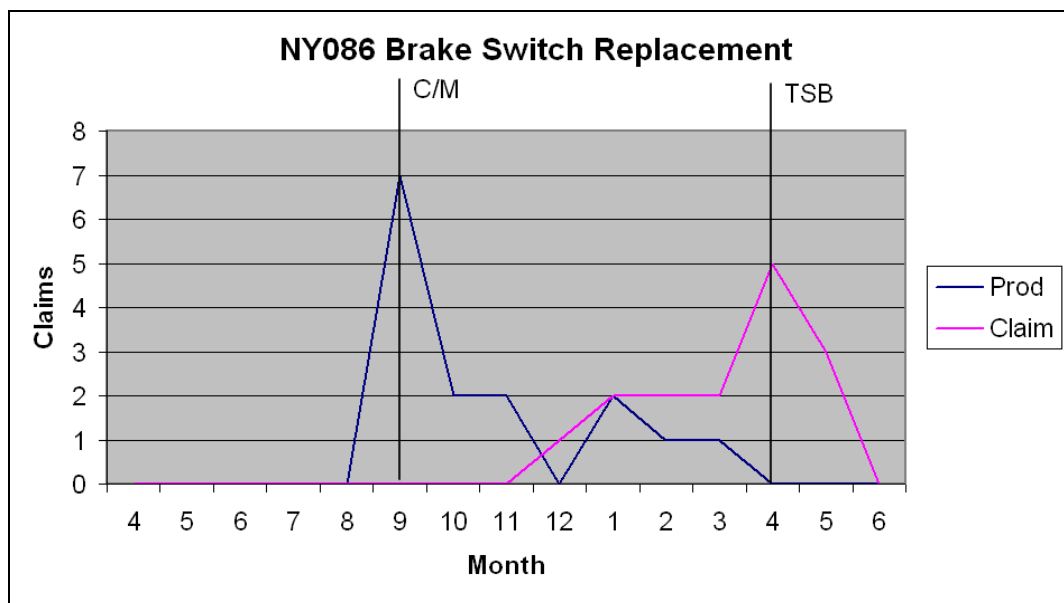

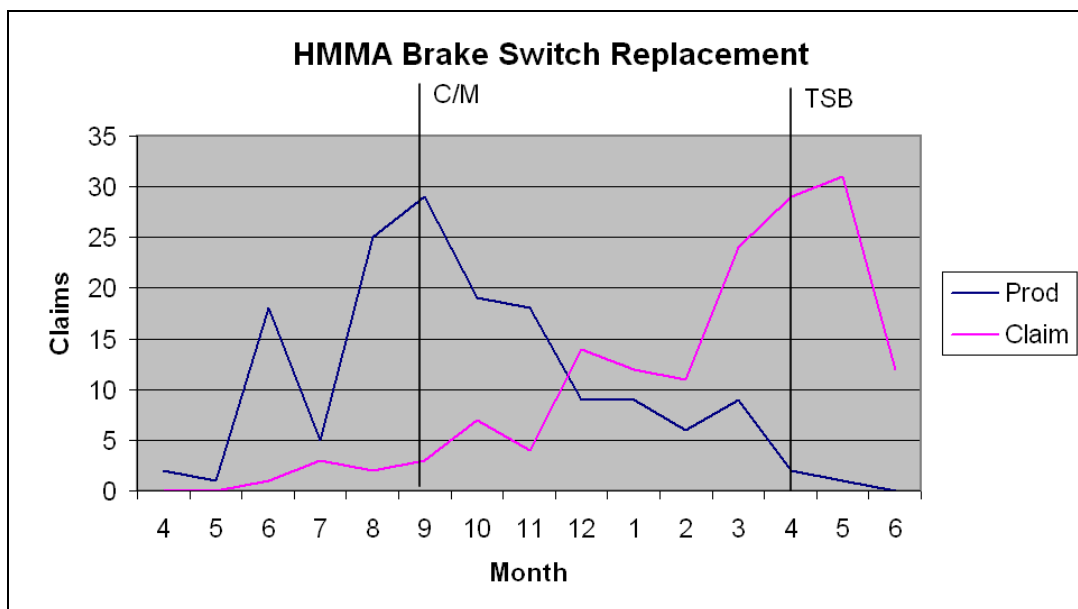

