*** Web - Advice created on 05/23/2017 05:42:23 and created by Steven Okimura ***
1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

· Replace the engine with a long block, if available; otherwise, please order a short block assembly

· If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is

required

· If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

· Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

· If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

· Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

c/s vehicle running hot and loosing coolant
*** 05/31/2017 06:06:05 ***
Web - Diagnostics created on 05/31/2017 06:03:57 and created by Derrick Jernigan
good morning i have gotten this vehicle after a few techs not trained looking at the vehicle and added coolant.this vehicle does bubble alot while sitting for like a hour or so running.if i rev the engine can see the level rise threw coolant hopper and will bubble again for a bit,also if i shut off the vehicle and start it back up will shoot coolant out of the hopper.there are no leaks visable anywhere on this vehicle going onto the ground but does loose the coolant rapidly within like a week or so.(like its just burning the coolant out somewhere like a head gasket or whatever is possible).just informing you dont see this being a common concern.

1: Have you performed a "block check" to see if there is combustion gas in the cooling system? Have you performed a

cylinder leak down test to see if there is a head gasket leak?

*** 06/05/2017 05:08:37 ***
Web - Note created on 06/05/2017 05:08:37 and created by Derrick Jernigan
good morning,sorry i havent gotten back to you sooner...i have looked up these sevices on kgis and we have no special tools for this to be able do a proper check.i even seen if we could something after market but cannot.thanks

*** Web - Advice created on 06/05/2017 05:22:41 and created by David Brisky ***
1: There is a tool called "block checker" that should be available from your tool distributer or local parts house.

*** 06/05/2017 09:17:32 ***
Web - Note created on 06/05/2017 09:17:32 and created by Derrick Jernigan
found this tool that our parts department didnt know we had sorry about that

*** Web - Advice created on 06/05/2017 09:25:56 and created by David Brisky ***
1: Thanks for the update

*** 06/05/2017 10:53:05 ***
Web - Note created on 06/05/2017 10:53:04 and created by Derrick Jernigan
okay i have done the test.got the tool drained coolant level some and had the engine at idle,poured blue fluid to the yellow line and followed instructions for test,put on the neck for a good seal and sqeezed ball for approx one minute to draw in the gases.i went from blue to like a green witch did not stay blue.didnt draw any coolant in during test performed twice to make sure.

*** Web - Advice created on 06/05/2017 12:16:16 and created by David Brisky ***
1: Perform a cylinder leak down test to see which pressurized cylinder produces bubbles in the cooling system.

*** 06/06/2017 12:00:56 ***
Web - Note created on 06/06/2017 12:00:56 and created by Derrick Jernigan
good afternoon i have got bubbles in cyl #1 and #3 can hear it threw the radiator cap all other cylinders where good.the two pro blems cylinders were around 15% leakage at set 0 to 100psi .

*** Web - Advice created on 06/06/2017 12:33:45 and created by David Brisky ***
1: Get DPSM approval to remove the cylinder head to measure the head block surface flatness with a precision straight edge as outlined in the shop manual.

*** 06/08/2017 05:13:02 ***
Web - Note created on 06/08/2017 05:13:02 and created by Derrick Jernigan
okay i have gotten the head off last night.took a percision straight edge to measure the block and was under .05 mm across the block witch is max.i also checked the head itself and was under 0.05mm. but just to inform you i found that when breaking loose the head bolts i found the outsides to be tight.the one closest to front on the left side was super tight to break bellow that was barely any effort to break one hand,right of that one loose as well one hand to break,above that same,to right of that guy same bellow him was tight and others at trans side were tight.looked like gasket busted in the middle between those cylinders witch be the cause of the not so tight head bolts.just updating the case. so like 3 of 8 were tight only.

*** Web - Advice created on 06/08/2017 05:30:26 and created by David Brisky ***
1: Be sure to check the surfaces multiple ways as outlined. You may want to try torqueing the bolts back down to spec prior to ordering parts to make sure the threads don't pull out of the block.

*** 06/08/2017 06:43:20 ***
Web - Note created on 06/08/2017 06:43:20 and created by Derrick Jernigan
so you would like me to put old gasket and the head back on to retighten to spec in the order given to check? and yes i did do it multiple ways not just straight across.

*** Web - Advice created on 06/08/2017 06:47:06 and created by David Brisky ***
1: Since the head and block are within specification then install a new gasket and check.

*** 06/14/2017 08:01:55 ***
Web - Note created on 06/14/2017 08:01:55 and created by Derrick Jernigan
the new gasket should be in tomorrow or later today then will update when put back together.

*** Web - Advice created on 06/14/2017 08:04:08 and created by David Brisky ***
1: Thanks for the update

*** 06/15/2017 08:21:34 ***
Web - Note created on 06/15/2017 08:21:34 and created by Derrick Jernigan
okay i have had the threads pull out of the engine in the sequence of tightening 1 pulled,2 good,3 pulled ,,4 pulled, also 5 and 6, 7 and 8 were good.on the 120 degree is when they started to pull along maybe on my 70 degree got loose.
i wanted to save myself a little work so was 50% chance to pass or not.so this will need either a short or long block i guess what i can get available just updating.

*** Web - Advice created on 06/15/2017 08:24:43 and created by David Brisky ***
1: If the cylinder head is OK then just replace the short block

*** 07/12/2017 10:43:57 ***
Web - Note created on 07/12/2017 10:43:57 and created by Derrick Jernigan
okay i have no availabilty on short block and the total with parts is around 4271.99

i have a long block we can get available with right gaskets to assemble is around 4986.18 so was just wondering if we can just get a long block to repair this vehicle asap thanks

*** Web - Advice created on 07/12/2017 11:54:22 and created by David Brisky ***
1: What is the difference in price?

*** 07/12/2017 12:40:10 ***
Web - Note created on 07/12/2017 12:40:10 and created by Derrick Jernigan
about $715.16 i had the two prices listed for both

*** Web - Advice created on 07/12/2017 13:24:30 and created by David Brisky ***
1: Yes replace the long block

*** 07/20/2017 12:05:07 ***
Web - Note created on 07/20/2017 12:05:07 and created by Derrick Jernigan
i have replaced the long block and tested drives and rides as designed.

ATTEMPTED TO RETORQUE HEAD BOLTS ON BOTH BANKS, ALL BOLTS ARE STRIPPING OUT.

*** Web - Advice created on 06/06/2017 13:26:01 and created by Frank Lusic ***
1: Based on the information that you have provided the engine will need to be replaced.
Please check to see if this engine has not sustained any external impact damage
If the warranty is still valid, please open a PWA case
You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form dated 11/1/16 to the case with both the service manager and technician signatures on it. Thanks
,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments.

