PART 2 OF 2

PART 2 OF 3

From: Estes, Eric (E.E.)
Sent: Thursday, May 21, 2009 6:28 PM
To: Estes, Eric (E.E.); 'Abe Ghaphery'; 'Andrew Williams'; 'Anthony Fleenor'; 'Costas Chrysochoidis'; 'Geoff Jacks'; 'Robert Kinnear'; 'Simon Malsbury'; 'Mark Karwowski'; 'Jim.Duehring@TRW.COM'; 'Salim.Semssar@TRW.COM'; 'Sanjay.Singh@TRW.COM'; 'Martha Abundis'; 'phil.browne@trw.com'; 'andy.ausband@trw.com'; 'Greg Bendzinski'; 'Glenn.Bailey@TRW.COM'; 'William.Olsen@TRW.COM'; 'Paul IRELAND'; 'Jason Johnson-contr'; Bouse, William (W.J.); Bahena, Miguel (Mike.); Diez, Timothy (T.P.); Christiansen, Jens (J.F.); Porter, Wesley (W.); Frey, Martin (M.F.); Hochrein, Brad (B.G.); Rossi, Roberto (R.A.)
Subject: 2010 CD3 #4 warranty return
Attachments: #4 gear warranty return data.pdf

Just got an email on another 2010 CD3 warranty return**#4**, **C1B00-62(B93) & C200D-49(motor rotational angle sensor) unsure what "B" motor position fault set**. See the attachment for the diagnosis the tech used and codes set from the other modules. This time the Interactive Online Diagnosis picked up the codes prior to the U3000-96(B69) but did not pick up the snap shot data I talked today with the diagnostic programmers on why the snapshot did not work so they are looking into that now. I will hot process this gear back for evaluation hopefully I see this gear next week, I will update everyone with tracking number.

Eric J. Estes
Warranty Analyst - TRW Automotive

Menu Selection: Inspection and Verification

IV1: VISUAL INSPECTION

- Verify the customer concern.
- Visually inspect the electronic power assist steering (EPAS) system for obvious signs of mechanical or electrical damage.

NOTE: When inspecting the bellows boots make sure to use a strong light source and an inspection mirror.

VISUAL INSPECTION CHART

Mechanical	Electrical
Binding or misaligned steering column.	Battery junction box (BJB) fuses 1 (50A) and 2 (50A)
Loose steering column shaft bolts.	Smart junction box (SJB) fuse 42 (10A)

Steering column shaft couplings/U-joints	Wiring, terminals or connectors.
Steering gear	
Steering gear bellows boots	
Inner tie-rod ends	
Outer tie-rod ends	
Tire pressure	
Tires	

- **Is an obvious cause for an observed or reported concern found?**

No
Go to Known Concerns

KC1: KNOWN CONCERNS

- Ignition ON, engine OFF.
- Press Read Vehicle Information button to retrieve DTC s from the vehicle. NOTE: DTCs may be displayed from previous diagnostic actions.

Vehicle Information:

VIN 3MEHM0HA9AF[redacted]

Current DTCs {retrieved 21 May 2009 11:46:07}

DTC	Description / Action	Source
N/A	No DTCs to report	

Historic DTCs {retrieved 21 May 2009 11:46:07}

DTC	Description / Action	Source
U3000:96	Control Module: Component Internal Failure **Description:** The PSCM is self monitoring and will carry out self-tests at specific intervals (initial power up, power down, during normal operation, etc.). Each self-test requires the voltage supply to the PSCM to be at or above a specific level (above 6 volts, above 9 volts, between 10 and 17 volts, etc.) for the test to take place. If one or more of the self-tests should fail, then the module will set one or more DTCs. • DTC U3000:41 (Control Module: General Checksum Failure) - If at any time during normal operation the module detects an internal software error with more than 6 volts supplied to the PSCM, then DTC U3000:41 will be set. • DTC U3000:46 (Control Module: Calibration/Parameter Memory Failure) - At any time during normal operation with more than 6 volts supplied to the PSCM the module determines that one or more calibration files are missing or that they are corrupt or that the incorrect EPAS gear is installed on the vehicle, then DTC U3000:46 will be set . • DTC U3000:49 (Control Module: Internal Electronic Failure) - If at any time during normal operation with more than 6 volts supplied to the PSCM, the module detects a software or internal hardware error then the DTC U3000:49 will be set. • DTC U3000:61 (Control Module Signal Calculation Failure) - If the PSCM detects that assist torque calculation is faulty due to a software failure in the module, then DTC U3000:61 will be set. • DTC U3000:72 (Control Module Actuator Stuck Open) - During initial power up with voltage greater than 9 volts, the PSCM will check the internal relay for voltage. If voltage is not present the module will make several attempts to close the relay. If the voltage remains undetected after this test period, then DTC U3000:72 will be set. • DTC U3000:96 (Control Module: Component Internal Failure) - This DTC will set if there is an internal failure of the PSCM due to temperature, power supply or if multiple failures have occurred over a short period of time. **Possible Causes:** • Heat shield missing. • Steering gear internal failure. • Incorrect EPAS gear installed. • Ice/frost build up on relay contacts. • Heavy loads on the EPAS gear. • Excessive ambient temperatures. **Diagnostic Aids:** For DTC U3000:41, the PSCM will remove steering assist, enter into a manual mode and transmit an invalid steering angle message over the HS-CAN bus. The module will also send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:46, initially the PSCM will use a default steering assist and may set DTC U2100:00. If DTC U3000:46 returns on the next ignition cycle, then the PSCM will remove steering assist, enter into a manual mode and send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:49, the presence of this DTC may or may not affect steering assist. It will depend on what other DTCs (if any) are set along with U3000:49. Diagnose all other DTCs before diagnosing U3000:49. For DTC U3000:61, the PSCM will remove steering assist, enter into a manual mode and transmit an invalid steering angle message over the HS-CAN bus. The PSCM will also send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:72, this DTC indicates that a specific internal relay is either stuck open or has excessive resistance. In cold climates or climates where frost is possible, the relay contacts could develop a layer of frost which may prevent a clean connection between the relay contacts. It may be necessary to allow the vehicle to remain outside overnight in a cold climate to duplicate the DTC trigger conditions. If U3000:72 sets again on subsequent ignition cycles, then the PSCM will remove steering assist, enter into a manual mode and send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:96, the presence of this DTC may or may not affect steering assist. It will depend on what other DTCs are set along with U3000:96. If steering assist is affected the PSCM will send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. **Action:** GO to Pinpoint Test C.	PSCM

DTC U3000:96 (PSCM) - Control Module: Component Internal Failure

⊞ C: DTC U3000: Control Module - Signal Calculation Failure and Component Internal Failure

⊟ C1: VERIFY PRESENCE OF EPAS GEAR HEAT SHIELD

- Make sure the EPAS gear heat shield is present and installed correctly. Refer to Section 211-02.
- **Is the heat shield present and is it installed correctly?**

Yes
Go to C2.

⊟ **C2: TEST DRIVE TO CHECK FOR RETURNING DTCS. - Fault outcome**

-
- Cycle the ignition to OFF and then back to RUN.

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

- Test drive the vehicle in the following manner:
  —With the engine running/ready, stop the vehicle on an unsealed concrete or asphalt surface (in order to provide adequate friction for a thorough test).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.
  —Return the steering wheel to the center position and move the vehicle forward approximately 32 cm (1 ft).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.
  —Return the steering wheel to the center position and move the vehicle forward approximately 32 cm (1 ft).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.

NOTE: The next portion of the test drive will require the vehicle to be driven at highway speeds.

NOTE: The test period is a cumulative time of 10 minutes. Stopping, going slower than 72 km/h (45 mph) or faster that 96 km/h (60 mph) will not affect the test as long as a total time of 10 minutes is spent between 72-96 km/h (45-60 mph) with at least 4 lane changes during that time/speed window.

- Continue test driving the vehicle in the following manner:
  —Bring the vehicle to a minimum speed of 72 km/h (45 mph), maximum of 96 km/h (60 mph).
  —Maintain that speed for at least 10 minutes.
  —During this 10-minute time period, make a minimum of 4 lane changes or turns that achieve a steering wheel angle of at least 20 degrees.
  —The test drive is complete.
- Press Read Vehicle Information button to retrieve DTC s from the vehicle. NOTE: DTCs may be displayed from previous diagnostic actions.

Subject: 2010 EPAS CD3 Claim # 40862 VIN#3FAHP0HA1AR[redacted]

Jorge/Hari -

We have the attached CD3 EPAS claim with little useful description and no contact information. The dealer is a Dollar/Thirfty Rental company and I am not sure how to make contact with them w/o any information in the claim outside of making cold calls to them.

Who is the FCSD contact for HSAP and any suggestion on how we can follow up on this claim? Thank you.

Do you have also information on the established countermeasures.

You mentioned for example the diagnostic.
This is also something Tyco told me.
They are selling this relay also to other OEM, but this failures are occurring on TRW only.
So their assumption is that the TRW fault diagnostic is to sensible.

Betreff: RE: B3A Woodpecker

Rudi,

Since the start of CD3/ rfr production we have seen B3A/B43 faults due to multiple root causes (at least 7 or 8 that I can think of). In general the numbers of failures has been dramatically reduced but not 100 % eliminated.

Attached is a file that summarizes all TRW Rack EPAS B3a and relay failures showing all the different root causes, and failure run charts.

Yes for CD3/ rfr U502 we employ Hot Puma at QAO and Marion but there are investigations to move this testing to Anting.

Unfortunately the B3a diagnostic is highly sensitive and I do think the start point relay is robust enough to the sensitivity of the diagnostic. Because of this I think we need to move to a solid state electronic PIR function to move the needle further. Thanks.

Sincerely,

Mike Bahena

Subject: B3A Woodpecker

There has been activities in the past (CD3 and rfr to reduce Tyco relay failures, like woodpeckering, Puma tester and fault diagnostic changes.

Currently C1 is facing B3A failures as well.

Is someone able to pull together all this thing and give us an overview?

