1 SCOPE. These specifications cover basic requirements for electroplated parts of the copper-nickel-chromium type as used on steel, zinc die cast, copper based alloys, and plastic components, and wrought, die-cast or forged aluminum and aluminum alloys, excluding wheels.

1.1 GM4372M and GM4374M are intended for exterior parts and provide 2 levels of corrosion protection. GM4374M provides corrosion protection for severe service conditions that include likely damage from denting, scratching and abrasive wear in addition to corrosive environments such as encountered by automotive bumpers and related components. This specification differs from GM4372M in that it requires a longer corrosion (CASS) exposure. GM4372M provides corrosion protection for corrosive environments which receive little additional mechanical abuse. Both specifications require the use of discontinuous chromium plate in addition to a multiple layer nickel system.

1.2 GM4373M is intended for interior applications. It does not require the use of discontinuous chromium or multiple layer nickel systems.

1.3 When specifying chromium plating on aluminum, a coating must be applied to all of the non-significant surfaces which do not receive a full complement of plate and are exposed to severe corrosive environments. Aluminized wax or other corrosion protective coatings are recommended.

2 REFERENCED STANDARDS.

GM4260P ASTM B456 ASTM B764
GM9071P ASTM B487
ASTM B368 ASTM B571

3 REQUIREMENTS.

3.1 PLATING THICKNESS. Shall be determined by the microscopic method (ASTM B487) or the electrochemical method of GM4260P. In case of disagreements between purchaser and supplier, the microscopic method shall be the preferred method.

3.1.1 Minimum plate thickness as specified in Table 1 is intended to apply to all low current density and high current density areas of significant surfaces as specified on appropriate part drawings or as otherwise agreed upon between purchaser and supplier. Such surfaces are those normally visible - directly or by reflection - on the finished part when assembled in car position, or which can be the source of corrosion deposits that deface visible surfaces on the assembled vehicles.

3.1.2 The multiple layer nickel thickness consisting of at least 2 layers of electro-deposited nickel shall be a minimum of 60% semibright nickel, except when high activity nickel strike is used between the semibright and bright nickel layers, then the semibright thickness shall be a minimum of 40%.

3.1.3 Minimum thickness and corrosion resistance performance requirements for textured finishes (matte, vapor blast, brush, etc.) apply after texturing.

3.1.4 Exceptions to the minimum plating thickness are generally shown as a detail on the part drawing by either designating plating checkpoint(s) or by indicating in an appropriate view the area(s) with deviated thickness(es) allowed. These exceptions must still meet the specified number of corrosion test hours.

3.2 NICKEL ELECTROCHEMICAL POTENTIAL (GM4372M AND GM4374M ONLY). Determine potential difference following ASTM B764.

3.2.1 The bright nickel layer shall exhibit an anodic electrochemical potential difference of 100 mV minimum to semibright nickel on all significant surfaces. Conformance to this requirement shall be determined with 99% confidence (3 sigma) using appropriate statistical charting techniques on a routine quality control basis.

3.2.2 The maximum electrochemical potential difference between the microparticulate nickel layer and the bright nickel on all significant surfaces of all substrates is 20 mV.

3.3 DISCONTINUOUS CHROMIUM. Shall be performed by either the copper deposition (Dubpennell) method or by the determination of active corrosion sites after corrosion testing. Both are described in the appendix of ASTM B456. In the case of an active sites determination, compare the viewed sample at 100X to the pore density charts shown in Appendix A of this specification to determine pore count.

3.3.1 The microdiscontinuous chromium surface shall exhibit a minimum of 10 000 pores/cm² as determined by copper deposition or 2000 pores/cm² as determined by active sites.

3.4 CORROSION RESISTANCE. Shall be determined by the CASS test, ASTM B368, according to the number of hours specified in Table 1.

3.4.1 Plated components shall be free of corrosion on all significant surfaces when examined at normal reading distance with the unaided eye and uniform diffused light.

3.5 ADHESION. Plated metallic components shall be subjected to the Saw-Grind Test, ASTM B571, with no evidence of lifting or peeling either between plated layers or the plate and the substrate.

3.5.1 Plated plastic parts shall be subject to the thermal cycling test described below. At the conclusion of the test sequence the plated part shall show no deformation, crazing, blistering, splitting, or loss of adhesion to the substrate or loss of adhesion between individual layers of the plated metal.

DECORATIVE CHROMIUM PLATING - COPPER, NICKEL, CHROMIUM TYPE
GM4372M GM4373M GM4374M

3.5.2 The thermal cycling test shall be performed as follows:

(a) When corrosion test is specified, expose part for 22 h minimum CASS prior to Step (b). When corrosion test is not required, completely immerse part in water maintained at 38 ± 1.5°C for 22 h prior to Step (b).
(b) Mount part in a restrained position simulating in service usage. One hour maximum is allowed between end of Step (a) and start of Step (c).
(c) Expose part for 1 h min at -30 ± 1.5°C.
(d) Expose part for 15 minutes minimum at 25 ± 5°C.
(e) Expose part for 1 h min in an air circulating oven at 85 ± 1.5°C.
(f) Expose part for 15 minutes minimum at 25 ± 5°C.
(g) Steps (c) thru (f) constitute 1 thermal cycle. Repeat Steps (c) thru (f) 3 additional times for a total of 4 cycles. Examine part per the requirements in 3.5.2 after each cycle.
(h) For parts not completely enveloped with electroplate, following the fourth cycle, scribe an X through the plating at the stop off demarcation into the basic material; place pressure sensitive adhesion tape, as described in GM9071P, approximately 20 mm wide over the X (leaving sufficient length of tape to grasp between fingers for quick removal); quickly pull tape at approximately 90 degrees to the surface of part to remove entire strip. Examine for evidence of lifting of electroplate.