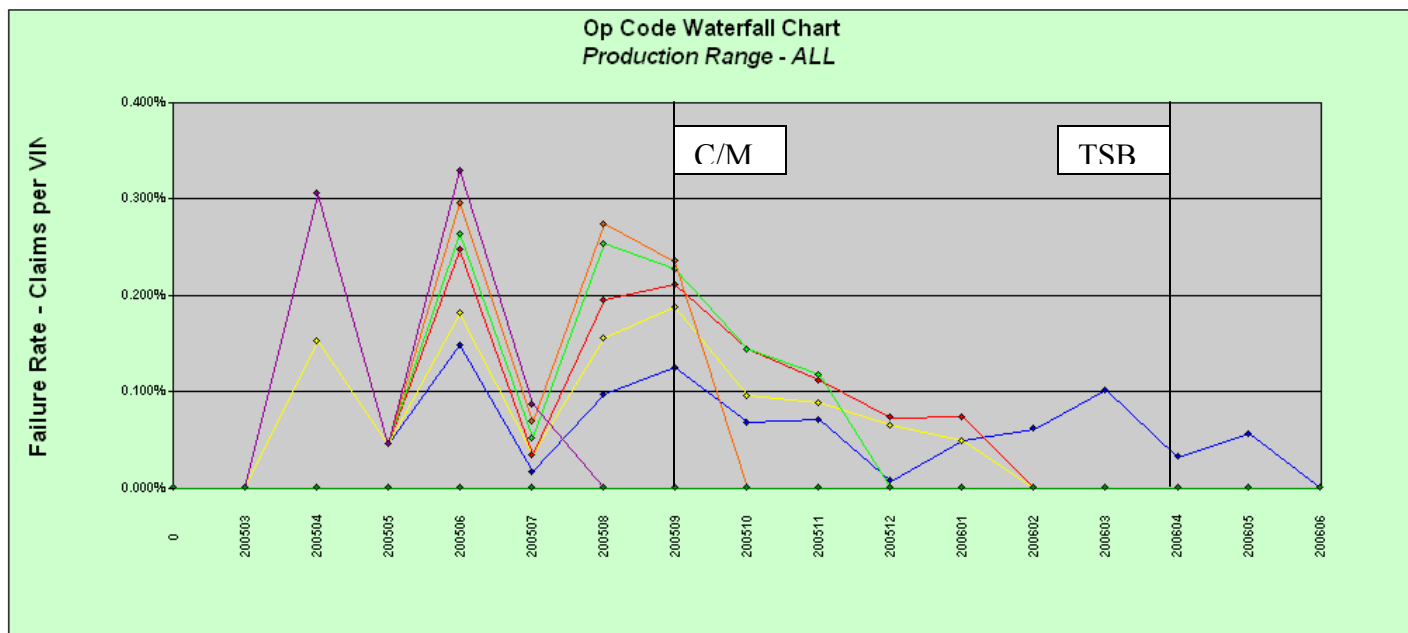

Warranty Analysis:

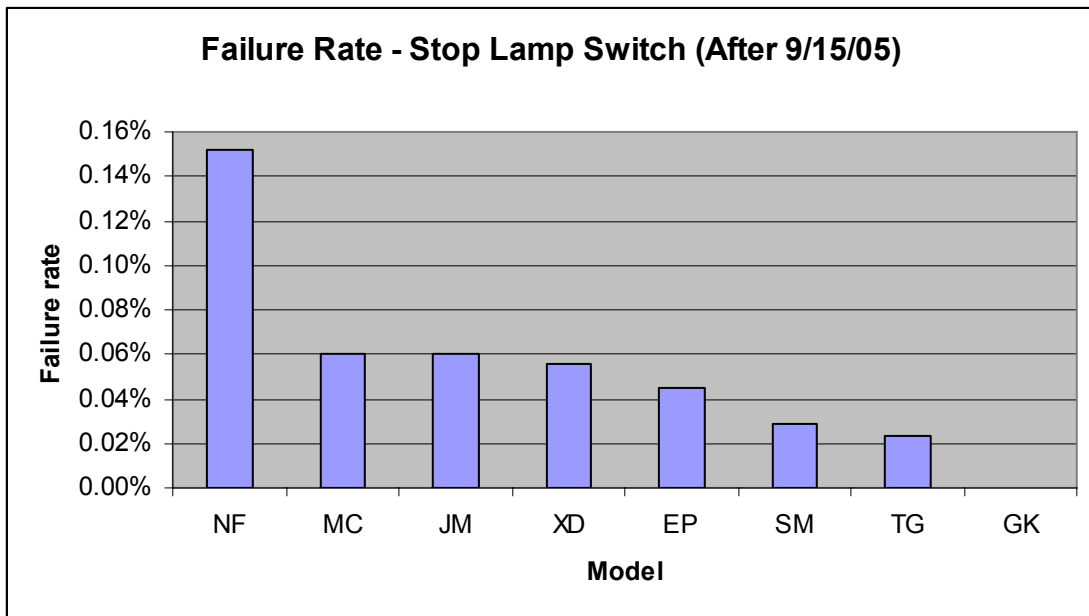

- HMC C/M changed stop lamp switch suppliers on 9/19/2005.
 - New supplier as of 9/19/05, confirmed on 9/21 P/D
 - Changed the Brake pedal switch's Vendor & contact point type.
 - H.K FCI (up & down type) INPAC (Sliding type).
 - Effective date : Apr.28.05 (Asan plant), Aug.19.05 (HMMA)
- 54 warranty claims after 10/1/2006 production date as of June 20th, 2006. (46 parts replaced)
- Average Months in Service: 1.8
- Average miles: 3,057
- No regional effects:

Region	Claims

AL 2		CO031	1

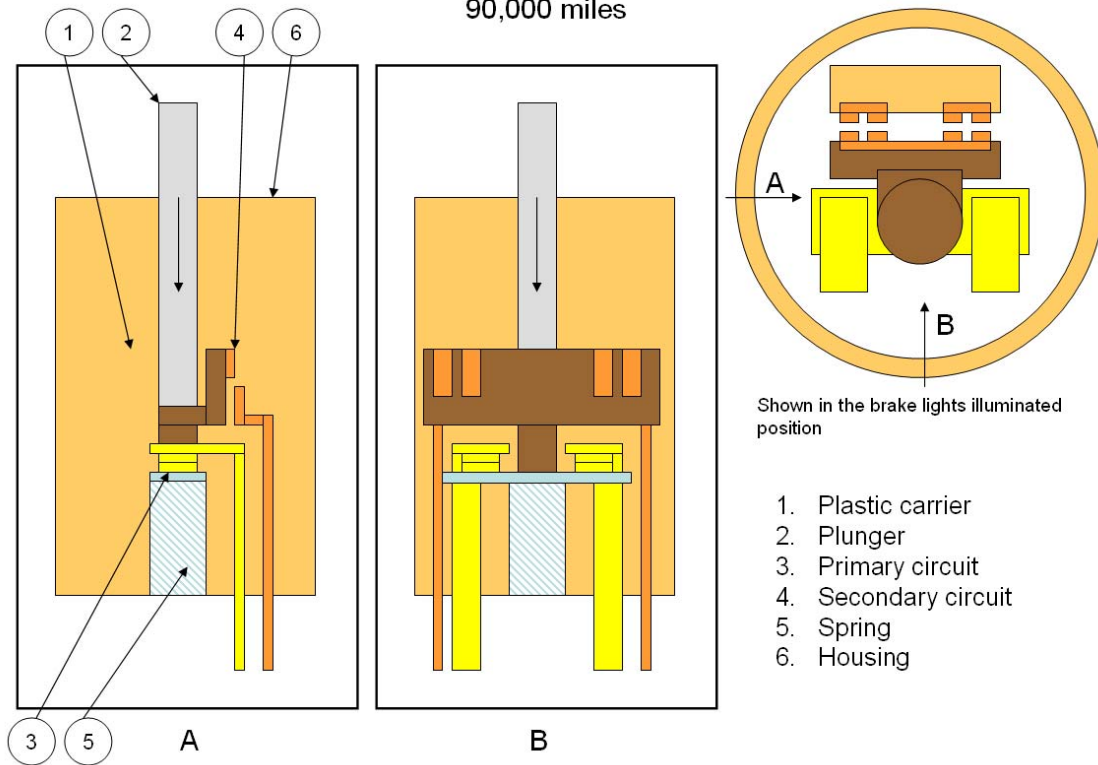

* NF, MC, JM and TG all use a common stop lamp switch (93810-3K000, 93810-38110 on MC)

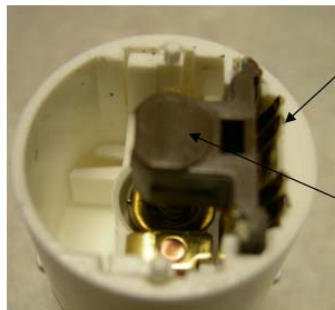

Competitive Vehicle Analysis:

HMA looked at two high mileage vehicles for comparison, the Honda CRV and Toyota Corolla.