Are CD3 / rfr not seeing this issues?

Best regards / Mit freundlichen Gruessen

Subject: B3a is not very high on the radar at HSAP

Per 2 sources the B3a is not on the radar of the HSAP Plant or Launch Management team.

There is not awarenes that this is a repeat quality issue. HSAP incoming quality is concerned with containment and is working with the local TRW support.

Obviously we will not tell TRW, but I wanted you to be aware.

Sincerely,

Mike Bahena

Subject: B9a on C346 DEMS Fleet Issue

Rob,

Last week, I reported to you a B9a issue on a C346 Dems fleet vehicle. TRW removed the gear and analyzed. The root cause was already known. The root cause was an interaction issue between the power regulator and the CPU. It was also identified during CD3 warranty analysis. For CD3 warranty, TRW fixed the issue with a software change. The same software fix was implemented for C346.

Please let me know if you require more information on this issue.

Sincerely,
Tim Diez

ORIGINATOR:
Bill Bouse
DATE:
August 25, 2009

EPAS MODEL:
2011 Tune update to CD3

DATE OF IMPLEMENTATION:
FORD:
2011 MY CD3

DESCRIPTION OF CHANGE:

Implement a new tuning for the 2011 MY CD3 program. To be timed as part of the AE5C 3200 CC gear delivered to Ford for all prototypes and production per program timing already provided.

BACKGROUND/COMMENTS:

Vehicle dynamics has requested an update to the tuning for the CD3 program.

Vehicle tuning file (.par) will be delivered to TRW systems engineering on or before September 11, 2009.

INITIAL AND DATE:
WB 25 August 2009 ENGINEERING Cost Estimating

Subject: EPAS Replacement

Eric & Tim

Could you please take a look at the attached claim. I have not talked to the technician - but looks like an EPAS rack replacement… Would be interesting to get this part back?

Claim 741848 EPAS Replaced.pdf…

Subject: FR 210 interrim findings

Hello Eric,

like discussed on the phone some minutes ago:
FR 210 was analyzed today and we were able to reproduce a open circuit on the segment PCB side of the CS.
The resistance could be reproduced from a single digit Ohm range to a Mega Ohm range.
This is the good news.

The bad news is that there is a slight stress mark on the CS cable that might indicate overturning. Since Hella did not open the CS we can not tell for sure what the RC for the open is.
For further analysis the CS will be sent to Tyco since the next analysis step on the CS would be destructive and we should better not do that on Hella side and push it to Tyco.

Tomorrow you will receive some nice pics that we took today.

I hope we can have some more results available by next week in case the part arrives quick enough at Tyco.

Thats it so far.

Mit freundlichen Grüssen / Best regards

Subject: FR-0004 Ribbon Cable Issue

TRW Team, on FR-0004 we are relying on a manual process to make sure that the connector is put into the EPP without damaging the terminals on the ribbon cable. Updating the job instructions is really not a fix, good to have but for sure does not mean it will never happen again. So the current timing that I have been able to gather is to look at the concern 5 weeks from now. Not acceptable for such a fix, unless I am missing something this is being added to the existing tooling to add a guidance feature. Need to get this into production as quickly as possible. It ahs been 2 months since we removed this gear from the car and we are over a month from a concept review, not acceptable.

Subject: Re: Updated: Ford/TRW EPAS Warranty Meeting

Mike,

Attached Bully data for the B9A ECU.

>>> "Estes, Eric (E.E.)" <eestes@ford.com> 6/1/2009 12:35 PM >>>
When: Occurs every Monday effective 6/8/2009 until 12/7/2009 from 11:00 AM to 12:00 PM (GMT-05:00) Eastern Time (US & Canada).
Where: Teleconference 866-228-1482 code 3753904

~~*~*~*~*~*~*~*~*~*

At this time we have moved the warranty meeting to every Monday starting at 11am for one hour to cover the five warranty returns. See chart attachment for updated information on all 5 warranty returns. (see below for the webmeeting call-in numbers)

Any questions on the returns email back, next Mondays meeting will explain more detailed information of the three gears in analysis.

<<2010 CD3 EPAS Warranty Return Chart.xls>>

This is a Bi-weekly meeting that meets on Mondays and I scheduled this meeting for 11:30am to 12:00pm at this time due to TRW/Ford scheduling conflicts. We can agree on a permanent time for all to attend we just need to remember that the UK will need to report at times and they are 5 hours ahead of us.

At this meeting we will go over the current status of warranty returns and in-process returns.

Updates on any warranty process or EPAS gear activity:

* EPAS Diagnosis at dealers
* Gears in process to WPAC
* WPAC Gear Reviews
* Received Gears
* Status of Current Returns (Fred Beans Ford return).

Let me know of schedule conflicts and if I need to invite additional people to this meeting. Thanks

Eric Estes invites you to this warranty meeting, call-in numbers below and if needed webmeeting for web conference.

Subject: FR0051(No Com)

Bill/Tim FR0051 (No Com) returned and analyzed at 26-mile for an over-voltage to the main micro(badly burned). We have pics but nobody sent them to me yet but I feel this is a external voltage spike issue because the vehicle came in for a no start & abs lamp on for the same no communication issue and the tech replaced the PCM & ABS module to fix vehicle(see attached AWS history report) the abs module was denied by the RTDA group so that module does not show-up in AWS.

Simon/Rob could you send the pictures of the micro to Tim & Bill thanks

We can call the dealer to see if they can remember what happened.

Cc: Beattie, Mike (M.A.); Dorony, Kenneth (K.R.)
Subject: FR0070- Friction code P07AE-09 (NTF on return gear)

I found out through the Interactive diagnosis that this tech did not hit the clear button at the beginning of step"F4", before the road test. I talked to the tech at the dealer and he told me he everytime he started and drove the vehicle had no assist, but not 100% sure he cleared the codes, he told me he did but this was worked on over one month ago. The clear code button is not on the diagnostic page that we can see, but should state "complete" when done on the technician's online diagnosis page.
So I asked Mike Beattie if there is a way to make the tech clear the codes before going forward on the road test in the diagnostics that way there is no confusion with the status of the code for current or historic and there is no confusion on the last step before EPAS rack replacement.

Recent Warranty Repair History: No recent repair history on vehicle

Review the OASIS results below for any known concerns related to the current vehicle.

SSM: 20782 2008- 2010 FUSION, MILAN, MKZ - NO LONGER INCLUDE THE STEERING WHEEL LOCKFEATURE. ALL 2008 - 2010 FUSION, MILAN, AND MKZ VEHICLES BUILT AFTER 12/1/2007 HAVE INCORPORATED AN ELECTRONIC PASSIVE ANTI-THEFT SYSTEM (EPATS) KEY SYSTEM FOR THEFT PROTECTION AND REPLACING THE MECHANICAL STEERING WHEEL LOCK FEATURE THEFT PROTECTION. IMPORTANT: DO NOT REPLACE THE STEERING COLUMN FROM A PRE-12/1/2007 BUILT VEHICLE WITH THE NEW EPATS EQUIPPED COLUMN. THE COLUMNS ARE NOT INTERCHANGEABLE. A DEALER THAT INTERCHANGES THE COLUMNS COULD BE SUBJECT TO GOVERNMENT FINES UP TO $6,000 PER VEHICLE FOR RENDERING INOPERATIVE A REQUIRED SAFETY FEATURE. Effective Date: 05/06/2009	1 out of 1 303000
SSM: 20795 2010 FUSION/MILAN - 2.5L/3.0L EPAS EQUIPPED VEHICLES - SQUEAK AND RATTLE SOME 2010 FUSION/MILAN EQUIPPED WITH 2.5L OR 3.0L AND ELECTRONIC POWER ASSIST STEERING (EPAS) MAY EXHIBIT INCREASED LEVELS OF ROAD NOISE, THAT CAN BE HEARD INSIDE THE VEHICLE WHILE DRIVING. THE STEERING GEAR/DASH SEAL -(BASE PART NUMBER 3611B) MAY NOT BE PROPERLY SEATED. THE CORRECT POSITION OF THE STEERING GEAR/DASH SEAL CAN FOUND IN WORKSHOP MANUAL SECTION 211-02. NOTE: THIS ROAD NOISE DOES NOT IMPACT THE FUNCTION OR DURABILITY OF THE STEERING SYSTEM AND IT IS CONSIDERED A CUSTOMER IRRITATION. Effective Date: 05/14/2009	1 out of 1 303000
SSM: 20831 2010 FUSION/MILAN ELECTRONIC POWER ASSIST SYSTEM (EPAS) - INTERACTIVE DIAGNOSIS THE 2010 FUSION/MILAN WORKSHOP MANUAL SECTION 211-00A HAS BEEN UPDATED WITH INTERACTIVE DIAGNOSTICS. THIS SECTION PROVIDES NEW INFORMATION ABOUT DIAGNOSTIC TOOLS FOR THE ELECTRONIC POWER ASSIST STEERING (EPAS) AND THE POWER STEERING CONTROL MODULE (PSCM). THIS NEXT GENERATION OF VEHICLE DIAGNOSTIC SOFTWARE IS DESIGNED TO AID TECHNICIANS IN IDENTIFYING VEHICLE CONCERNS BY ALLOWING PINPOINT TEST DIAGNOSTICS TO DIRECTLY ACCESS THE VEHICLE THROUGH A VEHICLE COMMUNICATIONS MODULE (VCM), DISPLAY TEST MEASUREMENTS IN REAL TIME AND PROVIDE LOGICAL DIAGNOSTIC PROGRESSION BASED ON TECHNICIAN INPUT. NOTE: IF DIAGNOSTIC TROUBLE CODES ARE PRESENT, DO NOT CLEAR THE CODES UNTIL USING INTERACTIVE DIAGNOSIS, THIS WILL HELP CAPTURE 'FREEZE FRAME' DATA DURING THE DIAGNOSTICS OF ANY DTC. Effective Date: 06/06/2009	1 out of 1 303000
SSM: 20903 2010 FUSION/MILAN/MKZ, FUSION/MILAN HYBRID - REMOVAL AND INSTALLATION OFINSTRUMENT PANEL REINFORCEMENT PLATE. - SERVICE TIP 2010 FUSION/MILAN/MKZ AND FUSION/MILAN HYBRID, BUILT PRIOR TO 06/25/2009 WHERE REMOVAL AND REINSTALLATION OF INSTRUMENT PANEL REINFORCEMENT PLATE (BASE PART NUMBER 54017A28) IS NECESSARY, MAKE SURE TO USE HAND TOOLS TO REMOVE ANY FASTENERS AND FOLLOW WORKSHOP MANUAL SECTION 211-04. WHEN REINSTALLING THE FASTENERS, MAKE SURE TO ONLY APPLY 47 LB-IN (5.4NM) OF MAXIMUM TORQUE. FAILURE TO USE HAND TOOLS AND FOLLOW WSM SECTION 211-04 MAY DAMAGE THE INSTRUMENT PANEL RETAINER CLIPS AND/OR INSTRUMENT PANEL SURFACES. IF DAMAGE TO THESE COMPONENTS IS PRESENT, PROCEED WITH NORMAL SERVICE REPAIRS AND REFER TO FORD CATALOG FOR THE LATEST AND GREATEST SERVICE PART AVAILABILITY. N/A	No DTCs to report	