5 INITIAL SOURCE APPROVAL. No shipment shall be made by any supplier until representative initial production samples have been approved by engineering as meeting the requirements of this specification.

5.1 Completed copies of the GM Material Safety Data Sheet and Critical Material Register (available from the engineering department or laboratory), or equivalent, must be submitted with any new submissions or where a composition change has occurred.

6 INSPECTION AND REJECTION. All shipments of material or parts under contract or purchase order manufactured to this specification shall be equivalent in every respect to the initial samples approved by engineering. There shall be no changes in either formulation or manufacturing processes permitted without prior notification and approval by engineering. Lack of notification by the supplier constitutes grounds for rejection of any shipment. While samples may be taken from incoming shipments and checked for conformance to this specification, the supplier shall accept the responsibility for incoming shipments meeting this specification without dependence upon purchaser’s inspection.

7 APPROVED SOURCES. Engineering qualification of an approved source is required for this specification. Only sources listed in the GM Corporate Materials File under this specification number have been qualified by engineering as meeting the requirements of this specification. Sources are available through the on-line MATSPC System.

8 GENERAL INFORMATION. This standard was first issued in September 1962. The latest revisions include:

**NOTE 1:** For nonwear interior parts, minimum chromium thickness may be 0.13 µm, if authorized by purchaser. Approval is indicated by addition of symbol (B) to the specification number, e.g. "GM4373M(B)."

**NOTE 2:** Copper may be used but not required. If not used at supplier option, then nickel must be used to meet the total plate thickness requirement. When copper is not used when plating steel substrates to GM4372M or GM4374M requirements, the total minimum thickness is reduced to 30 µm.

**NOTE 3:** Chromium thickness should be limited to 0.4 µm to preclude overlaying the microparticulate nickel pores if used. The use of chromium deposits from trivalent chromium baths is not permitted unless otherwise specified on the detail drawing.

**NOTE 4:** Tin Cobalt alloy may be used in lieu of chromium when symbol (K) is added to the specification number, e.g. "GM4373M(K)."

**NOTE 5:** For cloisonné type substrates, copper is optional.

**NOTE 6:** Suitable pretreatment processes must be developed for each type of alloy and processes of manufacture of the alloy. All pretreatment of aluminum processes must pass all visual adhesion and corrosion resistance properties as specified prior to production on each type of alloy and each type of manufacturing process of aluminum.

**NOTE 7:** All plated components must receive an aluminized wax or other corrosion-resistant coating on nonsignificant surfaces unless otherwise specified on the drawing.
DECORATIVE CHROMIUM PLATING - COPPER, NICKEL, CHROMIUM TYPE
GM4372M GM4373M GM4374M

APPENDIX A
APPENDIX - PORE DENSITY CHARTS (1mm BY 1mm)
1 Scope
This specification covers the evaluation method for determining the acceptability of parting lines on interior trim, visible or customer contact plastic parts.

Note: Nothing in this test method supersedes applicable laws and regulations unless a specific exemption has been obtained.

Note: In the event of a conflict between the English and domestic language, the English language shall take precedence.

2 References
Note: Only the latest approved standards are applicable unless otherwise specified.

2.1 External Standards/Specifications.
None.

2.2 GM Standards/Specifications.
None.

2.3 Additional References.
Boundary Sample Process, www.supplypower.com
NAO 4425, Styling Verification Form, Interior Department

3 Test Equipment
Digital Calipers / Feeler Gages
Silver paint

4 Test Material
Production tooled finished molded parts shall be evaluated.

Approvals to grain cavities evaluations are based on injection-molded parts from production tooling not based on reviews of tooling nor cold pour impressions from tooling.

5 Test Method

5.1 Summary of Test Method. Visually inspect interior trim, visible or customer contactable parts for parting line condition.

5.2 Test Sample Preparation. Production molded parts are painted silver by GM Interiors Dept.

5.3 Test Procedure. Parts should be viewed installed in a vehicle or buck. If a property is not available the part may be evaluated by holding it to approximate installed position.

6 Evaluation and Rating

6.1 Evaluate tool half mismatch, flash and texture location. See Figure 1.

6.2 On tactile parts no tool half mismatch is acceptable. Tactile surfaces examples are inside remote handles, knobs, switches and buttons.

6.3 Tool half mismatch less than or equal to 0.05mm or .002 in. is acceptable. Tool half mismatch greater than 0.05 mm or .002 in. is not acceptable.

6.4 Flash is not acceptable.

6.5 All parts must be texture free on both sides of the parting lines for a distance of 0.010 in.

6.6 The part submission and evaluation procedure is repeated until all issues are in agreement.

© Copyright 2003 General Motors Corporation All Rights Reserved

Figure 1: Parting Line and Tool Mismatch Requirements
7 Report
Approval of textured tool cavities and inserts based on reviews of production injection molded parts will be authorized on the Styling Verification Form (NAO 4425) issued by the Interior department. Boundary samples will be maintained as specified by the Supplier Quality departments Boundary Sample Process (www.supplypower.com).

8 Safety
This method may involve hazardous materials, operations and equipment. This method does not propose to address all the safety problems associated with its use. It is the responsibility of the user of this method to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

9 Coding system
This material specification shall be given in other documents, drawings, VTS, SST, SSTS, CTS etc. as follows:

1 Scope
This specification covers basic requirements for copper-nickel-chromium electroplated plastic parts, including assemblies.