2: If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.
Please close this case and open a PWA case and complete the survey

customer complaint of oil leak

*** 06/14/2017 07:13:42 ***
Web - Diagnostics created on 06/14/2017 07:13:42 and created by Justin Rowe
did prior repair of oil pressure switch. customer returned stating oil still leaking. diagnosis as oil filter housing. replaced oil filter housing and rechecked. oil leak still present. rechecked. it appears that the oil leak is coming from the right side head gasket (intake side) and dripping over the oil filter housing. it is very hard to diagnosis this concern, as that many components are in the way. and when removed can not run engine

1: Since you cannot see the source of the leak easily please add some leak detection dye to the oil and run the vehicle. Then when the intake is removed use a UV light to follow the trail to the source.
2: You can connect the evap smoke machine to the oil dipstick tube and lightly pressurize the crankcase with smoke and air.

Do not use high pressure or you can damage engine seals but if you find smoke escaping it can help you pin point the source of the leak. Depending on the component and the location this may or may not work. If you can see the source of the leak, please take pictures showing where it is leaking from and attach them to the case. Thanks.

1: Good job finding the source of the leak and thanks for the picture. Please contact your DPSM for authorization to remove the head and to replace the head gasket and to check for damage to the block deck and head. While removing it check the head bolts in the area of the leak and note if any are loose indicating there may be damage to the threads in the block. If they are loose, stop and note it in the case. Let me know what you find. Thanks.

1: Thanks for clarifying. Based on the information you provided, my recommendation is to replace the engine following normal service procedures. Please note:
Replace the engine with a long block, if available; otherwise, please order a short block assembly
- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.
- Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

2: You are at a self-authorizing dealer so no PWA case is required; just verify the warranty is valid. Thanks.

1: Hello Cody
Based on this information the cylinder head or heads will need to be removed for inspection (on the bank that is leaking), But there is one thing that I would like you to check when you are disassembling the motor, There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser then the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** 07/31/2017 07:39:56 ***
Web - Note created on 07/31/2017 07:39:56 and created by CODY TINNELL
okay.
I started to remove bank 2 cylinder head. I attempted to check the torque of the cylinder head bolts. found 3 cylinder head bolts loose and will not tighten up properly.

*** Web - Advice created on 07/31/2017 08:00:27 and created by Frank Lusic ***
1: Thank you for that information
Based on the information that you have provided the engine will need to be replaced.
If the warranty is still valid, please open a PWA case
You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form dated 11/1/16 to the case with both the service manager and technician signatures on it. Thanks
,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments.

2: If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.
Please close this case and open a PWA case and complete the survey

*** Web - Advice created on 07/31/2017 08:29:30 and created by Brian Lall ***
1: Based on the information you provided, my recommendation is to replace the engine after getting authorization. Make sure to check the complete cooling system including the fans after the repair or the new engine can become damaged.
2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N.
Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head if needed. When replacing the short block, you must

inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one.
3: If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

this is a pwa tech case. I already added a pwa form.

*** Phone - Advice created on 07/31/2017 09:35:52 and created by Brian Lall ***
1: Cody called and let me know this was a PWA case. I apologized for my mistake. I reviewed the PWA form and advised I am going to process the case.
2: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:
Replace the engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.
- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.
- Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.
- If this is a turbocharged engine make sure to replace the turbo.

*** Web - Advice created on 08/01/2017 09:06:41 and created by Jerry Gossling ***
1: Note,
Warm up the engine to operating temperature. Next perform a cylinder leak down test per technician basics TB009 and while performing this test have the radiator cap removed so you can see if any coolant pushes back out of the radiator filler neck during the test.
List the results of the test and if any coolant pushed out of the radiator fill neck during the test.

*** 08/01/2017 13:41:12 ***
Web - Note created on 08/01/2017 13:41:12 and created by Luster Thompson
performed leak down test found leak on cylinder 3 at 25% leaking into coolant causing coolant to bubble up all the over cylinder reading were perfect

*** Web - Advice created on 08/01/2017 14:27:58 and created by Jerry Gossling ***

1: Based off of your information the engine has a blown head gasket.
Note, see if one of the head gaskets is leaking externally.

*** 08/01/2017 17:09:07 ***

*** Web - Advice created on 08/14/2017 11:01:07 and created by Greg Phillips ***
1: Corrected RO number.

Your completed and signed WRTY143 core data form has been reviewed. Based on the information you have provided, you are authorized to replace the engine. Note:

- Replace engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, inspect thoroughly to determine if head replacement is required

- If a cylinder head is required, re-use any parts that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason on your hard copy and replace the component.

- If equipped with a turbo, be sure to check the turbo and oil feed line as well. Replace the turbo, oil feed line and banjo bolt if build up, metal debris or excessive wear to the turbo are found.

- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the manifold with a NEW one.

Make sure the ladder frame bolts are installed in the replacement eng

1: Thanks for the videos. Did you find any source that could cause overheating other than the leak such as a sticking thermostat or the cooling fan not working?
2: Please get authorization from your DPSM to remove the intake, bank 1 valve cover, and cams then check the head bolts around the area where the leak is and note if any of them are loose or stripped. Let me know what you find. Thanks.

*** 08/21/2017 15:16:27 ***
Web - Note created on 08/21/2017 15:16:26 and created by CODY TINNELL
I could not find any other source of over heating, I added coolant and the vehicle did not overheat. fans and t stat are working. only overheats when low on coolant.

I removed the rear valve cover and attempted to tighten the head bolts, they will not torque down properly, just keep turning inside block.

*** Web - Advice created on 08/22/2017 06:01:38 and created by Brian Lall ***
1: Thanks for checking. Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.
2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head if needed. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one.
3: If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

*** Web - Advice created on 08/22/2017 09:42:04 and created by Steven Okimura ***
1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

· Replace the engine with a long block, if available; otherwise, please order a short block assembly

· If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

· If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

· Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

· If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

· Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

Leaking coolant

*** 08/30/2017 09:26:32 ***
Web - Diagnostics created on 08/30/2017 09:26:32 and created by Michael Orser
Pressure tested system found the coolant manifold leaking that goes on the back of each head .repaired that leak to find another leak between the bank 2 head and block.removed the bank 2 head to inspect and none of the head bolts were tight.i literally took them out with my fingers.the advisor spoke with the customer and they said they drove it until it lost power ,let it cool and drove it again over and over until finally towing it to home.then drove the car to us the next day.anyway the head and the block at least the left side is straight amazingly enough but my concern is what the motor went through I'm not sure how to address this what are your thoughts thanks Mike

Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 08/30/2017 09:43:28 and created by Brian Lall ***
1: Michael, since all the head bolts were loose, I think it is very likely the threads in the block were damaged. Please inspect all the threads and head bolts for signs of damage and note if the head bolts will tighten at all or if they just continue to turn without ever getting tight. Let me know what you find. Thanks.

*** 08/30/2017 10:04:23 ***
Web - Note created on 08/30/2017 10:04:23 and created by Michael Orser
All of them tightened the 30.4 lb.ft.but 3 of the 8 just spun while trying to stretch the 118-122°.