Historic DTCs {retrieved 24 September 2009 12:05:05}

DTC	Description / Action	Source
P07AE:09	Transmission Friction Element G Performance/Stuck Off: Component failure **Description:** The PSCM will monitor the amount of force needed to assist with vehicle steering when the ignition is ON and the voltage supply to the PSCM is above 6 volts, all other EPAS sensors are functioning correctly and the EPAS gear is providing assist. • DTC P07AE:09 (Transmission Friction Element G Performance/Stuck Off: Component Failure) - If the amount of friction in the steering system exceeds the allowable threshold, DTC P07AE:09 will be set. Low air pressure in the tires could cause DTC P07AE:09 to set. **Possible Causes:** • Low tire air pressure. • Damaged steering gear bellows boot • Contaminated gear/rack. • Inner tie rods • Steering gear internal failure. **Diagnostic Aids:** During the ignition cycle when the DTC was set the following will happen: steering assist will be reduced, the PSCM will transmit an invalid steering angle message over the HS-CAN bus and the module will also send a message to the IPC to display the SERVICE POWER STEERING message in the message center. During the very next ignition cycle after the DTC was set the following will happen: the PSCM will remove steering assist and enter into a manual mode, the module will transmit an invalid steering angle message over the HS-CAN bus and the module will also send a message to the IPC to display the SERVICE POWER STEERING NOW message in the message center. **Action:** GO to Pinpoint Test F	PSCM

DTCs cleared since initial read:

DTC P07AE:09 (PSCM) - Transmission Friction Element G Performance/Stuck Off: Component failure

---

F: DTC P07AE: Transmission Friction Element G Performance/Stuck Off - Component Failure

Normal Operation

The power steering control module (PSCM) monitors various inputs and outputs of the electronic power assist steering (EPAS) system in order to keep the system operating at peak capacity. Information provided by sensors (steering torque, vehicle speed, vehicle travel distance, etc.) are all compared to programmed and learned information. Likewise, outputs like the motor and steering rack (travel) are tested against programmed and learned information.

Note:

The smart junction box (SJB) is also identified as the generic electronic module (GEM).

F1: MONITOR THE SJB LEFT FRONT TIRE PRESSURE (LF_PRES) AND RIGHT FRONT TIRE PRESSURE (RF_PRES) PIDS

- Ignition ON, engine OFF.
- Access the GEM_SJB and monitor the LF_PRES PID. Stored Value: 29.4 psi
- Access the GEM_SJB and monitor the RF_PRES PID. Stored Value: 29.9 psi
- Compare the PID readings to the information on the vehicle certification (VC) label.
- **Is the air pressure in the tires correct as indicated on the VC label?**

Yes
Go to F2.

F2: CHECK FOR UNLOADED STEERING RACK TRAVEL FEEL.

- With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02.
- Ignition OFF.
- Raise the vehicle until the front wheels no longer touch the ground.
- Rotate the steering wheel from lock-to-lock and inspect the steering rack travel for the following:
  —Abnormal noises
  —Rough spots
  —Sticky spots
  —Tight spots
- **Is steering rack travel smooth and free of any abnormal noises, rough, sticky and tight spots?**

Yes
Go to F4.

F4: TEST DRIVE TO CHECK FOR RETURNING DTCS. - Fault outcome

-
- Cycle the ignition to OFF and then back to RUN.

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

- Test drive the vehicle in the following manner:
  —With the engine running/ready, stop the vehicle on an unsealed concrete or asphalt surface (in order to provide adequate friction for a thorough test).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.
  —Return the steering wheel to the center position and move the vehicle forward approximately 32 cm (1 ft).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.
  —Return the steering wheel to the center position and move the vehicle forward approximately 32 cm (1 ft).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.

NOTE: The next portion of the test drive will require the vehicle to be driven at highway speeds.

NOTE: The test period is a cumulative time of 10 minutes. Stopping, going slower than 72 km/h (45 mph) or faster that 96 km/h (60

PE14-030 000083

mph) will not affect the test as long as a total time of 10 minutes is spent between 72-96 km/h (45-60 mph) with at least 4 lane changes during that time/speed window.

- Continue test driving the vehicle in the following manner:
  —Bring the vehicle to a minimum speed of 72 km/h (45 mph), maximum of 96 km/h (60 mph).
  —Maintain that speed for at least 10 minutes.
  —During this 10-minute time period, make a minimum of 4 lane changes or turns that achieve a steering wheel angle of at least 20 degrees.
  —The test drive is complete.
- Press Read Vehicle Information button to retrieve DTC s from the vehicle. NOTE: DTCs may be displayed from previous diagnostic actions.

Subject: FR0123 TS damage
Attachments: FR0123 - Damaged TS harness.pdf; EPAS Gear 001.jpg; EPAS Gear 002.jpg; EPAS Gear 003.jpg; EPAS Gear 004.jpg; EPAS Gear 005.jpg; EPAS Gear 006.jpg

This is one we did not have time for in yesterday's TS meeting but not sure if we can close this out since the dealer cut-out the evidence of a damaged TS harness. See attachments for pics & the interactive diagnosis. Vehicle was not in a wreck or had other repairs only came in for this complaint and the vehicle has 22k miles so unsure how this TS harness was damaged.

OASIS symptom code:
— Chassis \ Steering/Handling (303000)

- OASIS will return known TSB s and SSMs for the specific symptom code(s) and DTC(s) listed above.

Recent Warranty Repair History: No recent repair history on vehicle

Review the OASIS results below for any known concerns related to the current vehicle.

TSB: 09-12-13 FUSION/MILAN HYBRID - CHANGE IN BRAKE PEDAL TRAVEL AND/OR ABS CONTROL/BRAKEWARNING LAMP - DTC C1011:1C, C1011:1F OR C100A:64 - BUILT ON OR BEFORE 5/15/2009 SOME 2010 FUSION AND MILAN HYBRID (HEV) VEHICLES MAY EXPERIENCE ELECTRONIC NOISEON THE MAIN POWER FEED CIRCUIT TO THE BRAKE CONTROL MODULE WITHIN THE 14290WIRING HARNESS. DEPENDING ON THE FREQUENCY AND DURATION OF THE NOISE IT MAYGENERATE A FALSE DIAGNOSTIC TROUBLE CODE (DTC) (C1011-1C, C1011-1F, OR C100A-64)IN THE BRAKE MODULE. THIS TURNS OFF THE BRAKE BY WIRE MODE, DEFAULTING TO DIRECTPEDAL ACTIVATION OF THE BRAKE SYSTEM, INCLUDING FULL VACUUM BRAKE ASSIST. SEETHE TSB FOR DETAILS AND FOLLOW SERVICE PROCEDURE STEPS TO CORRECT THE CONDITION. See TSB for complete details: Effective Date: 06/12/2009	1 out of 4 303000
SSM: 20782 2008- 2010 FUSION, MILAN, MKZ - NO LONGER INCLUDE THE STEERING WHEEL LOCKFEATURE. ALL 2008 - 2010 FUSION, MILAN, AND MKZ VEHICLES BUILT AFTER 12/1/2007 HAVE INCORPORATED AN ELECTRONIC PASSIVE ANTI-THEFT SYSTEM (EPATS) KEY SYSTEM FOR THEFT PROTECTION AND REPLACING THE MECHANICAL STEERING WHEEL LOCK FEATURE THEFT PROTECTION. IMPORTANT: DO NOT REPLACE THE STEERING COLUMN FROM A	1 out of 4 303000

PE14-030 000101

PRE-12/1/2007 BUILT VEHICLE WITH THE NEW EPATS EQUIPPED COLUMN. THE COLUMNS ARE NOT INTERCHANGEABLE. A DEALER THAT INTERCHANGES THE COLUMNS COULD BE SUBJECT TO GOVERNMENT FINES UP TO $6,000 PER VEHICLE FOR RENDERING INOPERATIVE A REQUIRED SAFETY FEATURE.
Effective Date: 05/06/2009

SSM: 20795 2010 FUSION/MILAN - 2.5L/3.0L EPAS EQUIPPED VEHICLES - SQUEAK AND RATTLE — 1 out of 4 303000

SOME 2010 FUSION/MILAN EQUIPPED WITH 2.5L OR 3.0L AND ELECTRONIC POWER ASSIST STEERING (EPAS) MAY EXHIBIT INCREASED LEVELS OF ROAD NOISE, THAT CAN BE HEARD INSIDE THE VEHICLE WHILE DRIVING. THE STEERING GEAR/DASH SEAL -(BASE PART NUMBER 3611B) MAY NOT BE PROPERLY SEATED. THE CORRECT POSITION OF THE STEERING GEAR/DASH SEAL CAN FOUND IN WORKSHOP MANUAL SECTION 211-02. NOTE: THIS ROAD NOISE DOES NOT IMPACT THE FUNCTION OR DURABILITY OF THE STEERING SYSTEM AND IT IS CONSIDERED A CUSTOMER IRRITATION.
Effective Date: 05/14/2009