1.1 Material Description. Platings to this specification are intended for interior (code A) and exterior (code B) application with two levels of corrosion protection. For exterior applications discontinuous chromium plate (microporous (mp) or microcracking (mc)) in addition to a multiple layer nickel system shall be used. Interior applications do not require the use of discontinuous chromium or multiple layer nickel systems. For interior application non discontinuous chrome (r) is permissible. Exterior plastics plated to this specification are further subdivided into application types: Type 1 which receives little or no stone chipping exposure on a vehicle, and Type 2 which is exposed to significant chipping. Type 2 includes significant surfaces of plated plastic parts attached to forward-facing vehicle areas or to vehicle areas subject to self-generated stone chipping (as defined by ≥ 15 degree impingement of straight line projection from tire). If no type is listed on detail drawing, Type 2 is assumed.

1.2 Symbols. Not applicable.

1.3 Typical Applications. This type of finish shall be principally used for decorative purpose. Bright and other (e.g., satin, brushed, grained) appearances for interior and exterior plastic applications, as defined by styling and specific appearance standards.

1.4 Remarks. Not applicable.

2 References
Note: Only the latest approved standards are applicable unless otherwise specified.

GMW3286 GMW14829

3 Requirements
3.1 Requirements on Delivery
3.1.1 Chemical Requirements. Not applicable.
3.1.2 Physical Requirements. Not applicable.

3.1.3 Mechanical Requirements.
3.1.3.1 Plating Thickness. Shall be determined by the microscopic method (ISO 1463) or the electrochemical method (ISO 2177), or by X-Ray method (ISO 3497). In case of disagreements between purchaser and supplier, the microscopic method shall be the preferred method.

3.1.3.1.1 Minimum plate thickness as specified in Summary Table, Table B1 is intended to apply to all low current density and high current density areas of significant surfaces as specified on appropriate part drawings or as otherwise agreed upon between purchaser and supplier (written statement). Such surfaces are those normally visible - directly or by reflection - on the finished part when assembled in car position, or which can be the source of corrosion deposits that deface visible surfaces on the assembled vehicles. If corrosion products are visible anywhere on a finished & dressed component in vehicle position, this specification is not met.

3.1.3.1.2 For systems with a total nickel layer thickness ≥ 20 microns, multiple layer nickel thickness consisting of at least 2 layers of electrodeposited nickel shall be as indicated in Table 1.

3.1.3.1.3 Exceptions to the minimum plating thickness are generally shown as a detail on the part drawing by either designating plating checkpoint(s) or by indicating in an appropriate view the area(s) with deviated thickness(es) allowed. These exceptions must still meet the specified number of corrosion test hours.
### Table 1: Nickel Thickness

<tr>
<td>Top (bright)</td>
<td>20 to 40%</td>
<td>≥ 30%</td>
</tr>
</tbody>
</table>

**Note 1:** If the total nickel layer thickness is < 20 microns, the semi bright thickness shall be 50% minimum.

3.1.3.1.4 Minimum thickness and corrosion resistance performance requirements for textured finishes (matte, vapor blast, brush, etc.) apply after texturing.

3.1.4 Additional Requirements.

3.1.4.1 Substrate / Molded Part.

3.1.4.1.1 Substrate type. Only for plating approved and designed substrates shall be used. Main types see Table 2.

#### Table 2: Substrate Types

</tr>
</tbody>
</table>

3.1.4.1.2 Substrate Structure. Parts shall demonstrate no defects like cracks or shrink holes. Parts shall be free of internal tension, which may influence adhesion or appearance of the galvanic coating.

3.1.4.1.3 Surface properties. The surface shall be smooth, free of flow lines, cracks, sink marks, craters or substrate separations, which may influence the appearance. Surface shall also contain no oil/fat or any human sweat from handling. In the tool no separation agents may be used, also parts may not be mechanically polished or sanded before plating.

3.2 Processing Requirements.

3.2.1 Chemical Requirements. Not applicable.

3.2.2 Physical Requirements. Not applicable.

3.2.3 Mechanical Requirements.

3.2.3.1 Nickel Electrochemical Potential (only exterior parts). Determination of potential difference following ASTM B764.

3.2.3.1.1 The bright (or satin) nickel layer shall exhibit an anodic electrochemical potential difference of 100 to 200 mV to semi bright nickel on all significant surfaces. The supplier must demonstrate the conformance to this requirement by using appropriate statistical charting techniques on a routine quality control basis.

3.2.3.1.2 The micro particulate nickel layer shall exhibit a cathodic electrochemical potential difference of 10 to 40 mV to the bright or satin nickel on all significant surfaces of all substrates.

3.2.3.1.3 If a micro cracking system is used, usually no microparticulate electrochemical potential difference is measurable.

3.2.3.1.4 The optional “high activity nickel strike” layer shall exhibit an anodic electrochemical potential difference of 15 to 40 mV to the bright nickel layer.

3.2.3.2 Discontinuous Chromium, shall be performed by either the copper deposition (Dubpernell) method or by the determination of active corrosion sites after corrosion testing. Both are described in the appendix of ASTM B456. In the case of an active sites determination, compare the viewed sample at 100X to the pore density charts shown in Appendix A of this specification to determine pore count.

3.2.3.2.1 Microporous System (mp). The microdiscontinuous chromium surface shall exhibit a minimum of 10 000 pores/cm$^2$ as determined by copper deposition or 2000 pores/cm$^2$ as determined by active sites per ASTM B456 Appendix X4 or X5.

3.2.3.2.2 Microcracking System (mc). The cracked chromium surface shall exhibit 250 to 800 cracks/cm and provide a closed homogenous network in all directions.