*** Web - Advice created on 08/30/2017 10:59:19 and created by Brian Lall ***
1: Thanks for checking. Based on the information you provided, my recommendation is to replace the engine following normal

service procedures. Please note:
Replace the engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.
- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.
- Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

2: You are at a self-authorizing dealer so no PWA case is required; just verify the warranty is valid. Thanks.

*** Web - Advice created on 09/05/2017 08:09:18 and created by Brian Lall ***
1: It is NOT recommended to repair the threads in the block. Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.
2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head if needed. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace

the intake manifold with a NEW one.
3: If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

*** 09/07/2017 10:03:53 ***
Web - Problem Description created on 09/07/2017 10:03:53 and created by Patrick Faulkner
C/S temperature gauge rose to h and then engine light came on. turned off vehicle and towed in
p0306-cylinder 6 misfire

*** 09/07/2017 10:03:53 ***
Web - Diagnostics created on 09/07/2017 10:03:53 and created by Patrick Faulkner
found the coolant manifold to be leaking and replaced under extended warranty. also noticed when on test drive there is a chattering from under hood and the temp gauge was rising to hot and when pulled vehicle back in the over flow was bubbling.

*** 09/07/2017 10:04:38 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin Default

*** Web - Advice created on 09/07/2017 10:09:09 and created by Eric Patterson ***
1: Looks like we should perform a block check and see if there are any exhaust gases in the cooling system. Please let me know what you find...

*** 09/07/2017 10:31:00 ***
Web - Note created on 09/07/2017 10:31:00 and created by Patrick Faulkner
have not done a block check, but removed the spark plugs on cylinder 2-6 and cylinder 6 spark plug looks a little washed and took boroscope and looked down all three cylinders and cylinder 6 is completely clean and cylinders 2 and 4 have deposits(carbon build) them. forgot to tell you that when pulled vehicle back into shop the coolant over flow bottle was full and bubbling

*** Web - Advice created on 09/07/2017 10:42:03 and created by Eric Patterson ***
1: Perform a compression test on the front bank and see what your readings are.
Report the readings...Thanks.

2: If the block is warped then it will need a new engine...
3: Is this vehicle under power train warranty or does it have extended warranty?
Check warranty coverage and let me know.

*** 09/08/2017 11:59:07 ***
Web - Note created on 09/08/2017 11:59:07 and created by Patrick Faulkner
performed a coolant pressure test, its a easier test. after letting sit for 30-40 min pulled spark plug and put borescope and took picture of coolant in cylinder.
also when pulled vehicle into shop after letting sit over night there was a hard misfire

1: Based on the information provided the engine should be replaced. You are required to open a separate TL PWA Case to gain authorization for engine replacement approval PRIOR to replacement, attach the revised Engine core data sheet to the case (form WRTY143) dated 11-1-2016 and reference this techline case number in your notes. Information for this process can be found in Warranty Bulletin 2016-22.

*** 09/14/2017 14:46:45 ***
Web - Note created on 09/14/2017 14:46:45 and created by Ruben Gonzalez
you stated that the engine should be replaced. I looked up the parts availability on the long block and it says that kia discontinued the long block. seeing how this engine was severely over heated should I replace the heads and bottom end or check the heads first to see if they're able to be saved?

*** Service Alert Escalated to CA as: 12482685 on 09/15/2017 01:04:42 (PST)
*** Web - Advice created on 09/15/2017 05:49:54 and created by Steven Okimura ***
1: I would recommend replacing the cylinder heads since it was overheated.

1: Thanks for the pictures and for letting me know what you found. Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.
2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head if needed. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one.
3: If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

*** Web - Advice created on 09/22/2017 09:33:57 and created by Brian Lall ***
1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- ☐Replace the engine with a long block, if available; otherwise, please order a short block assembly

- ☐If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

- ☐If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- ☐Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

- ☐If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

- ☐Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

3rd time back with oil in coolant and visa versa..refer to previous case.

found a 4% leak on cyl 3. removed engine and tore down to find cause. found 2 head bolts were some what loose. also the block around cyl 3 and a couple other spots are warped. the head is ok though, no warps. found oil through out cooling system as well as coolant in the oil pan and engine.

*** Web - Advice created on 12/01/2017 06:04:39 and created by Tony Thomas ***
1: Matthew. Please use the web portal to reopen previous cases instead of opening a new duplicate case.
If proper maintenance and warranty are validated, attach a copy of the completed and signed core data form to the case. The form must be filled out (all available sections) and signed and dated by the service manager and technician. If neglect is evident, a photo of the full complete valve train is required.

1: This is a repair assistance case. If proper maintenance and warranty are validated, you are required to open a PWA case for warranty approval. Please go to the web portal for new cases, select "new case" and then select "Prior Warranty Authorization". Select the proper component (ENGINE) and complete the required information. Be sure the title is not branded (salvaged) and select “Yes” for warranty validation. Reference this case number in your case notes. Prior to case creation, attach a copy of the completed core data form.

*** Web - Advice created on 10/19/2017 09:12:39 and created by Jerry Gossling ***
1: Carl,
Based off of this information the head bolts are stripped out so the engine will need to be replaced.

Based off of your information you will need to open a pwa case for warranty authorization for approval to replace the engine. Follow the listed information.

2: Open a required PWA for approval to replace the engine and update and close this case and perform the Technician survey. Please review the warranty bulletin 2015-09 (sent to your dealer) and attach the completed and signed WRTY143 Core Data Form to the PWA case or the warranty process will be delayed.
Thank you.

customer states while driving vehicle from st.louis to springfield mo the temperature gauge began to fluctuate then the vehicle overheated. The customer pulled over let vehicle cool off added a gallon of antifreeze. stated over flow was steaming.

*** 10/23/2017 12:42:04 ***
Web - Diagnostics created on 10/23/2017 12:42:04 and created by Daniel Hull
First verified oil in coolant reservoir. Checked for external coolant leaks non found. Checked radiator fan operating okay. Believe engine block is cracked allowing oil to enter coolant passage way. Can attach pic of reservoir. Can i proceed with ordering long block assembly with photo of reservoir?

*** 10/23/2017 12:52:34 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 10/23/2017 12:53:40 and created by Brian Lall ***
1: Please fill the radiator with water and pressurize the cooling system. Remove the spark plugs and inspect all the cylinders with a bore scope and note if there is coolant going into the cylinders.

*** 10/25/2017 05:20:03 ***
Web - Note created on 10/25/2017 05:20:02 and created by Daniel Hull
i removed all plugs and inspected No coolant in cylinders. Will proceed with engine removal for further inspect for crack in block.

*** Web - Advice created on 10/25/2017 08:03:26 and created by Brian Lall ***
1: Before removing the engine, perform a cylinder leak down test on all cylinders and note the percentage of leak down and note where the air is escaping from during the test (radiator, intake, exhaust, another cylinder, or crankcase) and inspect the spark plugs.