Toyota Corolla
90,000 miles

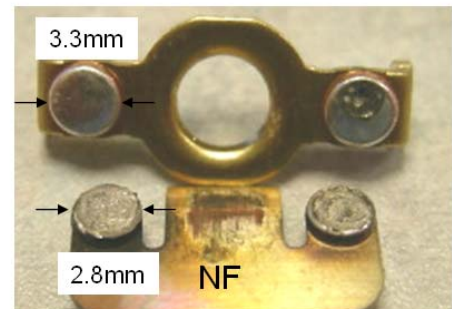

Toyota Corolla
90,000 miles

Secondary circuit

Plunger strikes the carrier which then compresses the spring and opens the primary circuit.

Primary circuit is a self contained unit within the switch housing

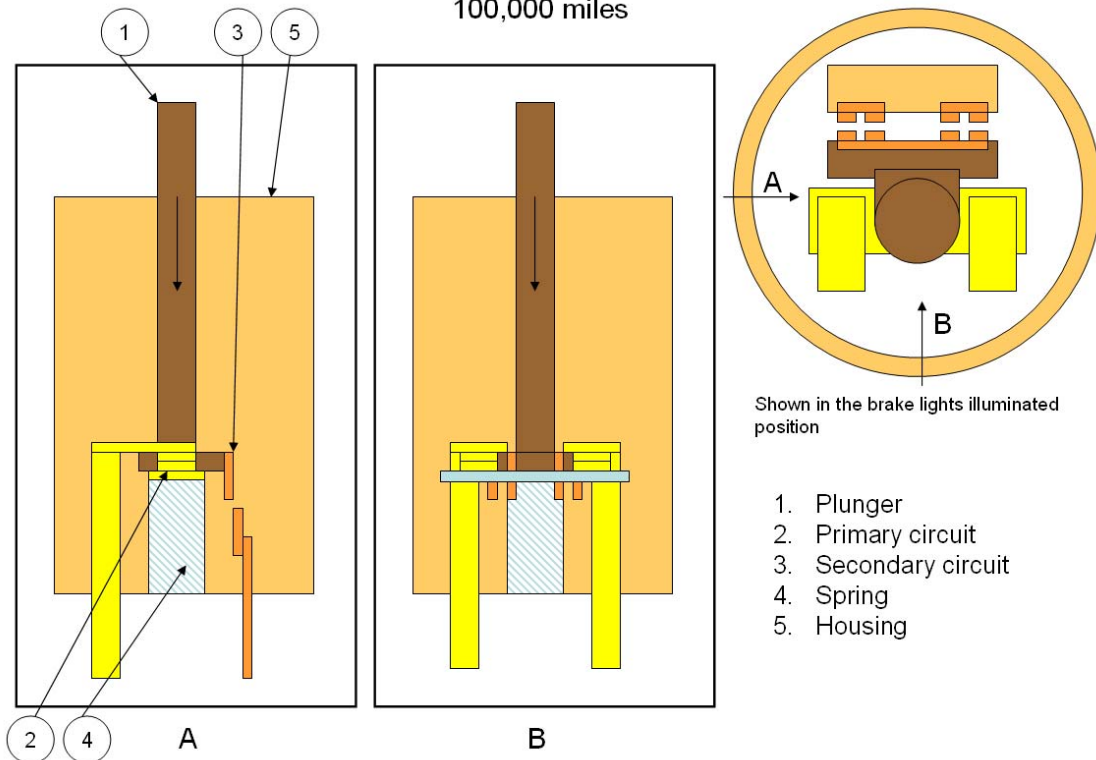

Primary circuit contacts are smooth and coated similar to NF. Signs of heat and metal transfer similar to NF.