SSM: 20903 2010 FUSION/MILAN/MKZ, FUSION/MILAN HYBRID - REMOVAL AND INSTALLATION OFINSTRUMENT PANEL REINFORCEMENT PLATE. - SERVICE TIP — 1 out of 4 303000

2010 FUSION/MILAN/MKZ AND FUSION/MILAN HYBRID, BUILT PRIOR TO 06/25/2009 WHERE REMOVAL AND REINSTALLATION OF INSTRUMENT PANEL REINFORCEMENT PLATE (BASE PART NUMBER 54017A28) IS NECESSARY, MAKE SURE TO USE HAND TOOLS TO REMOVE ANY FASTENERS AND FOLLOW WORKSHOP MANUAL SECTION 211-04. WHEN REINSTALLING THE FASTENERS, MAKE SURE TO ONLY APPLY 47 LB-IN (5.4NM) OF MAXIMUM TORQUE. FAILURE TO USE HAND TOOLS AND FOLLOW WSM SECTION 211-04 MAY DAMAGE THE INSTRUMENT PANEL RETAINER CLIPS AND/OR INSTRUMENT PANEL SURFACES. IF DAMAGE TO THESE COMPONENTS IS PRESENT, PROCEED WITH NORMAL SERVICE REPAIRS AND REFER TO FORD CATALOG FOR THE LATEST AND GREATEST SERVICE PART AVAILABILITY.
Effective Date: 07/23/2009

SSM: 21110 2010 FUSION/MILAN, TAURUS/MKS, FLEX/MKT - UPDATED ELECTRONIC POWER ASSIST SYSTEM (EPAS) - INTERACTIVE DIAGNOSIS - — 1 out of 4 303000

THE 2010 FUSION/MILAN/TAURUS/MKT WORKSHOP MANUAL SECTION 211-00A HAS BEEN UPDATED WITH INTERACTIVE DIAGNOSTICS. THIS SECTION PROVIDES NEW INFORMATION ABOUT DIAGNOSTIC TOOLS FOR THE ELECTRONIC POWER ASSIST STEERING (EPAS) AND THE POWER STEERING CONTROL MODULE (PSCM). THIS NEXT GENERATION OF VEHICLE DIAGNOSTIC SOFTWARE IS DESIGNED TO AID TECHNICIANS IN IDENTIFYING VEHICLE CONCERNS BY ALLOWING PINPOINT TEST DIAGNOSTICS TO DIRECTLY ACCESS THE VEHICLE THROUGH A VEHICLE COMMUNICATIONS MODULE (VCM), DISPLAY TEST MEASUREMENTS IN REAL TIME AND PROVIDE LOGICAL DIAGNOSTIC PROGRESSION BASED ON TECHNICIAN INPUT. NOTE: IF DIAGNOSTIC TROUBLE CODES ARE PRESENT, DO NOT CLEAR THE CODES UNTIL USING INTERACTIVE DIAGNOSIS, THIS WILL HELP CAPTURE 'FREEZE FRAME' DATA DURING THE DIAGNOSTICS OF ANY DTC.
Effective Date: 11/25/2009

PSCM - Power Steering Control Module(DTCs Present)
Historic CMDTCs(3 DTCs) (28 December 2009 09:43:35)

DTC	Description / Action
U3000:96	Control Module: Component Internal Failure **Description:** The PSCM is self monitoring and will carry out self-tests at specific intervals (initial power up, power down, during normal operation, etc.). Each self-test requires the voltage supply to the PSCM to be at or above a specific level (above 6 volts, above 9 volts, between 10 and 17 volts, etc.) for the test to take place. If one or more of the self-tests should fail, then the module will set one or more DTCs. • DTC U3000:41 (Control Module: General Checksum Failure) - If at any time during normal operation the module detects an internal software error with more than 6 volts supplied to the PSCM, then DTC U3000:41 will be set. • DTC U3000:46 (Control Module: Calibration/Parameter Memory Failure) - At any time during normal operation with more than 6 volts supplied to the PSCM the module determines that one or more calibration files are missing or that they are corrupt or that the incorrect EPAS gear is installed on the vehicle, then DTC U3000:46 will be set . • DTC U3000:49 (Control Module: Internal Electronic Failure) - If at any time during normal operation with more than 6 volts supplied to the PSCM, the module detects a software or internal hardware error then the DTC U3000:49 will be set. • DTC U3000:61 (Control Module Signal Calculation Failure) - If the PSCM detects that assist torque calculation is faulty due to a software failure in the module, then DTC U3000:61 will be set. • DTC U3000:72 (Control Module Actuator Stuck Open) - During initial power up with voltage greater than 9 volts, the PSCM will check the internal relay for voltage. If voltage is not present the module will make several attempts to close the relay. If the voltage remains undetected after this test period, then DTC U3000:72 will be set. • DTC U3000:96 (Control Module: Component Internal Failure) - This DTC will set if there is an internal failure of the PSCM due to temperature, power supply or if multiple failures have occurred over a short period of time. **Possible Causes:** • Heat shield missing. • Steering gear internal failure. • Incorrect EPAS gear installed. • Ice/frost build up on relay contacts. • Heavy loads on the EPAS gear. • Excessive ambient temperatures. **Diagnostic Aids:** For DTC U3000:41, the PSCM will remove steering assist, enter into a manual mode and transmit an invalid steering angle message over the HS-CAN bus. The module will also send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:46, initially the PSCM will use a default steering assist and may set DTC U2100:00. If DTC U3000:46 returns on the next ignition cycle, then the PSCM will remove steering assist, enter into a manual mode and send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:49, the presence of this DTC may or may not affect steering assist. It will depend on what other DTCs (if any) are set along with U3000:49. Diagnose all other DTCs before diagnosing U3000:49. For DTC U3000:61, the PSCM will remove steering assist, enter into a manual mode and transmit an invalid steering angle message over the HS-CAN bus. The PSCM will also send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:72, this DTC indicates that a specific internal relay is either stuck open or has excessive resistance. In cold climates or climates where frost is possible, the relay contacts could develop a layer of frost which may prevent a clean connection between the relay contacts. It may be necessary to allow the vehicle to remain outside overnight in a cold climate to duplicate the DTC trigger conditions. If U3000:72 sets again on subsequent ignition cycles, then the PSCM will remove steering assist, enter into a manual mode and send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. • For DTC U3000:96, the instrument cluster will display the POWER STEERING ASSIST FAULT in the message center when this DTC is set

DTC U3000:96 (PSCM) - Control Module: Component Internal Failure

C: DTC U3000: Control Module - Signal Calculation Failure and Component Internal Failure

Normal Operation

The power steering control module (PSCM) monitors various inputs and outputs of the electronic power assist steering (EPAS) system in order to keep the system operating at peak capacity. Information provided by sensors (steering torque, vehicle speed, vehicle travel distance, etc.) are all compared to programmed and learned information. Likewise, outputs like the motor and steering rack (travel) are tested against programmed and learned information.

Note:

If a damaged bellows boot(s) was discovered during Inspection and Verification and this pinpoint test DOES NOT lead to the installation of a new EPAS gear or bellows boot(s), then go to Pinpoint Test K to address the damaged boot(s) before returning the vehicle to the customer.

C1: CHECK PSCM DTCS. - Fault outcome

- Review the returned PSCM DTCs.
- **Is DTC U3000:96 present?**

Yes
INSTALL a new EPAS gear. REFER to Section 211-02.

Exit: Mon Dec 28 13:25:38 EST 2009

Subject: B9A Issue

Tim,
In the B9A meeting the issue regarding the history of the ground strap implementation and cap strap implementation and on which programs and time frame they were implemented was questioned. I did not have the full background.

Can you please provide me with a brief summary of the programs which had these fixes implemented and when they were implemented? Maybe you have a matrix already?

Subject: FW: B9A SW fix Timing for CD3/D3/U502 Current Production
Attachments: Microsoft Project - Timing for B9A .pdf

JC,

Based off Rob's timing, when would PPAP parts arrive at Hermosillo? Are you putting a timing plan together? And, could TRW support Job 2 TT on Sept 27. Looks like it. I'm thinking we do this change for 2011 Job 2, support TT build, and then, since this is a quality fix, implement for production after TT build. Which also means Hermosillo EOL would have to accommodate the pulled ahead Job 2 software part numbers.

Regards,

Rob,

The B3a (FR-0098) was an offset bridge. The gear was built on Sept 26th, 2009 which was before the 100 % Laredo X-ray came on-line, but after Hot Puma Activation testing started. The 100 % x-ray came on-line the week of Oct 1st, but I am working on getting the exact date of the first clean shipment.

Mike

Great news on finding some parts and having some info about root cause.
Now, need clean cutoff/ICA and PCA for the error states identified to date.

Subject: RE: EPAS Quality Issue

We have a TRW review with Bennie coming up. Their VPs are coming in, just FYI. Multiple steering issues on agenda, not just Explorer.

The status of B9A codes for Explorer (and Re , CD3, and C346):
- One warranty return part found with contamination in Hall effect sensor causing a short.
- TRW is tearing down other warranty return parts looking for similar contamination in the same region.
- This contamination is at the microscopic level in an IC, so difficult to find (scan with a microscope looking for debris).
- TRW is also at the IC maker confirming clean room procedures are being properly followed.

- One warranty return part repeated yesterday on a vehicle
- Vehicle was instrumented when the fault occurred and issue was captured with data logger
- Problem was with the encoder, not the hall effect.
- TRW is tearing down part now to determine encoder issue

Both of the above are encouraging progress in finding root cause, and key in moving us forward. We should have more later this week.