*** 10/25/2017 08:47:17 ***
Web - Note created on 10/25/2017 08:47:17 and created by Daniel Hull
No evidence on plugs. Applied shop air to cylinder only found cylinder on right hand corner of rear cylinder head to have 20% cylinder leakage. Noise mainly heard from crank case during test. Had to remove camshafts due to borscope mirror falling into cylinder during inspection no longer able to make full revolution. Lots of oil behind water pump and in heater pipes.

*** 10/25/2017 09:39:35 ***
Web - Note created on 10/25/2017 09:39:34 and created by Daniel Hull
Removed cylinder head bolts, bolts were loose. Block is damaged in rf upper head bolt hole threads are broken. Cylinder heads are warped from engine over heating. Will be ordering long block assembly if available.

*** Web - Advice created on 10/25/2017 09:45:34 and created by Brian Lall ***
1: Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.
2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head if needed. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one.
3: If you replace any new parts on the cylinder heads, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

1: Jim,
Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. (this is a separate operation in the warranty claim). If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.
- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

- Make sure all of the ladder frame bolts are installed in the replacement short engine.

Dealer: MD006 Hagerstown Kia

Phone: 3017397283 **FAX:** 3017336720

Contact: MIKE CASE **Contact Title:** Exclusive Kia Technician **Service District:** SO10

Case Details:

Case Title: MIL - PCM # - P0302

Symptom: Misfire **DTC:**

System: Engine Mechanical

Component: Cylinder Block

Resolution: replaced injectors./replaced

Case History

*** 10/30/2017 09:25:03 ***
Contact = MIKE CASE, Priority = Standard, Sub Status = Dispatched

*** 10/30/2017 09:25:04 ***
Web - Problem Description created on 10/30/2017 09:25:03 and created by MIKE CASE
Customer states engine is running rough . I have confirmed engine has a misfire on cylinder 2.

*** 10/30/2017 09:25:04 ***
Web - Diagnostics created on 10/30/2017 09:25:04 and created by MIKE CASE
Vehicle is misfiring on cylinder 2 only under load and will set code for that cylinder and it clears itself. I have moved coil and spark plug . Misfire stays in 2 . I have short term and long term reading that suggest no leaks in intake system or dripping injector. injector times are the same on all injectors nothing unusually.

*** 10/30/2017 09:36:23 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin Default

*** Web - Advice created on 10/30/2017 09:39:47 and created by Eric Patterson ***
2: Please monitor the injector wave graphs and see if this is your issue. TSB FUE 035. I have seen these injectors resolve several miss fire issues. Please perform a compression check on the front 3 cylinders and make sure compression is the same in all 3. Then pr
3: There is a TSB related to this problem. However the production cut off does not fall into the production range for this VIN. Please replace the 6 injectors with the parts listed below. Please do not use the labor op in the TSB FOR THE REPAIR. PLEASE USE REGULAR WARRANTY LABOR OPS FOR THE REPLACEMENT OF THE INJECTORS
Fuel Injector Assembly's 35310 3C560 X6 injectors.

Let me know what you've found after diagnosis.

*** 11/07/2017 12:23:37 ***
Web - Note created on 11/07/2017 12:23:37 and created by MIKE CASE

All front compression readings are cylinder 2 151 cylinder 4 is 150cylinder 6 150

*** 11/07/2017 13:00:51 ***
Web - Note created on 11/07/2017 13:00:51 and created by MIKE CASE
replaced all six injectors vehicle still misfired for a least 10 min . Its running ok now. will need to drive it again to make sure

*** Web - Advice created on 11/07/2017 13:09:09 and created by Eric Patterson ***
1: Please let the vehicle cool down completely and have the KDS hooked up and monitor the misfire counters upon startup.

*** 11/08/2017 04:56:30 ***
Web - Note created on 11/08/2017 04:56:30 and created by MIKE CASE
I have driven it 50 miles no misfire occurred . Then this morning vehicle misfiring on cylinder two . Once engine get warms up it stopped .

*** Web - Advice created on 11/08/2017 07:37:29 and created by Eric Patterson ***
1: Thank you for the information. Please check the connections at the injector driver box. E70 for loose connector or pin tension for cylinder #2 pins 19,34

Please check connectors CC22-B and EC11. Check the connections well and apply stabilant 22 and check pin tension.
2: we may need to possibly swap the injector driver box with a known good unit.
3: Please also check the connection at the PCM.

*** 11/14/2017 06:11:41 ***
Web - Note created on 11/14/2017 06:11:41 and created by MIKE CASE
I have checked injector drive connection 19 34 cant see any problem added stab 22 . I have installed swap module vehicle hasn't misfired on test drive so far I will drive vehicle a couple more times and report back

*** Web - Advice created on 11/14/2017 08:04:03 and created by Eric Patterson ***
1: Thank you, we will see if It was just a connection issue or if the PCM has problems. Thank you for road testing.

*** 11/15/2017 03:44:07 ***
Web - Note created on 11/15/2017 03:44:06 and created by MIKE CASE
Ok after checking connection and replacement of the I D B . after driving 20 miles car missing firing on cylinder to again. then on the way back vehicle stopped misfiring . light still on but it's not misfiring at this moment

*** Web - Advice created on 11/15/2017 07:22:54 and created by Eric Patterson ***
1: Ok please re road test and see if the problem comes back. If the misfire comes back please try a known good PCM if the problem comes back.

*** 11/15/2017 07:26:41 ***
Web - Note created on 11/15/2017 07:26:41 and created by MIKE CASE
Ok will do

*** Web - Advice created on 11/15/2017 07:31:09 and created by Eric Patterson ***
1: This vehicle actually does fall within the TSB, please when completing the repair order use the labor op for the injector replacement in the TSB. Let me know if it starts up again, thanks

*** Service Alert Escalated to CA as: 12548650 on 11/16/2017 01:06:02 (PST)

*** 11/16/2017 05:05:55 ***
Web - Note created on 11/16/2017 05:05:55 and created by MIKE CASE
I just letting you no our sorento is still has a misfire on cylinder 2 and I dont have pcm to try . Any thing else I could try

*** Web - Advice created on 11/16/2017 07:58:28 and created by Eric Patterson ***
1: Is there spark from the #2coil?
Is this misfire there all the time?

*** 11/16/2017 10:46:37 ***
Web - Note created on 11/16/2017 10:46:37 and created by MIKE CASE
misfiring occurs intermediately at time could last up to 10 miles then stops then it will start again . seems to happen more when engine is cold

*** Web - Advice created on 11/16/2017 10:47:58 and created by Eric Patterson ***
1: Is there spark from the #2 coil when the misfire is present?

*** 11/17/2017 12:10:19 ***
Web - Note created on 11/17/2017 12:10:19 and created by MIKE CASE
Vehicle has not misfired today .Have monitored with kds on 20 minute test drive no misfire.

*** 11/20/2017 06:13:26 ***
Web - Note created on 11/20/2017 06:13:26 and created by MIKE CASE
Cold start up this morning . Sorento engine felt like it was misfiring but was not counting or setting code for misfire. KDS pulled no codes . Will let customer have vehicle if it doesnt code .