3.2.4 Additional Requirements. Not applicable.

3.3 Performance Requirements.

3.3.1 Chemical Requirements. Not applicable.

3.3.2 Physical Requirements.

3.3.2.1 Adhesion.

3.3.2.1.1 Saw Grind Test. Plated plastic components shall be subjected to the Saw-Grind Test, ASTM B571, with no evidence of lifting or peeling between plated layers. Place pressure sensitive adhesion tape, as described in GMW14829, approximately 10 to 20 mm wide over the cut edge (leaving sufficient length of tape to grasp between fingers for quick removal); quickly pull tape at approximately 90 degrees to the surface of part to remove entire strip. Examine for evidence of lifting of electroplate.
3.3.2.2 Temperature Storage. All parts shall be temperature tested for 6 ± 0.5 h. Temperatures see below. Test pieces shall show no surface changes, adhesion loss or other changes which reduce the performance and shall comply with specified drawing requirements after test.

3.3.2.2.1 If not defined separately all parts will be tested to the following temperature: +90 ± 3°C

3.3.2.2.2 For high temperature application areas e.g., engine compartment the substrate has to be selected to suit requirements. Test temperature: +110 ± 3°C. This must be indicated on the drawing.

3.3.2.3 Temperature Cycle. All plated plastic parts interior and exterior shall be subject to the thermal cycling test described below. At the conclusion of the test sequence the plated part shall show no deformation, crazing, blistering, splitting, or loss of adhesion to the substrate or loss of adhesion between individual layers of the metal plating layers.

3.3.2.3.1 Cycle A.

The thermal cycling test shall be performed as follows:

a. When corrosion test is specified, expose part for 24 ± 1 h CASS prior to Step (b). Note for LAAM non export vehicles only, it is optional to replace 24 ± 1 h CASS with 72 ± 1 h NSS. When corrosion test is not required, completely immerse part in water maintained at 38 ± 1.5°C for 22 h prior to Step (b).

b. Mount part in a restrained position simulating in service usage. One (1) h maximum is allowed between end of Step (a) and start of Step (c).

c. Expose part for 1 h min at -30 ± 1.5°C.

d. Expose part for 15 minutes minimum at 25 ± 5°C.

e. Expose part for 1 h minimum in an air circulating oven at 85 ± 1.5°C.

f. Expose part for 15 minutes minimum at 25 ± 5°C.

g. Steps (c) thru (f) constitute 1 thermal cycle. Repeat Steps (c) thru (f) 3 additional times for a total of 4 cycles. Examine part per the requirements in 3.3.2.3 for evidence of electroplate adhesion loss after each cycle.

h. After completion of thermal cycle step (g), expose part for 24 ± 1 h CASS. Note for LAAM non export vehicles only, it is optional to replace 24 ± 1 h CASS with 72 ± 1 h NSS.

i. For parts not completely enveloped with electroplate, following the fourth cycle, scribe an X through the plating at the stop demarcation into the basic material. Place pressure sensitive adhesion tape, as described in GMW14829 approximately 20 mm wide over the X (leaving sufficient length of tape to grasp between fingers for quick removal). Quickly pull tape at approximately 90 degrees to the surface of part to remove entire tape strip. Examine for evidence of lifting of electroplate.

3.3.2.3.2 Cycle B. The test piece shall be subjected 3 temperature cycles before the corrosion test one cycle consists of temperatures listed below.

a. 22 ± 1 h at +80 ± 3°C followed by
b. 2 h ± 10 minutes at -20 ± 3°C.

Immediately upon removal from the refrigerator test piece shall be subjected to one of the following impact tests:

Test pieces having a weight of ≤ 440 g shall be dropped in the cold condition from a height of ≈ 1 m onto a hard (stone-)floor.

Test pieces weighing > 440 g:

A ball of diameter 50 ± 1 mm and a mass of 550 ± 50 g shall be dropped from a height of ≈ 80 cm onto the center of the cold test piece, placed on a hard (stone-)floor. In case of curved test pieces care shall be taken that the test piece is supported on the intended attachment areas.

Immediately following to above the first 3 cycles, the test piece shall be further subjected to the test cycle listed below.

a. 1 h ± 5 min at +60 ± 3°C followed by
b. 1 h ± 5 min at -40 ± 3°C.

This test cycle shall be repeated two further times, 3 cycles total.

3.3.2.4 Stone Chipping. Exterior parts (B) & Type 2 for component validation only. Significant surfaces of the plated component shall be sectioned. For EU platings the chip resistance tests per GMW14700 is performed followed by a thermal cycle (as described under 3.3.2.3) plus 48 hours CASS after chip test with no adhesion loss (plating separation from substrate) and no blistering (visible as distorted reflection) larger than 5 mm diameter at chip site is allowed. For US platings CASS and Thermal cycle are performed after chip testing. This additional test only applies to adhesion assessment, not to corrosion. Other performance criteria in paragraph 3.3.2.3 apply away from chip sites.

3.3.3 Mechanical Requirements.

3.3.3.1 Corrosion Resistance. Shall be determined by the CASS test, GMW14458 ASTM B368/DIN 50021(CASS), according to the number
of hours specified in the Summary Table, Table B1. Note for LAAM non export vehicles only, it is optional to replace the CASS test with the NSS test, GMW3286, according to the number of hours specified in the Summary Table, Table B1. Plated components shall be free of any surface defects an free of corrosion on all significant surfaces when examined at normal reading distance 0.5 ± 0.1 m with the unaided eye and uniform diffused light.

3.3.4 Additional Requirements. Not applicable.

4 Manufacturing Process
Not applicable.

5 Rules and Regulations
5.1 All materials supplied to this standard must comply with the requirements of GMW3001, Rules and Regulations for Material Specifications.
5.2 All materials supplied to this standard must comply with the requirements of GMW3059, Restricted and Reportable Substances for Parts.