Thanks

Subject: FR0074

Hello Martha
In a call with Tim Diez today, we were discussing the 8D which will be raised for FR0074. This is the motor PCB relayout which Nidec is addressing.
Tim has requested that we include in the 8D that as part of the section 7 in the document, we include an action that the PCB design rules are updated to consider such tolerance overlap situations between component legs and pcb layers.
I will try to ensure this is done, but as you are the supplier of the 8D to Ford (and your memory is younger than mine) please can you make a note of this so we do not overlook it at the appropriate time.

Thanks
Mike

Attachments: #7 gear warranty return data.pdf

It looks like we have a vehicle at a local dealer in Garden City at Metropolitan Lincoln-Mercury setting codes U2011-49 & U3000-96(C69).

I don't know if we are interested in getting this gear? Greg do we have any gears available for service?

Let me know if we want to go out and check this vehicle out today or tomorrow.

EPAS

Current DTCs {retrieved 9 June 2009 09:15:41}

DTC	Description / Action	Source
N/A	No DTCs to report	

Historic DTCs {retrieved 9 June 2009 09:15:41}

DTC	Description / Action	Source
U3000:96	Control Module: Component Internal Failure **Description:** The PSCM is self monitoring and will carry out self-tests at specific intervals (initial power up, power down, during normal operation, etc.). Each self-test requires the voltage supply to the PSCM to be at or above a specific level (above 6 volts, above 9 volts, between 10 and 17 volts, etc.) for the test to take place. If one or more of the self-tests should fail, then the module will set one or more DTCs. • DTC U3000:41 (Control Module: General Checksum Failure) - If at any time during normal operation the module detects an internal software error with more than 6 volts supplied to the PSCM, then DTC U3000:41 will be set. • DTC U3000:46 (Control Module: Calibration/Parameter Memory Failure) - At any time during normal operation with more than 6 volts supplied to the PSCM the module determines that one or more calibration files are missing or that they are corrupt or that the incorrect EPAS gear is installed on the vehicle, then DTC U3000:46 will be set . • DTC U3000:49 (Control Module: Internal Electronic Failure) - If at any time during normal operation with more than 6 volts supplied to the PSCM, the module detects a software or internal hardware error then the DTC U3000:49 will be set. • DTC U3000:61 (Control Module Signal Calculation Failure) - If the PSCM detects that assist torque calculation is faulty due to a software failure in the module, then DTC U3000:61 will be set. • DTC U3000:72 (Control Module Actuator Stuck Open) - During initial power up with voltage greater than 9 volts, the PSCM will check the internal relay for voltage. If voltage is not present the module will make several attempts to close the relay. If the voltage remains undetected after this test period, then DTC U3000:72 will be set. • DTC U3000:96 (Control Module: Component Internal Failure) - This DTC will set if there is an internal failure of the PSCM due to temperature, power supply or if multiple failures have occurred over a short period of time. **Possible Causes:** • Heat shield missing. • Steering gear internal failure. • Incorrect EPAS gear installed. • Ice/frost build up on relay contacts. • Heavy loads on the EPAS gear. • Excessive ambient temperatures. **Diagnostic Aids:** For DTC U3000:41, the PSCM will remove steering assist, enter into a manual mode and transmit an invalid steering angle message over the HS-CAN bus. The module will also send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:46, initially the PSCM will use a default steering assist and may set DTC U2100:00. If DTC U3000:46 returns on the next ignition cycle, then the PSCM will remove steering assist, enter into a manual mode and send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:49, the presence of this DTC may or may not affect steering assist. It will depend on what other DTCs (if any) are set along with U3000:49. Diagnose all other DTCs before diagnosing U3000:49. For DTC U3000:61, the PSCM will remove steering assist, enter into a manual mode and transmit an invalid steering angle message over the HS-CAN bus. The PSCM will also send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:72, this DTC indicates that a specific internal relay is either stuck open or has excessive resistance. In cold climates or climates where frost is possible, the relay contacts could develop a layer of frost which may prevent a clean connection between the relay contacts. It may be necessary to allow the vehicle to remain outside overnight in a cold climate to duplicate the DTC trigger conditions. If U3000:72 sets again on subsequent ignition cycles, then the PSCM will remove steering assist, enter into a manual mode and send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:96, the presence of this DTC may or may not affect steering assist. It will depend on what other DTCs are set along with U3000:96. If steering assist is affected the PSCM will send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. **Action:** GO to Pinpoint Test C.	PSCM

DTC U3000:96 (PSCM) - Control Module: Component Internal Failure

C: DTC U3000: Control Module - Signal Calculation Failure and Component Internal Failure

Normal Operation

The power steering control module (PSCM) monitors various inputs and outputs of the electronic power assist steering (EPAS) system in order to keep the system operating at peak capacity. Information provided by sensors (steering torque, vehicle speed, vehicle travel distance, etc.) are all compared to programmed and learned information. Likewise, outputs like the motor and steering rack (travel) are tested against programmed and learned information.

Note:

If a damaged bellows boot(s) was discovered during Inspection and Verification and this pinpoint test DOES NOT lead to the installation of a new EPAS gear or bellows boot(s), then go to Pinpoint Test K to address the damaged boot(s) before returning the vehicle to the customer.

C1: VERIFY PRESENCE OF EPAS GEAR HEAT SHIELD

- Make sure the EPAS gear heat shield is present and installed correctly. Refer to Section 211-02.
- **Is the heat shield present and is it installed correctly?**

Yes
Go to C2.

Start: Tue Jun 9 09:13:00 EDT 2009

Menu Selection: Inspection and Verification

IV1: Inspection and Verification

- Verify the customer concern.
- Visually inspect the electronic power assist steering (EPAS) system for obvious signs of mechanical or electrical damage.

  NOTE: When inspecting the bellows boots make sure to use a strong light source and an inspection mirror.

VISUAL INSPECTION CHART

Mechanical	Electrical
Binding or misaligned steering column.	Battery junction box (BJB) fuses 1 (50A) and 2 (50A)
Loose steering column shaft bolts.	Smart junction box (SJB) fuse 42 (10A)
Steering column shaft couplings/U-joints	Wiring, terminals or connectors.
Steering gear	
Steering gear bellows boots	
Inner tie-rod ends	
Outer tie-rod ends	
Tire pressure	
Tires	

- **Is an obvious cause for an observed or reported concern found?**

Yes	No
For damaged steering gear bellows boots. Go to IV2. For all others, Click for details.	**Go to Known Concerns**

DTC	Description / Action	Source
N/A	No DTCs to report	

Historic DTCs {retrieved 9 June 2009 09:15:41}

DTC	Description / Action	Source
U3000:96	Control Module: Component Internal Failure **Description:** The PSCM is self monitoring and will carry out self-tests at specific intervals (initial power up, power down, during normal operation, etc.). Each self-test requires the voltage supply to the PSCM to be at or above a specific level (above 6 volts, above 9 volts, between 10 and 17 volts, etc.) for the test to take place. If one or more of the self-tests should fail, then the module will set one or more DTCs. • DTC U3000:41 (Control Module: General Checksum Failure) - If at any time during normal operation the module detects an internal software error with more than 6 volts supplied to the PSCM, then DTC U3000:41 will be set. • DTC U3000:46 (Control Module: Calibration/Parameter Memory Failure) - At any time during normal operation with more than 6 volts supplied to the PSCM the module determines that one or more calibration files are missing or that they are corrupt or that the incorrect EPAS gear is installed on the vehicle, then DTC U3000:46 will be set . • DTC U3000:49 (Control Module: Internal Electronic Failure) - If at any time during normal operation with more than 6 volts supplied to the PSCM, the module detects a software or internal hardware error then the DTC U3000:49 will be set. • DTC U3000:61 (Control Module Signal Calculation Failure) - If the PSCM detects that assist torque calculation is faulty due to a software failure in the module, then DTC U3000:61 will be set. • DTC U3000:72 (Control Module Actuator Stuck Open) - During initial power up with voltage greater than 9 volts, the PSCM will check the internal relay for voltage. If voltage is not present the module will make several attempts to close the relay. If the voltage remains undetected after this test period, then DTC U3000:72 will be set. • DTC U3000:96 (Control Module: Component Internal Failure) - This DTC will set if there is an internal failure of the PSCM due to temperature, power supply or if multiple failures have occurred over a short period of time. **Possible Causes:** • Heat shield missing. • Steering gear internal failure. • Incorrect EPAS gear installed. • Ice/frost build up on relay contacts. • Heavy loads on the EPAS gear. • Excessive ambient temperatures. **Diagnostic Aids:** For DTC U3000:41, the PSCM will remove steering assist, enter into a manual mode and transmit an invalid steering angle message over the HS-CAN bus. The module will also send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:46, initially the PSCM will use a default steering assist and may set DTC U2100:00. If DTC U3000:46 returns on the next ignition cycle, then the PSCM will remove steering assist, enter into a manual mode and send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:49, the presence of this DTC may or may not affect steering assist. It will depend on what other DTCs (if any) are set along with U3000:49. Diagnose all other DTCs before diagnosing U3000:49. For DTC U3000:61, the PSCM will remove steering assist, enter into a manual mode and transmit an invalid steering angle message over the HS-CAN bus. The PSCM will also send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:72, this DTC indicates that a specific internal relay is either stuck open or has excessive resistance. In cold climates or climates where frost is possible, the relay contacts could develop a layer of frost which may prevent a clean connection between the relay contacts. It may be necessary to allow the vehicle to remain outside overnight in a cold climate to duplicate the DTC trigger conditions. If U3000:72 sets again on subsequent ignition cycles, then the PSCM will remove steering assist, enter into a manual mode and send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. For DTC U3000:96, the presence of this DTC may or may not affect steering assist. It will depend on what other DTCs are set along with U3000:96. If steering assist is affected the PSCM will send a message to the instrument cluster to display the POWER STEERING ASSIST FAULT message in the message center. **Action:** GO to Pinpoint Test C.	PSCM

DTC U3000:96 (PSCM) - Control Module: Component Internal Failure

C: DTC U3000: Control Module - Signal Calculation Failure and Component Internal Failure

Normal Operation

The power steering control module (PSCM) monitors various inputs and outputs of the electronic power assist steering (EPAS) system in order to keep the system operating at peak capacity. Information provided by sensors (steering torque, vehicle speed, vehicle travel distance, etc.) are all compared to programmed and learned information. Likewise, outputs like the motor and steering rack (travel) are tested against programmed and learned information.