*** 11/20/2017 06:13:42 ***
Case Closed with Resolution Code: Faulty Component
Resolution Summary: replaced injectors.

*** 11/22/2017 05:00:00 ***
Case Number: XXXXXXXX Reopen Requested by MIKE CASE.
Reason: [I have driven vehicle the last 2 morning it does not set dtc but it has poor performance and ive seen cylinder 2 misfire counters .]

*** 11/22/2017 08:45:20 ***
Reopened with Sub Status of Working

*** Web - Advice created on 11/22/2017 08:45:55 and created by Eric Patterson ***
1: There are no DTC's that come up? The poor performance what exactly do you mean?

*** 11/22/2017 10:55:04 ***
Web - Note created on 11/22/2017 10:55:04 and created by MIKE CASE
just drove it after letting it sit outside all night . It has recoded for p0302 flashing engine light . I like to do compression test after it cools down we might have exhaust valve sticking

*** Web - Advice created on 11/22/2017 10:57:34 and created by Eric Patterson ***
1: Thank you please perform the compression test.

I know we did the test before but was it warm or cold before?

*** 11/22/2017 11:10:34 ***
Web - Note created on 11/22/2017 11:10:34 and created by MIKE CASE
normal temp cold weather really bring misfire in this one

*** Web - Advice created on 11/22/2017 11:16:35 and created by Eric Patterson ***
1: Thanks for the info.

*** 11/27/2017 07:27:51 ***
Web - Note created on 11/27/2017 07:27:51 and created by MIKE CASE
Completed compression check all cylinders 1 3 5 are 149 to 150 psi 2 4 6 are 150 psi. I agree It would be nice to have pcm to try . Vehicle has turned off coil control side when it sets misfire code p0302 but when I clear I have a good control signal. I have checked pin fit at coil 2 and injector harness. I have performed resistance check for injector harness to engine room fuse block less than one ohm on wire

*** Web - Advice created on 11/27/2017 07:40:01 and created by Eric Patterson ***
1: Are the misfire counters "catalyst damaging" misfires?

*** 11/27/2017 08:11:45 ***
Web - Note created on 11/27/2017 08:11:44 and created by MIKE CASE
Yes, catalyst damaging, emission related and misfire are all same count when miss firing they go to 100 and start back over.

*** Web - Advice created on 11/27/2017 08:24:20 and created by Eric Patterson ***
1: Have you swapped the coil to the front as well last time you had the intake off?
2: Have you performed the adaptive relearn of the injectors per the TSB? Please try the relearn procedure again.

*** 11/27/2017 08:38:52 ***
Web - Note created on 11/27/2017 08:38:52 and created by MIKE CASE
I have swapped coil and plug

*** 11/27/2017 08:50:58 ***
Web - Note created on 11/27/2017 08:50:58 and created by MIKE CASE
relearn of the injectors per tsb fue 035. Eric I have searched tsb and web site I did not find anything injector relearn . I have performed hard reset . But if you could send me procedure on the injector relearn

*** Web - Advice created on 11/27/2017 09:43:41 and created by Eric Patterson ***
1: Basically the PCM adaptive value reset. This will reset all adaptive values.
2: Our next step would be to try a known good PCM. The vehicle has been there for 30 days now and there hasn't been a PCM to try?

*** Web - Advice created on 11/27/2017 09:47:06 and created by Eric Patterson ***
1: I have escalated the case for review with the FTS to come out to look at the vehicle, please try to find a PCM it will take a week or 2 possibly to get someone there. Please provide the following information for the FTS:
Actual Technicians name working on the vehicle:
Technicians cell phone number:
Is the vehicle at the dealership? Y/N

*** 11/27/2017 12:44:19 ***
Case Closed with Resolution Code: Faulty Component
Resolution Summary: replaced injectors.

*** 11/27/2017 14:56:45 ***
Reopened with Sub Status of Working

*** Web - Advice created on 11/27/2017 14:56:53 and created by Eric Patterson ***
1: Did the adaptive value reset repair the problem?
The engineers are asking me at this point?

*** 11/28/2017 05:19:28 ***
Web - Note created on 11/28/2017 05:19:28 and created by MIKE CASE
I having hard time finding adaptive value reset procedures for this vehicle it has no option in menus for a reset . I have performed hard reset by connecting positive lead and negative leads together but that did not change misfire.

*** Web - Advice created on 11/28/2017 07:08:11 and created by Eric Patterson ***
1: Do you still need the FTS to come to the dealer?

*** 11/28/2017 08:22:19 ***
Web - Note created on 11/28/2017 08:22:19 and created by MIKE CASE
I f I could a ecm I would try it before sending ftr . Then If ecm did not correct problem . It would have to be in harness

*** Web - Advice created on 11/28/2017 08:30:19 and created by Eric Patterson ***
1: I think we will continue with the FTS to come out and look at the vehicle, If your saying there is a misfire, then they should be able to help resolve the issue.
2: Please provide the following information for the FTS:

Actual Technicians name working on the vehicle:
Technicians cell phone number:

Is the vehicle at the dealership? Y/N

*** 11/28/2017 11:13:53 ***

*** Web - Note created on 11/30/2017 08:24:04 and created by Russell Guss ***
FTS (Jim S.) is working with the tech over the phone. A visit date will communicated based on the results of the FTSs suggestions.

*** Web - Advice created on 11/30/2017 08:28:51 and created by Eric Patterson ***
1: Understood

*** 12/04/2017 08:19:55 ***
Web - Note created on 12/04/2017 08:19:55 and created by MIKE CASE
FTR want to pull head. Want valves checked and cylinder wall inspected

*** Web - Advice created on 12/04/2017 08:21:36 and created by Eric Patterson ***
2: Ok please perform the advise from the FTR and check the threads when removing the rear cylinder head for loose threads on the head bolts. If you can perform a block check when cold before disassembly please do as the vehicle warms up it may be seeping coolant into the cylinder.

*** Phone - Advice created on 12/05/2017 09:13:25 and created by Eric Patterson ***
1: Pull the head off, check the springs on the front cylinder head.
Performed down test on #2 cylinder. 5% leakage.
Advised before pulling the head bolts out, please re torque the heads bolts and see if they will tighten before removal of the cylinder head to check the thread strength on the block for the head bolts. I have seen a few failures of the block threads for the head bolts.
Tech has noticed condensation in the cylinder with a bore scope.

Tech will continue with the head removal and gasket inspection. Please strait edge the block and head after removal, thnaks

*** 12/05/2017 11:22:18 ***
Web - Note created on 12/05/2017 11:22:18 and created by MIKE CASE
good call eric I found one head bolt that would not re torque to spec.

*** Web - Advice created on 12/05/2017 11:26:47 and created by Eric Patterson ***
1: Awesome to hear please let the FTS know. Was it near the #2 cylinder by any chance?