6 Approved Sources
Engineering qualifications of an approved source is required for this specification. Only sources listed in the GM Materials File (i.e., GM Supply Power) under this specification number have been qualified by engineering as meeting the requirements of this specification.

For other GM locations, the responsible engineering group should be contacted to obtain the approved source in that individual country.

Note 1: For nonwear interior parts, minimum chromium thickness may be > 0.15 µm if authorized by purchaser and engineering. Approval is indicated by addition of symbol (R) to specification number on drawing.

Note 2: Tin Cobalt alloy may be used in lieu of chromium when symbol (K) is added to the specification number on the drawing.

Note 3: (r) = continuous chrome, (mp) = microporous chrome, (mc) = microcracked chrome.

Note 4: Run water immersion per 3.3.2.3.1(a) (instead of first CASS) with thermal followed by CASS.

Note 5: No impact test during thermal cycle required.

Note 6: Depending on manufacturing and approval location Supplier must choose one variant.

Note 7: For LAAM Non Export Vehicles only, optional to replace CASS with NSS.

1 Scope
This specification covers basic requirements for copper-nickel-chromium electroplated metallic parts, including assemblies.

1.1 Material Description. Platings to this specification are subdivided into three performance classes. Class A is intended for exterior components with severe service conditions likely to include damage from denting, scratching, and abrasive wear, such as those encountered by automotive bumpers. This class requires longer corrosion exposure resistance than Class B, for which components are expected to receive little additional mechanical abuse. For exterior applications, discontinuous chromium plate (microporous (mp) or microcracked (mc)) in addition to a multiple layer nickel system shall be used. Class C is intended for interior applications and does not require the use of discontinuous chromium or multiple-layer nickel systems. For interior application a continuous chrome layer (r) is permissible. Plating per this specification is intended for use over metallic substrates; plating on plastics is specified in GMW 14668.

1.2 Symbols. Not applicable.

1.3 Typical Applications. This type of finish shall be principally used for decorative purpose, including bright and other (e.g., satin, brushed, grained) appearances for interior and exterior applications, as defined by styling and specific appearance standards.

1.4 Remarks. Not applicable.

2 References
Note: Only the latest approved standards are applicable unless otherwise specified.

2.1 External Standards/Specifications.
ASTM B368 ISO 1463
ASTM B456 ISO 2177
ASTM B571 ISO 3497
ASTM B764 SAE/USCAR-5
DIN 50021 SAE/USCAR-7

2.2 GM Standards/Specifications.
GMW3001 GMW14458
GMW3059 GMW14668
GMW3286 GMW14829

3 Requirements
3.1. Plating Thickness. Shall be determined by the microscopic method (ISO 1463) or the electrochemical method (ISO 2177), or by X-Ray method (ISO 3497). In case of disagreements between purchaser and supplier, the microscopic method shall be the preferred method.

3.1.1. Minimum plate thickness as specified in Table 1 is intended to apply to all low current density and high current density areas of significant surfaces as specified on appropriate part drawings or as otherwise agreed upon between purchaser and supplier (written statement). Such surfaces are those normally visible - directly or by reflection - on the finished part when assembled in vehicle position, or which can be the source of corrosion deposits that deface visible surfaces on the assembled vehicles. If corrosion products are visible anywhere on a finished & dressed component in vehicle position, this specification is not met.

3.1.2 For systems with a total nickel layer thickness ≥ 20 microns, multiple layer nickel thickness consisting of at least two layers of electro-deposited nickel shall be as follows:

<table>
<thead>
<tr>
<th>Type of Nickel Layer</th>
<th>Thickness Relative to Total Nickel Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bottom (semi bright)</td>
<td>60 to 80% Note 1</td>
</tr>
<tr>
<td>Middle (high-S)</td>
<td>Not applicable ≤ 10%</td>
</tr>
<tr>
<td>Top (bright)</td>
<td>20 to 40% ≥ 30%</td>
</tr>
</tbody>
</table>

Note 1: If the total nickel layer thickness is < 20 microns, the semi bright thickness shall be 50% minimum.

© Copyright 2007 General Motors Corporation All Rights Reserved

June 2007 Originating Department: North American Engineering Standards Page 1 of 6
3.1.3 Exceptions to the minimum plating thickness are generally shown as a detail on the part drawing by either designating plating checkpoint(s) or by indicating in an appropriate view the area(s) where deviated thickness(es) are allowed. These exceptions must still meet the specified number of corrosion test hours.

3.1.4 Minimum thickness and corrosion resistance performance requirements for textured finishes (e.g., brushed) apply after texturing.

3.2 Substrate/Molded Part.

3.2.1 Substrate Structure. Parts shall demonstrate no defects such as cracks, shrink holes, or surface porosity. Parts shall be free of internal tension, which may influence adhesion or appearance of the plating.

3.3 Relief from Hydrogen Embrittlement. All steel parts heat treated or cold worked to a specified core hardness of Hardness, Rockwell “C” Scale (HRC) 32 or greater or a surface hardness of HRC 35 or greater, that are finished in accordance with this specification, must be processed by the applicator per SAE/USCAR-5 and tested for de-embrittlement per SAE/USCAR-7.

3.4 Nickel Electrochemical Potential (Only Exterior Parts). Determination of electrochemical potential difference between plating layers shall follow ASTM B764 (STEP test). A schematic view of a typical STEP chart is shown in Appendix B.

3.4.1 The bright (or satin) nickel layer shall exhibit an anodic electrochemical potential difference of 100 to 200 mV to semi bright nickel on all significant surfaces. The supplier must demonstrate the conformance to this requirement by using appropriate statistical charting techniques on a routine quality control basis.