Note:

If a damaged bellows boot(s) was discovered during Inspection and Verification and this pinpoint test DOES NOT lead to the installation of a new EPAS gear or bellows boot(s), then go to Pinpoint Test K to address the damaged boot(s) before returning the vehicle to the customer.

C1: VERIFY PRESENCE OF EPAS GEAR HEAT SHIELD

- Make sure the EPAS gear heat shield is present and installed correctly. Refer to Section 211-02.
- **Is the heat shield present and is it installed correctly?**

Yes
Go to C2.

C2: TEST DRIVE TO CHECK FOR RETURNING DTCS. - Fault outcome

-
- Cycle the ignition to OFF and then back to RUN.

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

- Test drive the vehicle in the following manner:
  —With the engine running/ready, stop the vehicle on an unsealed concrete or asphalt surface (in order to provide adequate friction for a thorough test).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.
  —Return the steering wheel to the center position and move the vehicle forward approximately 32 cm (1 ft).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.
  —Return the steering wheel to the center position and move the vehicle forward approximately 32 cm (1 ft).
  —With the vehicle in gear and the brakes applied, turn the steering wheel lock-to-lock.

NOTE: The next portion of the test drive will require the vehicle to be driven at highway speeds.

NOTE: The test period is a cumulative time of 10 minutes. Stopping, going slower than 72 km/h (45 mph) or faster that 96 km/h (60 mph) will not affect the test as long as a total time of 10 minutes is spent between 72-96 km/h (45-60 mph) with at least 4 lane changes during that time/speed window.

- Continue test driving the vehicle in the following manner:
  —Bring the vehicle to a minimum speed of 72 km/h (45 mph), maximum of 96 km/h (60 mph).
  —Maintain that speed for at least 10 minutes.
  —During this 10-minute time period, make a minimum of 4 lane changes or turns that achieve a steering wheel angle of at least 20 degrees.
  —The test drive is complete.
- Press Read Vehicle Information button to retrieve DTC s from the vehicle. NOTE: DTCs may be displayed from previous diagnostic actions.

Subject: Nidec Motor

Ron,
My name is Alan Pienta. I am with Ford Motor Company and work with Tim Diez in Chassis Electronics on TRW EPAS programs.

Tim and I were discussing the Nidec 150K capacity increase and recent issues arising with the B9A fault code. We would like to know how Nidec validates their magnetization process and untimately the flux density of the magnets used. Is the process a significant characteristic? Do you know if anything has changed in the process with the capacity increase such as change in sub suppliers, etc.?

Regarding the SREA, do you know what validation was completed and when? Can you forward the results to me or let me know who has the data?

Thanks,
Alan Pienta

Battery loss

SSM could have helped

Rear strut wiring - no EFF codes/clears

gear not avail - no on-line data

gear not equal - no on-line data

2 raised rivet - mis binned

867 EPAS issue, no root cause yet

2 NPF, no codes, angle offset invalid

Suspect connector - SSM

NO B Codes, A16 code - can mute fault could be bad connector

SSM

reverse capacitor - valid epas issue

B32 code - cannot reproduce fault

C1278, no EPAS code NPF

NPF

10 claims:

2 gears not rec'd, no on-line data

3 loose connector. suspicious - SSM to help

4 valid EPAS issues → mis binned

1 new issue need to pick up part @ WPAC

10

Next Steps:

1. Meeting w/ warranty engineer, technician, improvements
2. Look @ wire harnesses for this connector
3. Speak to tech writing team re: adding DTC to applicable DTC
4. Work w/ tech PST on connector robustness

Subject: #6 warranty gear U2011-49

Jose can you confirm that the code U2011 did not reset after the cold start. I don't know if the dealer ordered the gear because of the previous reports with the hotline or if the code cameback after the cold start. The parts registry shows an EPAS gear being delivered to this dealer today.

Guillermo,

Okay. Have you noticed any groupings in the B9A warranty returns regarding date of manufacture of the motor, or module? The vehicle builds with B9A's appear to be spread out between Feb 2009 and Sept 2009.

Subject: 150 EPAS on hold release / TRW

Tim,

As per the lack of any other possible containment to be performed as a gear level to the 150 pieces we have on hold at Benteler, we agreed this afternoon with Fernando, to start releasing the parts in lots of 10 pc./day, to closely track them down through the line, and perform a driving test that Fer suggested. As mentioned during the week, we feel very optimistic that parts will perform perfectly as per the rest of the julian date lot, basing our selves in the Bully results we have for the material.

In relation to it, we agree to proceed with this activity. We'll be supporting as agreed to control every 10 pc. lot that is assembled at Benteler and then shipped into the assembly line; Angel will be coordinating this activity and informing Fernando about the VIN numbers for your follow up.

Thanks for your support.

Guillermo Aguilar,

I overnighted the part but unsure if when the dealer is going to close the repair order so hopefully end of this week or early next week.

I'm trying to get a meeting number so once I get that I will set up the meeting.

Subject: RE: 2010 CD3 EPAS First Service Return
Importance: High

Good Morning Bill,

This morning we were reviewing the request regarding GCQIS Report # 9DIAI062. Please review the background of this program and/or new issues:

+ Report # 9DIAI062 in this E-mail is incomplete.
For the latest information and most current GCQIS data please refer to:
http://www.seo.ford.com/gcqis/cqis/decider.htm
https://www.gcqis.dealerconnection.com/gcqis/asp/WBRES_RptSummaryUpdMain.asp?rptnbr=9DIAI062

+ Supplier requests to contact Dealers, (Service/Parts) Department for EPAS follow up:
Currently, under current ford guidelines, no supplier can contact the Dealer for repairs, parts and/or follow-ups directly.

Supplier must work/follow through ford point of contact.

+ Current Point of Contact for Ford Dealers regarding EPAS is:
Jose C.

+ Status of GCQIS Report # 9DIAI062 the dealer has not completed all the diagnosis.
Jose C. to follow up with dealer on diagnosis and/or repairs once completed.

+ If a request for a part is needed. Requester (D&R) needs to follow WPRC guidelines:
http://www.quality.ford.com/6sigma_center/wpac/index.html

If you have any questions, please set up a meeting and we can discuss next steps.

Regards,

José Chacón
Product Concern Engineer

Subject: RE: 2010 CD3 EPAS First Service Return

Eric/José, can you two please clarify what the actual fault codes were in the vehicle for the PSCM? The DTCs in Eric's note does not match the text from the CQIS case. It also states the report at the bottom that the car was connected to the IDS tool and if that is the case we should know a lot about this car and it seems we do not. So between the two of you can you please get the information needed so that we can react accordingly.

Thanks

Bill Bouse

Subject: 2010 CD3 EPAS First Service Return

I have some concerns with the lack of assistance FCSD is giving me to contact the dealers. All my information to the dealers need to go through Jose Chacon (product concern engineer) to get information. I contacted Jose this morning and advised that a gear was ordered from the dealer below but the dealer did not perform the new Interactive Online diagnosis to properly get detailed information like the diagnostic's, freeze-frame data and returning codes , so Jose wrote the CQIS case (see below).

This vehicle does not have any assist off the car hauler and from the report below not sure what codes are from other modules other than the EPAS U3000-49(0xF00049) & U3000-96(0xF00096) and what codes are current & history. I advised Jose that this dealer needs to hook up the IDS scan tool and follow the Interactive diagnosis so we can get the specific/one code that is causing the lack of assist.

Should get more detailed information on Monday so I can pull the TRW codes, also I will overnight the part back for fast analysis. I looked on the HSAP plant site and did not see any EPAS codes on this vehicle at the last "code check" stage.

Should get more detailed information on Monday so I can pull the TRW codes, also I will overnight the part back for fast analysis. I looked on the HSAP plant site and did not see any EPAS codes on this vehicle at the last "code check" stage.

Subject: RE: 2010 CD3 TC lamp on C1278,c1277 & C1963 ABS CODES

Good catch. Is there a reason we raise the ABS codes? Can we NOT raise them for this scenario? Or raise a DTC that tells the tech to service the wiring?

Subject: RE: 2010 CD3 TC lamp on C1278,c1277 & C1963 ABS CODES

Eric,

Please advise the hotline to inspect connector C1010 for possible intermittent connection if a CD3 EPAS vehicle has C1963 or C1277 or C1278 DTC's.

Subject: RE: 2010 CD3 TC lamp on C1278,c1277 & C1963 ABS CODES

I have seen many CQIS reports with this issue, make sure we write something up with connector number so I can sent out to the hotline here, this could turn into a SSM to prevent EPAS, ABS & RCM module replacements in the field. From my warranty pareto we have at 11 EPAS warranty claims, some of the other claims the tech states he has no assist with TC

lamp on c1278/C1277/c1263 but I did not find any b-codes and they did not mention problems with PSCM communication, so that number could be higher.

Subject: RE: C1278 & C1963 ABS CODES

Eric,

Russ and I recreated the C1963 and C1277 codes last night in a Brakes development vehicle by unhooking the EPAS jumper CAN connector underneath the front bumper for about a half second. No codes were recorded in the PSCM or other modules and steering assist remained, but C1963 and C1277 were recorded in the brake module. If we left the connector disconnected longer, say 5 seconds, then the PSCM showed a low battery code, steering assist was lost, and the service advance trac light came on in the cluster in addition to the C1963 and C1277. Once Russ sends the codes we can discuss next steps. I don't think any further vehicle evaluation is needed on these gears.

Eric

Previously provide gear from another return has been in my Milan for weeks now. No issues. If the team agrees to put a new rack in, we can do that next week.

Tim - I am unable to test on the Milan this week per our previous conversation. Hopefully we can do the connector terminal fault insertion next week.

Subject: RE: Updated TRW Warranty Tracker

Before we get defensive--Have we properly tested the returned part? Any chance it is actually bad?