*** 12/05/2017 11:40:21 ***
Web - Note created on 12/05/2017 11:40:21 and created by MIKE CASE
yeah intake side second one

*** Web - Advice created on 12/05/2017 11:42:53 and created by Eric Patterson ***
1: I have a feeling the moisture you saw was the problem, then when warmed up the surface of the cylinder head and the block swell together and seal temporarily.
2: Thanks for all the hard work from yourself the FTS and me I think we have this one in the bag.
3: See if the FTS wants to just continue with the engine replacement.

*** Web - Advice created on 12/19/2017 14:18:03 and created by Eric Patterson ***

1: How is the repair going? Are we replacing the engine?

*** 12/21/2017 08:54:10 ***
Web - Note created on 12/21/2017 08:54:10 and created by MIKE CASE
we are in process of rebuilding short block

*** Web - Advice created on 12/21/2017 09:01:35 and created by Eric Patterson ***
1: Sounds good, thanks for the update...

*** 01/03/2018 07:26:34 ***
Web - Note created on 01/03/2018 07:26:34 and created by MIKE CASE
I have started new rebuild engine . Engine is still misfiring on cylinder 2

*** Web - Advice created on 01/03/2018 08:18:39 and created by Eric Patterson ***
1: Have you reset the adaptive values?
2: Please see if by disconnecting the coil the misfire gets worse.

*** 01/03/2018 12:12:17 ***
Web - Note created on 01/03/2018 12:12:17 and created by MIKE CASE
reset adaptive by taking positive and negative cables sticking them together . Kds doesnt have option to reset adaptive. I misfire does not change when coil is removed

*** Web - Advice created on 01/03/2018 13:17:25 and created by Eric Patterson ***
1: Is there spark try pulling the coil up slightly while the engine is running and see if you can hear the spark arching

*** 01/05/2018 07:24:38 ***
Web - Note created on 01/05/2018 07:24:38 and created by MIKE CASE
Their is a slight pulse from raising coil off plug

*** Web - Advice created on 01/05/2018 07:47:28 and created by Eric Patterson ***
1: do you have a spark tester? Please compare to the cylinder next to it.

*** 01/08/2018 07:22:50 ***
Case Closed with Resolution Code: Faulty Component
Resolution Summary: replaced injectors./replaced short block, threads stripped in block for head bolts at #2 cylinder.

*** 01/09/2018 09:28:48 ***
Case Number: XXXXXXXX Reopen Requested by MIKE CASE.
Reason: [Car returned today with a history code p0302 . Customer complaining of engine light flashing with vibration]

*** 01/10/2018 06:02:36 ***
Reopen Denied by Tony Thomas
Reason: Please open a new case for the REMAN engine concern.

*** 01/10/2018 10:52:54 ***
Reopened with Sub Status of Working

*** Web - Advice created on 01/10/2018 10:55:14 and created by Brian Lall ***
1: In a duplicate case the tech stated: Customer is complaining of engine light flashing and vibration .

Web - Diagnostics created by MIKE CASE

I have confirmed engine has p0302 in history . Engine is running fine today . This vehicle has repeated p0302 codes and has had extensive repairs and diag performed from ftr and my self

2: I initially did not realize the short block was replaced until reading through everything done on this vehicle previously. Since the concern is the same I am going to continue on this case. Have you duplicated the concern on this visit?
3: An FTS is being requested due to previous FTS intervention and the multiple visits and repairs for this concern including engine replacement, continue with diagnosis until further notice. Please provide the following information:
Name of technicians working on the vehicle:

Technicians phone number:
Is the vehicle at the dealership?

*** Web - Note created on 01/11/2018 15:25:34 and created by Luis Hernandez ***
FTS will visit this case on 1/25/2018. Please continue with diagnosis.

*** 01/12/2018 06:12:30 ***
Web - Note created on 01/12/2018 06:12:30 and created by MIKE CASE
I have ordered engine main harness . Jim ask it be replaced should i continue or wait .

*** Web - Advice created on 01/12/2018 07:50:05 and created by Jerry Gossling ***
1: Note,
The FTS requested to replace the main wire harness?
If this is correct follow his recommendation.
Thanks

*** Web - Advice created on 01/25/2018 13:34:56 and created by Brian Lall ***
1: The tech called and stated the harness has been installed and they are going to drive the vehicle tonight for testing and will update the case with the result in the morning. There was also a question about trying to open a PWA for the short block that was already replaced. Advised if a PWA case was opened now techline cannot approve it unless an appeal is approved through the warranty department. Advised the appeal needs to be submitted by the DPSM and RPSM and if the DPSM needs clarification or more information they should contact the warranty department.

*** 01/26/2018 06:13:57 ***
Web - Note created on 01/26/2018 06:13:56 and created by MIKE CASE
I have driven approximate 80 miles no misfires . Engine still feels rough like a misfire but no code

*** Web - Advice created on 01/26/2018 09:07:17 and created by Brian Lall ***
1: Does the engine have a lack of power at all. This case has been going on a long time and has been very involved so we need some new basic checks at this point. Hook up a vacuum gage to manifold vacuum and note the reading at idle. As you snap the throttle (a good full snap), the vacuum will drop to zero and then go up above the idle reading before dropping back down to the idle reading. We are looking for the highest reading after it drops to zero. If the vacuum does not go up higher than at idle, check the exhaust for restrictions.
2: Please check the running and residual fuel pressure on the high and low side. Note the fuel pressure with the engine running (for the high pressure note the actual and desired pressure), when it is shut off, then 5 and 10 mins after it has been shut off. Please also take a fuel sample and check for any obvious contamination and alcohol content. Note the % of alcohol in the case notes. If it is safe to do so put a very small amount of the fuel in a metal pan and away from everyone and everything flammable light it and let it burn off or just let it evaporate. Note if it ignites easily and if there is any oily or other residue left after it burns or evaporates. Let me know what you find. Thanks.

*** 01/26/2018 14:00:13 ***
Web - Note created on 01/26/2018 14:00:13 and created by MIKE CASE
It lacks power when cylinder is in active misfire 2 . This engine has been rebuilt for this reason . It has had injector driver module replaced and has had pcm installed. I have also installed and engine harness to correct this. It has multiple fill up at different brands. FTS has been out Jim believed it to be mechanical last time thats when we put short block and head .

*** Web - Advice created on 01/29/2018 05:00:35 and created by Brian Lall ***
1: When the engine was replaced were the injectors, intake, or other components replaced?

*** 01/29/2018 05:26:56 ***
Web - Note created on 01/29/2018 05:26:56 and created by MIKE CASE
Injectors have been replaced with the injectors harness . No intake was replaced

*** Web - Advice created on 01/29/2018 05:55:38 and created by Brian Lall ***
1: An FTS is being requested due to previous FTS intervention, continue with diagnosis until further notice. Please provide the following information:
Name of technicians working on the vehicle:
Technicians phone number:
Is the vehicle at the dealership?
2: Please remove all the spark plugs and inspect all the cylinders with the pistons at BDC for damage to the cylinder walls or

to the pistons.
3: When the engine was replaced were the heads replaced or sent to the machine shop at all?