3.4.2 The micro particulate nickel layer shall exhibit a cathodic electrochemical potential difference of 10 to 40 mV to the bright or satin nickel on all significant surfaces of all substrates.

3.4.3 If a micro crack chrome plating system is used, no micro particulate electrochemical potential difference will be measurable.

3.4.4 The optional “high activity nickel strike” layer shall exhibit an anodic electrochemical potential difference of 15 to 40 mV to the bright nickel layer.

3.5 Discontinuous Chromium, shall be performed by either the copper deposition (Dubpernell) method or by the determination of active corrosion sites after corrosion testing. Both are described in the appendix of ASTM B456. In the case of an active sites determination, compare the viewed sample at 100X to the pore density charts shown in Appendix A of this specification to determine pore count.

3.5.1 Microporous System (mp). The micro discontinuous chromium surface shall exhibit a minimum of 10,000 pores/cm² as determined by copper deposition or 2000 pores/cm² as determined by active sites per ASTM B456 Appendix X4 or X5.

3.5.2 Microcracking System (mc). The cracked chromium surface shall exhibit 300 to 800 cracks/cm in all directions and provide a closed homogenous network in all directions.

3.5.3 The surface pores or cracks shall be invisible to the unaided eye.

3.6 Adhesion.

3.6.1 Saw Grind Test. Plated components shall be subjected to the Saw-Grind Test, ASTM B571, with no evidence of lifting or peeling between plated layers or between plating and substrate. Place pressure sensitive adhesion tape, as described in GMW14829 approximately 10 to 20 mm wide over the cut edge (leaving sufficient length of tape to grasp between fingers for quick removal); quickly pull tape at approximately 90 degrees to the surface of part to remove entire strip. Examine for evidence of lifting of electroplate.

3.6.2 Thermal Shock Test. A temperature shock test to determine the adhesion must be performed. The temperature depends on the type of substrate. Parts shall be heated to the temperature listed below for 1 h ± 15 minutes and then direct immersed to water at room temperature (23°C ± 3K). The requirement is no blistering or flaking of the coating after immersion.

- Steel   300°C ± 10 K
- Copper   250°C ± 10 K
- Zinc     150°C ± 10 K
- Aluminum 150°C ± 10 K

Parts which are exceptionally large may be cut/sectioned to fit in the oven.

3.7 Mechanical Requirements.

3.7.1 Corrosion resistance shall be determined by the CASS test, GMW14458, ASTM B368, or DIN 50021(CASS), according to the number of hours specified in the Table 1. (As noted in Table 1, some limited applications may allow the use of Salt Spray testing.) Plated components shall be free of any surface defects and free of corrosion on all significant surfaces when examined at normal reading distance (0.5 ± 0.1 m) with the unaided eye and uniform diffused light.
4 Manufacturing Process
Not applicable.

5 Rules and Regulations
5.1 All materials supplied to this standard must comply with the requirements of GMW3001, Rules and Regulations for Material Specifications.
5.2 All materials supplied to this standard must comply with the requirements of GMW3059, Restricted and Reportable Substances for Parts.

6 Approved Sources
Engineering qualification of an approved source is required for this standard. Only sources listed in the GM Materials File (i.e., Supply Power) under this standard number have been qualified by engineering as meeting the requirements of this standard.

For other GM locations, the responsible engineering group should be contacted to obtain the approved source in that individual country.

Notes:

Note 1: For nonwear interior parts, minimum chromium thickness may be 0.13 μm, if authorized by purchaser. Approval is indicated by note on part drawing.

Note 2: Copper may be used but not required. If not used at supplier option, then nickel must be used to meet the total plate thickness requirement. When copper is not used for plating steel substrates to GMW 14672 Class A or B requirements, the total minimum nickel thickness is reduced to 30 μm for both Class A, and Class B.

Note 3: Chromium thickness is limited to 0.5 μm to prevent overlaying the microparticulate nickel pores if used. Exceeding this limitation may be acceptable provided that pore count is proper. Microcracked chromium deposits shall have a minimum thickness of 0.8 μm.

Note 4: Tin Cobalt alloy may be used in lieu of chromium when symbol (K) is added to the specification number, e.g. “GMW 14672 Class C (K).”

Note 5: For cloisonné type substrates, copper is optional.

Note 6: Suitable pretreatment processes must be developed for each type of alloy and processes of manufacture of the alloy. All pretreatment of aluminum processes must pass all visual adhesion and corrosion resistance properties as specified prior to production on each type of alloy and each type of manufacturing process of aluminum.

Note 7: All plated components must receive an aluminized wax or other corrosion-resistant coating on nonsignificant surfaces unless otherwise specified on the drawing.

Note 8: If authorized by purchaser and for use only in markets where vehicle operating corrosion environments are negligible. Salt Spray testing per GMW3286 may be substituted in place of CASS testing as follows: 66 hours CASS or 216 hours Salt Spray, 44 hours CASS or 144 hours Salt Spray, 8 hours CASS or 24 hours Salt Spray. This test substitution will not be allowed for use in North America or Europe.

3 Resources

3.1 Facilities.
Not applicable.

3.2 Equipment.
Molded parts from production tooling (not the tool or cold pour impressions from tooling).

3.3 Test Vehicle/Test Piece.
Minimum of two samples.

3.4 Test Time.
Not applicable.

3.5 Test Required Information.
Not applicable.

3.6 Personnel/Skills.
Not applicable.

4 Procedure

4.1 Preparation.
Parts should be installed in vehicle or buck; if property is not available, the part is held in approximate installed position.