What was the prior history of repair for the vehicle? Is there any reason the steering angle sensor would have been out of calibration? Were there any other DTC's that would have pointed to a connection issue? If the ABS DTC was the only one and there was no prior repair on the vehicle where a dealer may have failed to properly connect a wire or calibrate the sensor then my vote goes to paying the dealer. The dealer was obviously trying to do the right thing. They took the time to call hotline. Nothing makes them do that and we do not pay the dealer extra to do it.

Subject: RE: Updated TRW Warranty Tracker

Doesn't sound like the Hotline advised the dealer to replace the gear. Also, doesn't look like the pinpoint tests tell the technician to replace the gear. Seems like a legitimate dealer charge back.

Paul / Aaron,

Your thoughts?

Subject: RE: 2010 Fusion Milan Alleged Lack of Assist - EPAS

As an analyst in ASO, I review approx 150-200 reports per day for various chassis component repairs/failures. The sources for these reports include GCQIS, AWS, MORS/CuDL and VOQ (from NHTSA). If we (as a department) come across a concern that has a potential to be safety related, we discuss these emerging concerns with the Critical Concern Managers (CCM) and members of the CCRG during a weekly teleconference. Based on the discussion regarding an individual concern, we receive direction to either forward the data to the appropriate product development personnel for their review and possible discussion with the CCM or develop a formal paper that may be used to escalate a concern to the CCRG. In this particular instance, the request was to forward the data to you and Sergio for your review. I am not requesting you do anything with the data specifically, instead this may be more of an awareness issue as the average cost of repair exceeds $1500. There are some production months where the failure rate exceeds 1 R/1000 and since this vehicle/steering gear application is new for 2010 and the vehicles have relatively few miles/months in service on them, there are concerns that this issue could grow into something larger as the products mature in the field.

Subject: RE: 2010 Fusion Milan Alleged Lack of Assist - EPAS

All EPAS systems by design fail with lack of assist which is not a safety issue. CD3 failure rates are very low..... Approx 0.5Rs. We get every failed part back for root cause analysis and will continue to eliminate any/all failure modes.

Why was this discussed at ASO mtg?

Thx.

Subject: 2010 Fusion Milan Alleged Lack of Assist - EPAS

Sergio and Martin,

Attached to this email is an excel file containing AWS data regarding customers alleging lack of assist on 2010 Fusion/Milan vehicles equipped with EPAS.
This concern was discussed with Bharat Patel and members of ASO this morning (12/2) during a conference call with Bharat. At Bharat's request, I am forwarding this file to you for your review.

<< File: 2010 Fusion Milan Alleged lack of Assist EPAS AWS 11172009.xls >>

Call me if you have questions regarding the file.

Subject: RE: 8D B3A - Plastic contamination

Hi - The problem investigation has not gone far enough for return #2805. Tyco needs to determine if their detection method for contamination needs to change or if they need to do more destructive testing to confirm that they will not have this type of contamination in the future. If you make a part similar to 2805 today, the Tyco process would not detect the contamination and it would pass it on into the value stream.

Please use the 3 x 5 why tool to assist you with your root cause analysis (TRW has that tool). Please provide an updated 8D as soon as it is ready to Mike Davies, Geoff Jacks and Juan Miralles.

Thanks you.

Subject: RE: ABS lights on due to possible EPAS issue on CD3

I would like more time. I am not up to speed on the issue just coming back from vacation all last week and I am not too keen to be providing verbals in front of Ali. I would prefer to spend a week understanding the issue. My team is offsite all day tomorrow at TRW as well so that day is booked.

It really is too short a notice. Can we please move it a week?

Subject: RE: Another B3a just hit in IDS

I advised Earl to call the dealer back on this claim below because the code did not reset after clearing and the PPT leads to returning the vehicle to the customer. I advised to make sure the tech performed a parking lot road test and do a cold start if possible before returning the vehicle to the customer.
(Earl responded below)

He reported that he took the vehicle for a test drive and the code would not come back. He did add that the the customer was complaining of a intermittent hard start concern as well. there were no other codes and no aftermarket components. The battery is in good condition. He did do the parking lot test and a longer road test. He was going to let it sit over night to test the steering and the starting concern in the morning.

I told him not to replace the rack. Report number 9FBAK121

To: Adams, Renee (R.L.); Rossi, Roberto (R.A.); Bahena, Miguel (Mike.)
Subject: RE: B3A Investigation Status - Action Plan

Renee, the U2011-49 is the code that would be set for the TRW B3a diagnostic on the motor relay. You can pull the code with the Ford diagnostic tool by pulling the snapshot data (service 19) and putting in the U201149 and reading the last value of the returned data. Or you could directly read DID FDAA.

Also thanks for the link to report logiq.

Subject: RE: B3A Investigation Status - Action Plan

AR101831 failed Code Check for PSCM "DTC U2011-49 MTR" on Wed 2/18 at 12:11:57.
QLS system shows the vehicle was then penalized in PDI for "Steering Wheel Hard to Move" with a score of 70 (which is a major).

Is DTC U2011-49 the same as the B3A code? Is the B3A an internal code pulled by TRW? I did not see in the part 2 diag spec.

Hermosillo was just switched over from Qbay to Report Logiq, which is why Code Check does not show in in Qbay.

Quick update on gear updates from 3/3.

1050 gears were at HSAP (rattle fixed - green dot) that needed to be updated with J2 software (rattle fix and software fix combined - blue dot). We have updated 532 gears currently. We have 518 left for Wednesday AM. Rattle updates started at ~7pm today using blue does and be have begun clearing both the rattle and software OSMs. Plan is to have all gears updated prior to Tim's arrival and the beginning of flashing cars.

I will be in the 11am meeting in the morning any questions that you have please call me @ +521 662 169 0667 or 313-805-2289

Bill

Team,

Once the remaining 2000 cars on the lot and 107 cars on the line have been reflashed, we will be downloading all the data from the PUMA tools so we have a record of vehicles that have been successfully reflashed.

Thanks.

Subject: RE: B3A Investigation Status Update

Folks, quick update on progress at HSAP. Over 3700 vehicles have been completed as of 6am this morning. Should finish the re-flash later tonight hopefully prior to midnight.

The remaining 107 cars now trapped in the system will be flashed "on-line" prior to prerolls Monday morning when the plant starts up. We have developed this plan with HSAP and will use the PUMA tools to complete this action.

Subject: RE: B3A Investigation Status Update

Team,

I have downloaded all the data from the PUMA's and analyzed it. The conclusion is that 126 vehicles need to be checked to determine if the flash was sucessful. I will be meeting with plant personnel later today to show them the suspect list of VIN's. My position is that they put a hold on the 126 vehicles until they are checked for the right level of software. If a reflash is required, the TRW on-site representative and perhaps plant personnel can flash them.

Also, there is another issue with the data that needs to be resolved. There is a discrepancy between what VIN's are recorded in the QLS system and the VIN's stored in all the PUMA tools combined. I am comparing this data to see if perhaps the plant read a barcode into QLS without actually using the PUMA to reflash. I am working to understand and resolve the discrepancy in the data.

Please let me know if you have further questions...

Thanks.

Subject: RE: B43 / B3A - HSAP EPAS loss of assistance

Team,
I was not able to stay connected today.

On regards to the 2 M10 units that failed, I spoke to the Drivers:
June event: the driver was close to the Plant 3 Miles away (on a Straight line coasting down to take a curve) no street bumps in this section of the Road which all M10 Units take due to proximity to the Plant
July Event: The Driver was about 7 miles away from the plant accelerating going Up in a curve when he noticed the High effort (after that the cluster alarm displayed)
No bumps or special road condition is present in this section of the road.

Thanks

Eric -

These B9A's are starting to scare me. They keep popping up and we have been working on root cause for several months with lot of work but little success. Are there any other resources we have access to at TRW that can help in resolving this issue? Do you have some top technical specialist you can engage or do you have access to some university professors that can help? We need a crack investigative team working on this one.

Subject: RE: B9A Faults - Getting Out of Hand

I think its possible we may have an emerging issue. Its hard to say conclusively but it seems that we have had an uptick in B9a's especially at HSAP. We have seen 4 B9a's and 1 B92 at HSAP as a 0Km since the beginning of March.

The two recent root causes identified may be related - Encode IC failure, and Encoder Signal Open Circuit.

In terms of help I think the process we are using is working we may need more UK resources under Geoff to trouble shoot the recent rash heading to the UK.

Key Players:

Geoff Jacks
Phil Browne
Andrew Williams
Alexander Kleist
Bal Panaser (Owns all of the EPP, He is a director level I believe)

Subject: Fwd: Ford Hermosillo Daily report for 05 / 19 / 2010

Guys,

HSAP Wednesday's report. We had a new B9A failure code that showed up without losing assistance, but decided to tear down the part for evaluation. Part it's being sent back to QAO for analysis this afternoon.

>>> "Angel Salazar" <angelsaa@prodigy.net.mx> 5/20/2010 7:42 AM >>>
Good morning Glenn,

1.- Here is the information for the production of vehicles with EPAS for 05 / 19 / 2010

a).- production : 1,132 units

b).- The total quantity of vehicles built with EPAS from Job # 1 to date is : 308, 420 units (to be updated).

2.- Critical Issues :

a).- During the second shift, the VRT reported a vehicle rejected by the code checker audit. I met G. Izaguirre (VRT analyst) at the repair bay to review this case.

Vehicle rotation # 5484 /VIN : 390291

EPP # 100781177J30251 / Julian date : 132

With the Ford Diagnosis Tool I found the DTC : C200D-49 (Motor Rotation Angle Sensor_internal electronic failure)

The CANape displayed the code : B9Ah

The containment action at Benteler plant to segregate the suspect Julian date 132 is on going. By 21:00 hrs there have not been found Gears of this Julian date.

The Gear will be removed from the vehicle today and will be sent to the quarantine area. I will return it to TRW QOA as soon as the Gear gets available.