*** Web - Note created on 01/30/2018 09:02:34 and created by Luis Hernandez ***
FTS is tentatively scheduled for 2/5/2018.

1: Hello Christopher

Based on the information that you have provided the engine will need to be replaced

Before I can give approval I need you to please complete, sign and attach the REVISED WRTY143 Core Data Form dated 11/1/16 as outlined in Pit stop PS410 to this case to proceed. The form must have the RO#, mileage, date, VIN and be signed by technician and service manager.

,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Please add a case note so I will be made aware that the form is there, Thank you

*** 10/31/2017 14:36:58 ***

*** Web - Advice created on 10/31/2017 15:14:09 and created by Frank Lusic ***
1: Thank you
Based on the information you have provided, you are authorized to replace the engine. Please follow all outlined procedures, and utilize only parts and labor ops associated with SC147. If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. I am authorizing the PWA and closing the case. Thanks.

*** Web - Advice created on 11/01/2017 08:17:29 and created by Frank Lusic ***
1:
Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- ❑Replace the engine with a long block, if available; otherwise, please order a short block assembly

- ❑If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

- ❑If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- ❑Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

- ❑If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

- ❑Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

*** Web - Advice created on 11/04/2017 07:29:36 and created by Chris Schang ***
1: Rodney,
1: Note, use the KDS to actuate the cooling fan in high and low speeds to see if the system is functioning correctly.
2: Next perform Technician basics TB009 than list the results.
3: Note, when perform the leak down test make sure the radiator cap is remove so you can see if coolant is pushing back out the fill neck when performing the leak down test.

*** 11/06/2017 14:10:21 ***
Web - Note created on 11/06/2017 14:10:21 and created by Rodney Ledet
used KDS to actuate cooling fans = fans are operational

performed cylinder leak down test and results are as follows- #1=5%, #2=5%, #3=5%, #4=5%, #5=7%, #6=10% with bubbles in cooling system.
it appears cylinder #6 has a leak into the cooling system.

*** Web - Advice created on 11/06/2017 14:24:12 and created by Chris Schang ***
1: Thanks Rodney,
Please get DPSM labor authorization to remove the front cylinder head and inspect for warpage using a straight edge and feeler gauge. You may also want to inspect for any leakage on the rear cylinder head. Please take note of any abnormally loose head bolts and be weary that none of the head bolts take the block threads with them. Let me know what you find. Thanks!

*** 11/09/2017 14:38:10 ***
Web - Note created on 11/09/2017 14:38:10 and created by Rodney Ledet
removed left cylinder head. upon removal found head bolts took little effort to remove especially around cylinder #6.
visual inspection of head bolts found threads from engine block on one head bolt. (see attachment)
measured cylinder head warpage of 0.005".

Hello, c/s the vehicle is leaking large amounts of engine oil.

*** 11/13/2017 09:57:51 ***
Web - Diagnostics created on 11/13/2017 09:57:25 and created by Greg Nelson
Found excessive hydro carbons(50+HC ppm) in cooling system and large amounts of engine oil in the cooling system. Removed cylinder heads and found most of the head bolts loose. Left head has .004" warp and the same for the opposite, like its been over heated bad. Looking for direction, thinking all the coolant hose's need to be replaced and the hard components flushed along with engine replacement due to the large amount of oil found in the cooling system. Found an older case that stated the coolant was leaking from a exhaust stud. Look like the timing cover had been resealed. Thanks for your assistance.

*** 11/14/2017 17:42:28 ***
Web - Note created on 11/14/2017 17:42:28 and created by Greg Nelson
Hello, so we heard back from the guest today and they said the vehicle has not over heated as far as they know. I was just referring to the tear down of the heads, since the head bolts felt "not tight" when removed, thought that the engine appears to have been over heated. The oil leaks are from the coolant reservoir, two pictures show the oil leaking from the reservoir all over the engine compartment coming through the cooling system. Most likely from the head gaskets, hence the head bolts feeling loose. I will be out of the shop until next week, but I will forward your response to my service manager to keep this rolling. Thank you.

Web - Note created on 11/20/2017 08:46:13 and created by Greg Nelson
Hello, we did not measure any more due to the threads in the left bank of the block have been damaged. Reason for the bolts feeling loose during dis-assemble. I have added a picture of the cam shafts for the left head and the bearing caps. They have not been cleaned. Thanks, I will also note of the cleaning we will need to do to the whole cooling system due to the engine oil that has mixed in the coolant. My experience on these types of repairs (oil in cooling system), tend to see the hose damage take some time to develop.

*** Web - Advice created on 11/22/2017 06:15:18 and created by Mike Ozonur ***
1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly
- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

2: If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. If the engine is equipped with a turbo then it should be replaced as well as the oil feed line to it.

Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.
Thank you.

1: Based off of your information you will need to open a PWA case for warranty authorization for approval to replace the engine. Follow the listed information.

Open a required PWA for approval to replace the engine and update and close this case and perform the Technician survey. Please review the warranty bulletin 2015-09 (sent to your dealer) and attach the completed and signed WRTY143 Core Data Form to the PWA case or the warranty process will be delayed.
Thank you.

confirmed threads pulled out, did not hold, what next

*** Web - Advice created on 11/22/2017 15:10:31 and created by Frank Lusic ***
1: Based on the information that you have provided the engine will need to be replaced.
If the warranty is still valid, please open a PWA case
You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form dated 11/1/16 to the case with both the service manager and technician signatures on it. Thanks
,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments.

2: If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.
Please close this case and open a PWA case and complete the survey

*** 11/30/2017 06:57:23 ***
Web - Note created on 11/30/2017 06:57:23 and created by Radoslaw Wojtowicz
installed new short block, cleaned and reused cylinder heads, water temp assembly appeared to be distorted as a result of bottom end failure so i replaced that. all looks good at this time, thank you

*** Web - Advice created on 11/30/2017 08:19:21 and created by Frank Lusic ***
1: Great news, Thank you for working so hard to repair this issue, Please close this case when the vehicle is finished and do not forget to take the survey for a chance to win $500, I would appreciate a 5 rating if you think that I deserve it, If not then please let me know how I could have done better,
Thanks again Frank L.

*** Web - Advice created on 11/30/2017 05:47:06 and created by Steven Okimura ***
1: Measure the cylinder heads for flatness, if out of specs Kia does not recommend resurfacing and replacement will be necessary.

Based on the information provided the engine should be replaced. You are required to open a separate TL PWA Case to gain authorization for engine replacement approval PRIOR to replacement, attach the revised Engine core data sheet to the case (form WRTY143) dated 11-1-2016 and reference this techline case number in your notes. Information for this process can be found in Warranty Bulletin 2016-22.