4.2 Conditions.

4.2.1 Environmental Conditions.
Not applicable.

4.2.2 Test Conditions.
Deviations from the requirements of this standard shall have been agreed upon. Such requirements shall be specified on component drawings, test certificates, reports, etc.

4.3 Instructions.

4.3.1 Evaluate parting line; visual and tactile (perceptible to the touch).

4.3.2 Visually and tactilely inspect parts for parting line execution.

4.3.3 Test Sample Preparation. Tool Mismatch – Parting Line core to cavity; Parting Line at edge of part. (See Figure 1 and Figure 2.)

4.3.4 Maximum 0.05 mm mismatch, unless otherwise specified, or designed as an offset.

4.3.5 Texture execution stops at 0.25 mm minimum to 0.50 mm maximum to protect parting line appearance.

4.3.5.1 Tool Mismatch - Parting Line core to cavity; Parting Line at edge of part.

4.3.5.2 Texture execution stops at 0.25 mm minimum to 0.50 mm maximum to protect parting line appearance.

Figure 1: Tool Mismatch and Parting Line Texture Execution
4.3.6 Seamless Execution Parting Line. See Figure 3.

4.3.7 No Tool Mismatch Allowed. Applies to:
4.3.7.1 Parting Line on A-Surface (Lifter/Slide to cavity).
4.3.7.2 Core to cavity on Tactile parts (handles, knobs, switches, etc.).

4.3.8 Texture execution stops at 0.10 mm minimum to 0.20 mm maximum to protect parting line appearance.

4.3.9 The part submission and evaluation procedure is repeated until all issues are in agreement.

5 Data
5.1 Calculations. Not applicable.
5.2 Interpretation of Results. Not applicable.
5.3 Test Documentation. Global Pre-texture Instruction Form (GIF), Appearance Approval Report (AAR).

6 Safety
This standard may involve hazardous materials, operations, and equipment. This standard does not propose to address all the safety problems associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

Test to GMW15424

9 Release and Revisions
9.1 Release. This standard originated in August 2006, replacing GM9684P. It was first approved by Global Appearance Quality in October 2007. It was first published in November 2007.
Krombeläggningar på metaller

Orientering

Denna standard omfattar elektrolytiska beläggningar av nickel plus krom alternativt koppar plus nickel plus krom, på gütjärn, stål, zinklegeringar, koppar och kopparlegeringar med undantag av:
- beläggningar på gängor (med tolerans)
- beläggningar på plåt, band eller tråd i obearbetad form, eller på skruvfjädrar
- beläggningar pålagda av andra skäl än skydd eller dekoration.

1. Kontrollbestämmelser

STD 340.

2. Definition

Kravyta: del av artikels yta som är väsentlig för utseende eller användning och som skall täckas eller täcks av ytbeläggningen.

Vid behov skall kravytan anges på ritning eller vara markerad på likare.

Chromium coatings on metals

Contents

Introduction

1. Inspection regulations

2. Definition

3. Designations and coatings

4. Requirements

5. Testing methods

Introduction

This standard covers electrolytic coatings of nickel plus chromium or alternatively copper plus nickel plus chromium on cast iron, steel, zinc alloys, cast and copper alloys with the exception of:
- coatings on threads (With tolerances)
- coatings on sheet metal, strip or wire in unworked form, or on helical springs
- coatings applied for reasons other than for protection of decoration.

In technical respects this standard conforms with SS-ISO 1456 and ISO 1457. The coatings are a limited selection of those appearing in SS-ISO 1456 and ISO 1457 respectively.

1. Inspection regulations

STD 340.

2. Definition

Significant surface: that part of the part’s surface that is crucial for appearance or utilization and which is to be covered or is covered by the surface coating.

Where necessary the significant surface is to be marked on the drawing or on a sample.
### 3. Beteckningar och beläggningar

Följande beläggningar används för artiklar som ut- sätts för svåra korrosionsförhållanden, t ex utvändiga artiklar:

| Zinc alloys |       | |

**Tabell 2**

**Table 2**

1) Inom parentes angivna beteckningar är äldre och skall ej användas.
2) Nickelskikten skall vara dubbla, se avsnitt 4.2.1.

1) The designations in brackets are older and should not be used.
2) The layer of nickel is to be double, see section 4.2.1.
4. Fordringar

4.1 Allmänna fordringar

4.1.1 Utseende

Den ytbelagda artikelns krav skall vara fri från tydligt synliga ytbehandlingsfel, såsom blåsor, gropar, sprickor eller ofullständigt belagda partier och får ej vara fläckig eller missfärgad.

Om ej annat anges på ritning skall den förkromade ytan vara blank. Ytseende jämförs om så erförs med likare som godkänts av Saab.

4.1.2 Tjocklek

Siffrorna efter de kemiska tecknen Cu och Ni anger kopparskiktets resp nickelskiktets mintjocklek i \( \mu m \).

Tjockleken skall mätas enligt ISO 1463, antingen på överenskomna mätpunkter (på kravytan) eller var som helst på kravytan där beröring kan ske med en kula med diametern 20 mm.

På zinklegeringar skall ett kopparskikt med mintjock-lek 10 \( \mu m \) läggas på före nickelnbeläggningen.

Krombeläggningens tjocklek skall mätas enligt ISO 2177 med elektrolyt B4 som provningslösning, antingen på överenskomna mätpunkter (på kravytan) eller var som helst på kravytan där beröring kan ske med en kula med diametern 20 mm.

4.1.3 Vidhäftning

Beläggningens vidhäftning skall bedömas enligt någon av de metoder som anges i avsnitt 5.1 och 5.2. Beläggningen skall fortfarande håfta vid basmetallen efter att ha utsatts för den valda provningen.