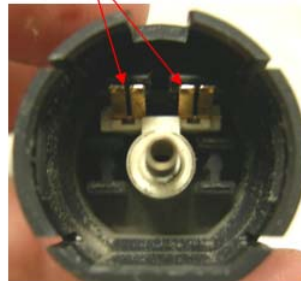

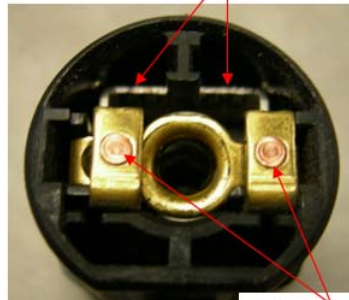

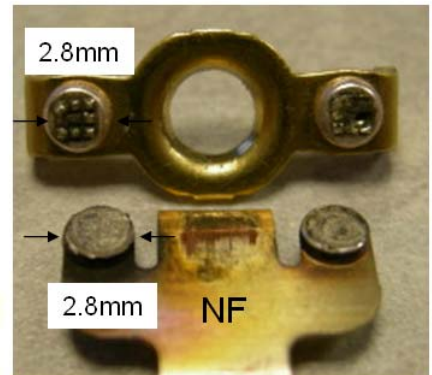

Secondary circuit

Honda CRV
100,000 miles

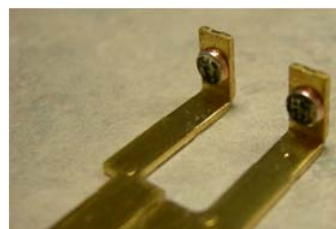

Honda CRV
100,000 miles

Switch has very limited damage after 100k miles.

Primary circuit spring side contacts have 6 small stamped protrusions.

Primary circuit fixed contacts are smooth with coatings similar to NF.

Secondary circuit slides with the plunger.

3. Action:

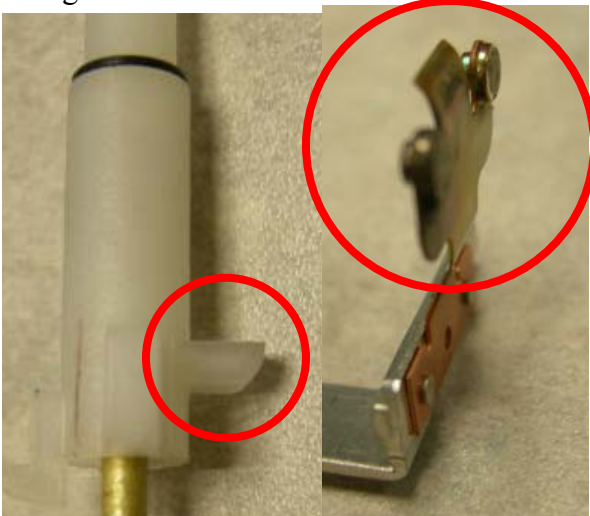

Dealer – Replace switch, adjust using TSB: 06-50-006.

4. Comment/Recommendation:

HMA requests that HMC/HMMA investigate this failure to determine if excessive current is being transmitted through the brake switch. Also HMC should determine if the design is robust enough for a single contact to carry all the current in the circuit without overheating.

HMC/HMMA should determine if the silver coating material is adequate to handle the heat load when a single contact occurs.

Also the ramp that allows the contacts to “make” does not allow for instantaneous contact which can promote extended arcing and excess heat. This system also allows a single contact to carry the load if a customer is riding the brakes.

[B] INTERMITTENT NO "PARK" RELEASE AND "ESC" LIGHT ON – HMMA (EARLY WARNING)				

1. Condition:

- The customer states that the transmission intermittently doesn't release from "PARK" and the "ESC OFF" light stays ON the dash (see vehicle drop off request attached below).

VEHICLE DROP OFF
Please leave key in envelope and fill out the information below:

VEHICLE:
 Model SONATA-V6 Color SILVER
 License # 6-AR-1234 Space # 6
 Date 5/14 Time _____

DRIVER:
 Name GEORGE GONZALEZ
 Extension 4802

I NEED ...
☐ 7,500 service ☐ 15,000 service
☐ 22,500 service ☐ 30,000 service
☐ other, describe: _____