3.- Comments of the day :

a).-The firsts 10 vehicles assembled with the Gears segregated at Benteler plant (suspect Julian date 124) could not be segregated for the M10 evaluation at Ford plant . The second group of 10 vehicles will be ready for tomorrow. There are still 380 Gears to be returned to production.

b).- Visit the Incoming Quality office and the quarantine crib. No issues found over here.

c).- Antonio Rogero (PVT Engr) has postponed the evaluation of the fused inner tie rods sent by Mat Alder for this Thursday 20. The objective is to check if the pacman tool used for wheel alignment can fit on the new inner tie rods without issues.

d).- We currently have one open QR at Ford Hermosillo (J240482).

e)- We have a containment action on going at Benteler plant to segregate the suspect Julian date 132..

Thanks & Best regards. Have a nice day.
A. Salazar

Tim,

Fdo. Ulloa is asking us for a detailed explanation of the double start up B9A issue we have faced and how the new software is correcting it. In the past we had given information into the plant but you guys asked us to consult first the possibility to do this once again. Are you ok for us to send the required info. or would you prefer to send it yourself?

Thanks for your comment,

Subject: B9A warranty returns all platforms

These are all the current B9A's that we recently just got back from the field.

I have not seen any B9A returns on 2012 C346 at this time.

MAO- Explorer
UR0030- Had extensive testing at both MAO & in UK all testing leads to NTF. Next Step- teardown analysis
UR0045- ambient & hot testing in MAO lead to NTF. Next step cold testing if NTF to ship to UK for further tri-temp testing- PU/PD rig.
UR0047- At WPAC(8/3) in process to ship out tomorrow hopefully, in process to 26mile for testing Chris Woodruff will lead the testing.
UR0048- At WPAC(8/3) in process to ship out tomorrow hopefully to Marion plant for Sergio to perform testing.

QAO-CD3

FR0493- arrived in QAO(8/3) ready for leak testing, Pepe to perform testing
FR0496- arrived in QAO(8/3) ready for leak testing, Pepe to perform testing

I still need to update the U502 warranty tracker with the new returns from yesterday(UR0047,48 then I will sent out the updated tracker)

Tim,

I think Russ may know more than I do on this but we have seen contamination issues with the yaw sensor in the RCM that has caused some ABS and RCM DTCs.

Russ,

Based on your understanding of the issue, could the RCM problem cause the C1277?

Thanks,

Roberto Rossi

Subject: FW: Brake DTC's C1277 / C1278 and Key Position

Mike, We have a new car produced on Monday which has the C1277, we performed the procedure included in this email you sent yesterday and we could not replicate the DTC. I drove the car in the city until I reached 45 miles, all the time the VODU (diagnostic tool) was connected to the OBDII and we could not find anything.

What do you recommend to do next?

Thanks.

Subject: RE: Brake DTC's C1277 / C1278 and Key Position

Fernando, Pablo,

Please see the agreed directions below for investigating wiring on a vehicle with ABS code C1277/C1278. Please let us know if you find anything. Thanks for your help.

Tim Snider and I discussed with Bashar and agreed on the following procedure for reviewing one or two vehicles that exhibit a C1277/C1278 at HSAP with no loss of assist observed:

1. As discussed please inspect all the HS-CAN wiring & connectors between the PSCM and ABS for any damage, pinch points, cuts, pierced wire conditions and that all connectors are properly seated. Also inspect the PSCM & ABS ground. At this point do not disconnect connectors. Please be sure to inspect the in-line connection between the PSCM jumper and the 14290 harness (see attached picture below).

2. Then perform a **controlled light wiggle** test on all connectors and in several spots along the HS-CAN wiring circuits in between the ABS & EPAS modules while continuously checking DTCs to see if an intermittent issue exists (make sure the key is in run, but the engine does not need to be running). Another alternative would be to measure the HS-CAN circuit resistances between the appropriate EPAS CAN connector pins and the appropriate OBD2 pins while performing the wiggle test to see if the resistance ever exceeds 5 Ohm. Then repeat for the ABS module. Make sure you use the proper tools specified in workshop manual section 418-00. If the DTCs or a high resistance is ever observed then note where you were wiggling when the DTC/resistance was observed.

3. If no DTCs or high resistance are measured then please disconnect and inpect the PSCM, in-line, and ABS connector for any pushed out, loose, cooroded or spread terminals or any signs of water intrusion.

Lastly we need to identify what powertrains we have seen these DTCs on at HSAP. Thanks.

The issue with wiggle test is that it is not a scientific test. How hard are you going to wiggle? Are you going to stress the harness to damage to the point of damaging it?

Before we start looking into wiggling the harness, please look ate the following:

1. The system ground, loose, corroded, etc…
2. Water intrusion in the system at the connection for any corrosion inside the connector.

Subject: RE: Brake DTC's C1277 / C1278 and Key Position

Bashar,

Do you have any concerns with wiggle testing the PSCM and ABS wires on one vehicle, to trouble shoot if there is a wiring issue causing the C1277 / C1278 DTC's? There is a wiggle test in the shop manual for diagnosing ABS issues, but the Hermosillo Electrical PVT engineer, Pablo Lujan, is concerned the wiggle test may cause an issue, and apparently there has been direction in the past not to wiggle test.

Subject: Brake DTC's C1277 / C1278 and Key Position

Russ,

Can the brake DTC's C1277 and/or C1278 be set with the key in the "on" position, but with the engine not running? We would like Hermosillo to do wiggle testing on the CD3 wires between the PSCM and ABS module, which requires the vehicle to be on a hoist, but they are concerned there may be a safety issue if the engine is running.

Subject: BSAQ#2013260820 Steering Gear Asymmetry concern.

Stop Shipment Number: SAQ201326082
Vehicle(s) Affected: Fusion & MKZ (411 vehicles only)
Plant(s) Affected: HSAP/FRAP
Other Plants Potentially Affected: None
Part(s) Affected: Steering Gears
Supplier: ZF
Vehicles held: 411
WERS Alert Number(s): A12701171

Description:

CD391 and CD533 have been placed in a Stop Ship due to a quality concern with the steering gear. An asymmetry issue was identified at HSAP EOL; the parts with the defect are from one of the supplier production lines (Line i) from production window of June 7th thru June 15th.
The supplier has two production lines (Line I and Line J).
This stop shipment is only for those 411 vehicles, the rest of the production can be shipped.

Initial binning of the concern is Supplier Quality.

The Vehicles affected by this Stop shipment will require a steering gear replacement.

Root Cause:

TBD

ICA:

6/17: To Build with Steering Gears from Line J only.

PCA:

TBD

Hello Bill,
Please take a look at the field issue below. If you think this requires more engineering input, please follow up. Otherwise, please confirm if the published recommendation is OK.
Thanks

Javier

Tim here is your list I found a couple but in late in Jan. 2010 we went over the 50 gears allowed in a six month span and the request expired and I had to put in another request so we lost a few weeks of EPAS gears in Feb. 2010. Now I have unlimited amount so we should not have a problem with getting almost all the gears back.

Canadian gears are only when needed, very hard to get those gears back very time consuming and hard to get a response from the person shipping the gears back to the WPAC.

Eric,

Do you have information on any of the warranty replaced gears shown in the attachment not returned to TRW? I could not find the VINs on your April 7 tracker sheet. There are 12 out of 30. Also, have you heard anything on the process to receive Canadian gears? There is a pie chart on the last tab summarizing the claims.

<< File: Fusion Verbatims EPAS 4.12.2010.xls >> << File: 2010 CD3-D3 EPAS Warranty Apr_7_2010.xls >>

Rob / Mike,

Notice there is one pushed out pin for the PSCM battery connector.

Every day, the chassis PVT engineers are receiving an excel file (from Mike Morton) which contains a list of parts which can be requested from dealerships for analysis.
Attached is the list of parts for today. You will see 2 EPAS-steering gears replaced due to lost assistance.
I can do the request of those EPAS-steering geras immediately. The replaced parts will be shipped to WPAC (to your attention) or to other location that you prefer.
The request is immediately approved and will arrive at final destination in 3 or 5 days via UPS.
Please let me know if want these gears for analysis.

Thanks.

Hari,
Yes, same issue is hitting CD3. For tomorrow's quality meeting, I know CD3 is on the agenda but Tom has to reflash VP C344 vehicles at the pilot plant and I have my stick slip meeting at the same time. Would you like Laura there to give an update on C200D?

Subject: RE: CD3 warranty paynter chart

Nice …. Does this capture field and plant failures? I propose we should include plant failures but may want to distinguish some way …. Perhaps coud be #plant/# field shown in the box or literally type Plant: x
……..Whatever
Field: y

Please add our latest and new favorite with the Tyco weld issue….. Two HSAP failures

Will we have a separate chart for I Re ?

Thanks

Rob, I can re-do the chart since most of the open items have changed and sit down with you and Tim next week?

From: Mrozek, Robert (R.M.)
Sent: Thursday, September 24, 2009 3:49 PM
To: Bouse, William (Bill.); Snider, Tim (T.O.)
Cc: Mrozek, Robert (R.M.)
Subject: RE: CD3 warranty paynter chart

Notes from today:

1) Add a monitor category to take one-offs off the list
2) break down and separate the tbd's when they appear to have a common bin or failure type. For instance, if we have 3 "no comms" then separate them into a bin/group on the chart.
3) interested in a long term projection to 3MIS. Can we make some type of intelligent projection? I think hari can help us with this one…I doubt we have to invent something here.
4) bring in 0km claims somewhere

These were requests from JD. I take them as "suggestions" since we can't modify the sheet to meet everyone's needs. But, let's talk and decide how we want to incorporate these suggestions.

Subject: RE: CD3 Woodpecker Strategy

Not sure if you sent me this email before or after I sent you the presentation. Did you check out the presentation? Simon can explain more, but it's a more effective way to run the woodpecker to break through ice and contamination. Running at a higher current in the part of the flow chart that was a lower current is more effective. Instead of removing the lower current portion and replacing it with higher current, they split the total time up into two portions. First the lower current, then the higher current.