4. Requirements

4.1 General requirements

4.1.1 Appearance

The significant surface of the coated part is to be free from clearly visible surface treatment faults, i.e. bubbles, pits, cracks or sections not completely coated, and is not to be mottled or miscoloured.

Unless otherwise stated on the drawings the chromium-plated surfaces are to be bright. If required the surface appearance is to be compared with a sample approved by Saab.

4.1.2 Thickness

The numbers following the chemical symbols Cu and Ni indicated the minimum thickness of the copper and nickel layers in \( \mu m \). The thickness is to be measured in accordance with ISO 1463, either at the agreed measurement point (on the significant surface) or anywhere else on the surface that can be touched by a ball 20 mm in diameter.

A layer of copper of a minimum thickness of 10 \( \mu m \) is to be applied on zink alloys before coating with nickel.

The thickness of the chromium coating is to be measured in accordance with ISO 2177 using B4 electrolyte as the test solution either at the agreed measurement points (on the significant surface) or anywhere else on the surface that can be touched by a ball 20 mm in diameter.

4.1.3 Adhesion

The adhesion of the coating is to be assessed using one of the methods described in sections 5.1 and 5.2. The coating shall continue to adhere to the basis metal when subjected to the test selected.
4.1.4 Korrosionshärdighet

Förkromade artiklar ska utsättas för korrosionsprov enligt tabell 3. Detta prov är till för att kontrollera beläggningsarnas kontinuitet och kvalitet och provningstidens längd behöver inte ha något direkt samband med den ytbehandlade artikels livslängd.

Tabell 3

</tbody>
</table>

Anm

Note

The testing times are shorter when the base metal is copper or copper alloys than for iron, steel or zinc alloys. This is necessary because in the same environmental class nickel coatings on copper and copper alloys are thinner than on iron, steel or zinc alloys. The use of these thinner and less corrosion resistant coatings is justified by the slower attack of corrosion on copper and copper alloys once the coatings have been penetrated. The testing times should therefore not be regarded as a direct measurement of the general performance capacity in use.
4.2 Special requirements for different types of coatings

Anm - Leverantören kan välja det alternativ som han bedömer lämpligast med hänsyn till produktionsutrustningen. Leverantören skall dock meddela Saab enligt vilket alternativ han önskar leverera. Övergång till annat utförande får ej ske utan Saabs kurs och godkännande. Beläggningarna 102, 104 och 312 skall alltid utföras som dubbel-skiktbeläggning enligt punkt 4.2.1.2.

Note - The supplier is to select the alternative that he considers the most suitable with regard to the production equipment. However, the supplier is to inform Saab of which alternative he wishes to supply. Change to another design may not occur without Saab's knowledge and approval. Coatings 102, 104 and 312 are always to be a two-layer coating as described in point 4.2.1.2.

4.2.1 Nickel coating

4.2.1.1 Dull or semi-bright coatings
Sulphur content: 0,005 % max
Elongation: 8 % min When testing as per section 5.3

4.2.1.2 Double layer coatings
a) Bottom layer
Sulphur content: 0,005 % max
Elongation: 8 % min When testing as per section 5.3
Minimum thickness: 60 % of the total nickel thickness
b) Top layer
Sulphur content: in excess of 0,04 %.
Minimum thickness: 20 % of the total nickel thickness

4.2.2 Chromium coatings

4.2.2.1 Micro-cracked chromium
Crack pattern showing more than 250 cracks/cm in any direction forming a closed network over the whole of the significant surface.
Minimum thickness: 0,3 µm (the minimum thickness is to be 0,25 µm for coatings on stainless steel).

4.2.2.2 Micro-porous chromium
Number of pores: at least 10 000/cm² The pores shall be invisible to the unaided eye.
Minimum thickness: 0,3 µm (the minimum thickness is to be 0,25 µm for coatings on stainless steel).

5. Testing methods

5.1 File test for adhesion
Saw off a piece of a plated article, hold it in a vice and apply a coarse file to the cut edge in such a manner as to try to raise the deposit. File in the direction from the basis metal to the coating at an angle of approximately 45° to the coated surface.
5.2 Vidhäftningsprovning genom hastig avkylning

Värma en belagd artikel under 1 h i en ugn vid den temperatur som nedan anges för ifrågavarande basmetall, med en tolerans av ± 10 °C:
- stål - 300 °C
- zinklegering - 150 °C
- koppar eller kopparlegering - 250 °C

Artikeln kyls sedan hastigt genom doppning i vatten av rumstemperatur. Provningen kan försämrar artikelnens mekaniska egenskaper.

5.3 Duktilitetsprovning

5.3.1 Provberedning

Tillverka en ytbelagd provstrimla 150 x 10 x 1 mm på följande sätt:

Klipp ut provstrimlan ur den ytbelagda plåten med plåtsax. Avrunda eller fasa provstrimlans långa kanter, åtminstone på den belagda sidan, genom omsorgsfull filning eller slipning.

5.3.2 Provning

Böj provstrimlen med den belagda sidan under sträckning med kontinuerligt pålagt tryck, 180° över en dorn med diametern 11,5 mm till strimalns två ändar är parallella. Se till att kontakt råder mellan strimal och dorn under böjningen.

5.3.3 Bedömning

Beläggnningen anses uppfylla kravet på minst 8 % förlängning om det efter provningen inte finns några sprickor som sträcker sig över hela den konvexa ytan. Små sprickor vid kanterna medför inte underkännande.

### Ändringar från föregående utgåva

Standarden är, för nykonstruktion, ersatt av GME00251.