1. ESC WILL NOT STAY ON
2. CHECK ENGINE LIGHT ON
3. HAD TO GET OUT OF PARK

↓

2. Analysis:

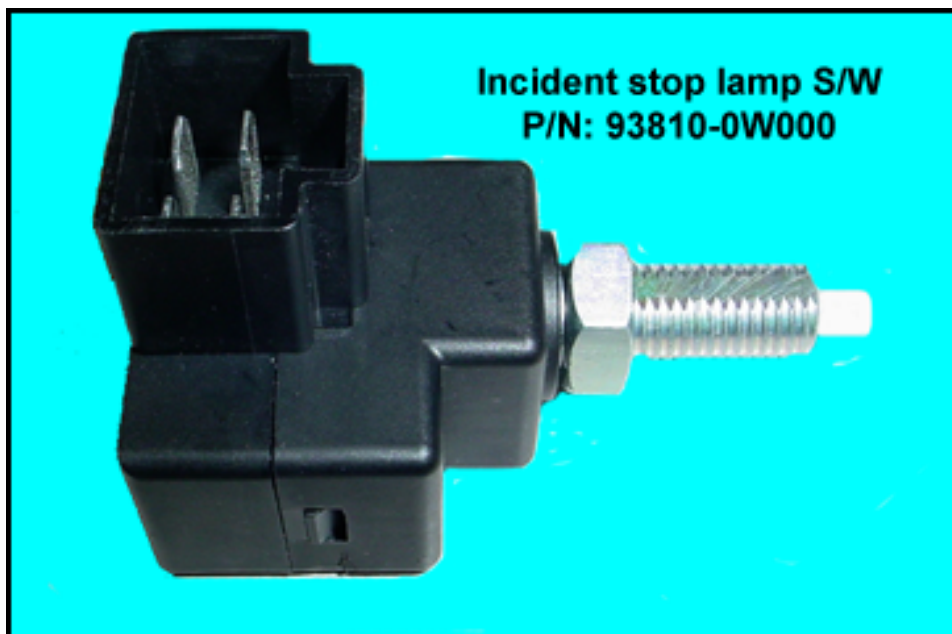

- The customer complaint was duplicated by driving the vehicle.
- While driving the vehicle, the following conditions were experienced intermittently:
 - The automatic transmission shifter could not be moved from “D” to any other gears at a stop light.
 - When this condition was experienced, the “ESC OFF” indicator light was turned ON the dash.
 - When the ignition key was cycled, the “ESC OFF” indicator light on the dash was turned OFF and the transmission started operating normally.
 - Additional driving of the vehicle showed that intermittently only the “ESC OFF” indicator light would turn ON the dash but the transmission would operate normally.
 - When the transmission shifter was stuck in “PARK”, the tail light lamps would not operate with the brake pedal depressed.
- The photo below shows the vehicle mileage and the “ESC OFF” indicator light ON when this condition was recreated.

- The HI-Scan captured the code C1513 (Brake lamp switch open/short).

- Replacing the stop lamp switch assembly, P/N: 93810-0W000, corrected this condition.
- The photo below shows the incident stop lamp switch, P/N: 93810-0W000.

- The incident stop lamp switch continuity checked out OK statically on a bench.
- HMA suspects that there may be internal electrical contact burned out condition that may have had cause this incident.
- The above comment is made based on a similar incident analyzed in detail in the QIR: QAEN-C-
- Please refer to this QIR for additional information attached herewith.
- The warranty shows that this is the only incident; however, HMA suspects that there will be more incidents based on the warranty on similar parts on other models.

3. Action:

Replace stop lamp switch, P/N: 93810-0W000.

4. Comment/Recommendation:

- HMMA should test the incident stop lamp switch in the vehicle to determine the cause(s) of this condition and apply corrections as necessary to improve this condition.
- HMA feels that the switch design, particularly switch contact size and shape may be an issue here.
- HMA has done many QIRs on this subject and subsequently HMC has applied many countermeasures; however, looking at the warranty data, it appears that the applied countermeasures have not been very effective. Therefore, HMMA and HMC should review the switch design and apply improvements such that they become less incident prone.

Condition:

Date: 05/18/2007

Report Number : QANF-C-070511

The customer states that the transmission intermittently doesn't release from "PARK" and the "ESC OFF" light stays ON the dash (see vehicle drop off request attached below).

Analysis:

Date: 05/18/2007

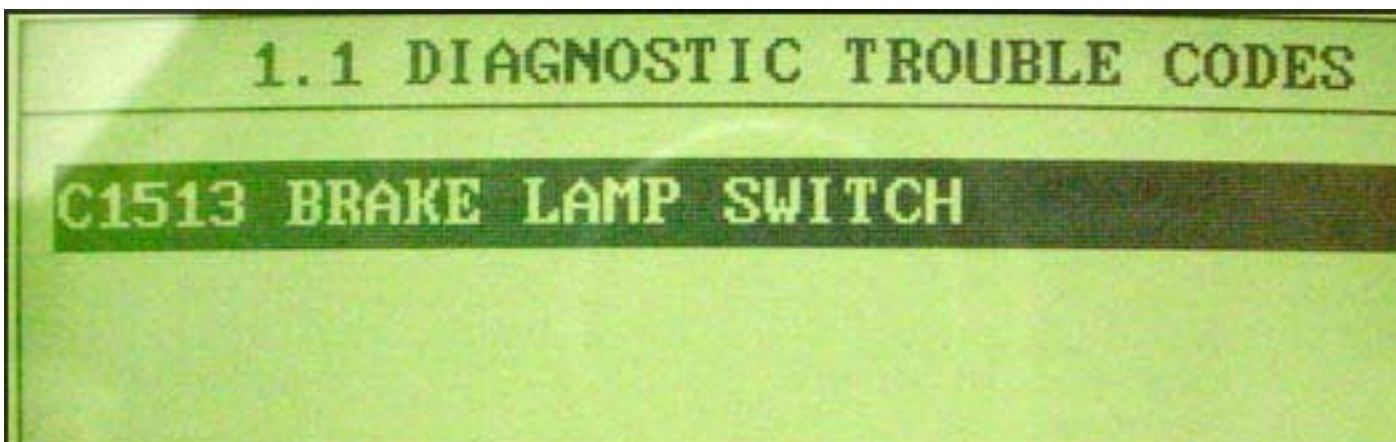

Report Number : QANF-C-070511

- The customer complaint was duplicated by driving the vehicle.
- While driving the vehicle, the following conditions were experienced intermittently:
 - The automatic transmission shifter could not be moved from "D" to any other gears at a stop light.
 - When this condition was experienced, the "ESC OFF" indicator light was turned ON the dash.

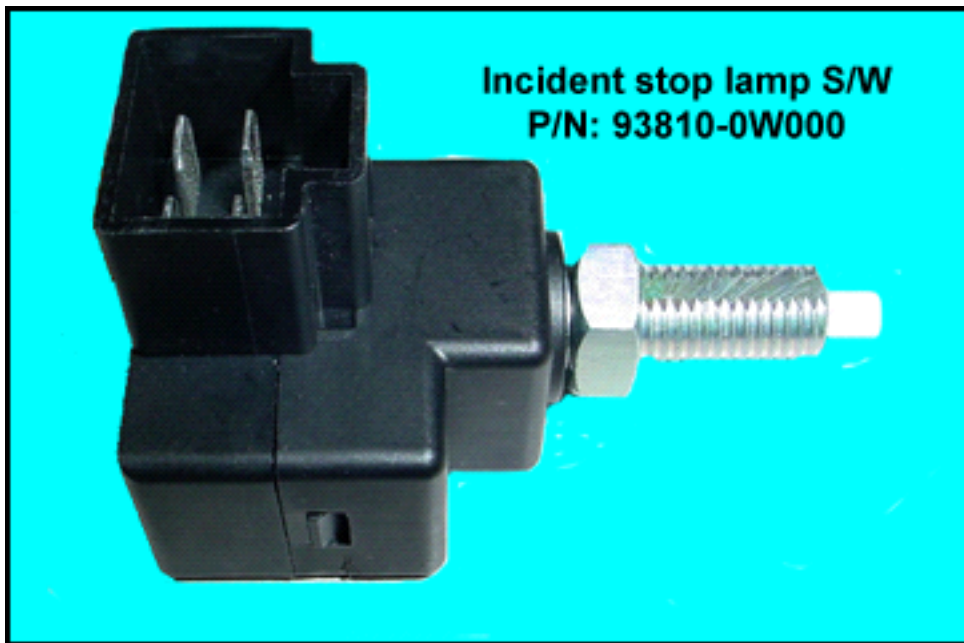

- When the ignition key was cycled, the “ESC OFF” indicator light on the dash was turned OFF and the transmission started operating normally.
- Additional driving of the vehicle showed that intermittently only the “ESC OFF” indicator light would turned ON the dash but the transmission would operate normally.
- When the transmission shifter was stuck in “PARK”, the tail light lamps would not operate with the brake pedal depressed.

- The photo below shows the vehicle mileage and the “ESC OFF” indicator light ON when this condition was recreated.

- The HI-Scan captured the code C1513 (Brake lamp switch open/short).
- Replacing the stop lamp switch assembly, P/N: 93810-0W000, corrected this condition.
- The photo below shows the incident stop lamp switch, P/N: 93810-0W000.

- The incident stop lamp switch continuity checked out OK statically on a bench.
- HMA suspects that there may be internal electrical contact burned out condition that may have had cause this incident.
- The above comment is made based on a similar incident analyzed in detail in the QIR: QAEN-C-
- Please refer to this QIR for additional information attached herewith.
- The warranty shows that this is the only incident; however, HMA suspects that there will be more incidents based on the warranty on similar parts on other models.

Corrective Action:

Date: 05/18/2007

Report Number : QANF-C-070511

Replace stop lamp switch, P/N: 93810-0W000.

Comments and Recommendations:

Date: 05/18/2007

Report Number : QANF-C-070511

- HMMA should test the incident stop lamp switch in the vehicle to determine the cause(s) of this condition and apply corrections as necessary to improve this condition.
- HMA feels that the switch design, particularly switch contact size and shape may be an issue here.
- HMA has done many QIRs on this subject and subsequently HMC has applied many countermeasures; however, looking at the warranty data, it appears that the applied countermeasures have not been very effective. Therefore, HMMA and HMC should review the switch design and apply improvements such that they become less incident prone.

(A) INOPERATIVE BRAKE STOP LAMP SWITCH CAUSES NO ATM SHIFTER RELEASE-HMMA					
Attachments <input checked="" type="checkbox"/> Photo <input checked="" type="checkbox"/> Part <input type="checkbox"/> Other					

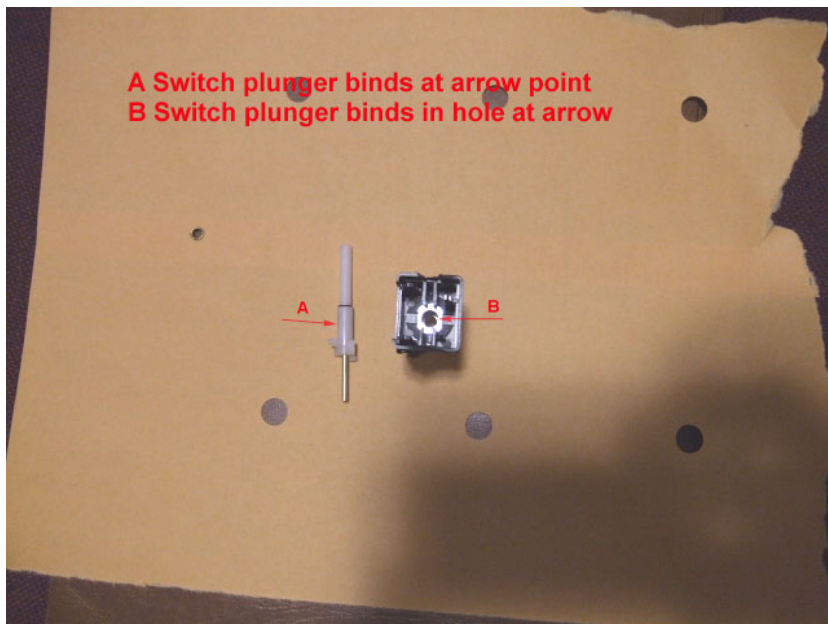

Condition:

The Transaxle cannot be shifted out of Park.

Analysis:

Investigation revealed the brake stop light switch plunger is sticking in the brake switch. When the brake pedal is depressed the plunger will not move out of the brake switch. The shifter release solenoid is not activated thus preventing the shifter from being released from Park.

One switch was disassembled. The switch plunger at it's widest diameter (A in photo) binds in the hole (B in photo).

Additional vehicles with the same condition.

<u>VIN:</u>	<u>Production Date</u>
5NPEU46F67H	11/11/06
5NPEU46F07H	11/20/06
5NPEU46FX7H	11/20/06
5NPEU46F37H	11/15/06

Corrective Action:

Replace the brake light switch p/n 93810-3K000

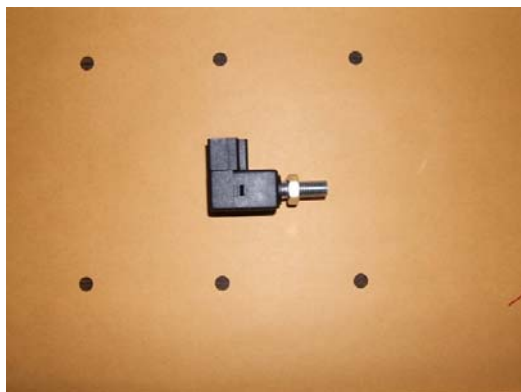

Recommendation:

HMMA should investigate the cause of the brake switch malfunction and implement changes needed to eliminate the condition. The inability of the driver to remove the Transaxle from Park will probably cause the vehicle to be towed to a repair facility.