1: I have reviewed the previous assistance case #12558562. The engine has failed due to the head bolts came loose due to the block failure. Please continue repairing the vehicle.
2: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly
- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

- ❑If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.
  The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.
- ❑Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Web - Problem Description created on 12/04/2017 09:22:38 and created by Wyatt Brown
I am experiencing a coolant leak, which seemed to be coming from the front bank, rear, below the coolant thermostat control housing. I replaced the part, as the senior Kia technician at my dealer stated it has occurred before, and it seemed to be coming from that area, near the gasket surface, rear of head. However, the problem has persisted, and opening a techline case should be my next step. Upon closer examination, it appears to be coming from the rear front corner of the head, dripping down the bellhousing.

1: Matt please verify if the customer has valid service records and has followed the maintenance intervals recommended in the owner's manual. If records are not available please pull valve cover and take a photo of valve train and attach to the case. Let me know when it is uploaded.

2: Before approval can be granted on this PWA request for engine replacement, please complete and sign the WRTY-143 core data form and ask your Service Manager to sign it as well. Attach the completed form to the case and add a case note informing us that you have done so. Please refer to Warranty Bulletin 2015-09 for more information. Once the form has been received, I will process your request. Be sure to use the newest form revised 11/1/16 that available at Kdealer under warranty documents.

Customer states vehicle overheating while driving

*** 12/05/2017 07:09:53 ***
Web - Diagnostics created on 12/05/2017 07:09:53 and created by Scott Hamer
Verified concern-Found vehicle severly overheating- performed pressure test and found coolant leaking from front cylinder head. Removed front cylinder head and found some residue also at rear head-removed both cylinder heads to sublet to have checked. During removal of cylinder head bolts found threading from inside engine block coming off and sticking to head bolts. This happened on several of the head bolts. Need to replace engine short block. Both cylinder heads needed to be cleaned and reconditioned at machine shop.

1: Hello Dirk
Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

00000000• ☐Replace the engine with a long block, if available; otherwise, please order a short block assembly

☐If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly) inspect the original cylinder head thoroughly to determine whether head replacement is required

DDDDDD□• DIf a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

2:• □Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

□If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

□Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

1: Hello Phillip
1, I have seen cases where the oil cooler will leak oil into the cooling system but I do not believe that this engine has one
2, on the 3.3 there have been cases where the threads will pull out of the block for the head bolts allowing coolant and oil to leak, to determine this you will need to remove the cam shafts, loosen all head bolts, if any are already loose then this one may be the one that is causing this concern, try re torqueing these bolts to determine if the threads in the block will hold, please report your findings
2: Also can you please attach a picture of the oil in the coolant recovery tank to this case, thank you

1: Based on the information that you have provided the engine will need to be replaced.
If the warranty is still valid, please open a PWA case
You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form dated 11/1/16 to the case with both the service manager and technician signatures on it. Thanks
,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments.

2: If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.
Please close this case and open a PWA case and complete the survey

1: Hello Paul
Based on this information the cylinder head or heads will need to be removed for inspection (on the bank that is leaking), There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

1: I have reviewed the previous assistance case #__12570298_. The threads have been stripped out of the block causing the leakage.
2: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- □Replace the engine with a long block, if available; otherwise, please order a short block assembly
- □If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect the original cylinder head thoroughly to determine whether head replacement is required
- □If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- □Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the

intake runners, OCV, CVVTs, and timing components.

ODD ODD OD• ☐If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

☐Make sure all of th

1: Please check the engine oil and transmission fluid level and condition and note what you find in the case.
2: Please perform a block check, then with the engine at operating temp so the thermostat is open, remove the oil filter and carefully pressure test the cooling system (making sure not to get burned when removing the radiator cap or pressure testing). Note if you can see any coolant going into the oil filter housing and if the cooling system is loosing pressure. Thanks.

*** 12/22/2017 11:41:19 ***
Web - Note created on 12/22/2017 11:41:19 and created by Nici Roots
CHECKED TRANS AND ENGINE OIL LEVELS AND THEY ARE GOOD. REMOVED OIL FILTER DURING PRESSURE TEST AND FOUND COOLANT IN THE OIL FILTER HOUSING. COOLING SYSTEM DOES NOT SEEM TO BE LOOSING PRESSURE. INSPECTED TRANS FLUID AND FOUND THAT IT IS DARK, BUT DOES NOT HAVE THE SAME SMELL THAT THE COOLANT DOES OF MOTOR OIL.

*** 12/22/2017 12:01:24 ***

THE BLOCK TEST COLOR DID NOT CHANGE

*** Web - Advice created on 12/22/2017 12:58:43 and created by Brian Lall ***
1: Based on the information you provided, my recommendation is to replace the oil filter housing and to flush all the oil out of the cooling system. Make sure to replace any components that are swollen or damaged from the oil contamination.

*** Case has been auto closed by the system on 01/22/2018 01:02:52 (PST)
*** 02/06/2018 15:15:21 ***
Case Number: XXXXXXXX Reopen Requested by Nici Roots.
Reason: [Vehicle has returned with same concern, apparent oil contamination of cooling system.
Please re-open and transfer case to Chris Schaefer.]

*** 02/07/2018 08:08:04 ***
Reopened with Sub Status of Working

*** Web - Advice created on 02/07/2018 08:08:36 and created by Brian Lall ***
1: Chris, thanks for letting me know the vehicle is back and you are now working on it. Please check the cooling system and engine for any coolant leaks internal or external and perform a block check. Let me know what you find. Thanks.

*** 02/07/2018 10:51:35 ***
Web - Note created on 02/07/2018 10:51:35 and created by CHRISTOPHER SCHAEFER
I have pressure tested the cooling system. The system holds pressure. The odd thing is, the leak appears to be one directional. There is oil in the cooling system, but no coolant in the engine oil or the transmission fluid.
Nici performed a block check during the last repair attempt. No leaks were found.

*** Web - Advice created on 02/07/2018 11:02:17 and created by Brian Lall ***
1: I am not sure what the cause of the mixing may be but the oil is generally under a higher pressure than the cooling system so it will go that way and not the other.
2: If you apply some regulated air pressure (not full shop pressure) to the oil dipstick tube are there any bubbles or signs of air in the radiator or cooling system?

*** 02/07/2018 14:24:24 ***
Web - Note created on 02/07/2018 14:24:24 and created by CHRISTOPHER SCHAEFER
I applied air pressure through the dipstick tube. No bubbles or movement of the coolant in the radiator.
I also removed the engine oil filter and applied air pressure through the lubrication system, also without any result.
It's looking more and more like we'll have to disassemble the engine and closely inspect the head gaskets, etc for the source of the leak.

*** Web - Advice created on 02/08/2018 06:05:21 and created by Brian Lall ***
1: Is the oil or transmission fluid level low at all?

*** 02/08/2018 07:58:52 ***
Web - Note created on 02/08/2018 07:58:52 and created by CHRISTOPHER SCHAEFER
The engine oil level was slightly low, maybe 1/4 to 1/2 quart.

*** Web - Advice created on 02/08/2018 08:31:24 and created by Brian Lall ***
1: It is unclear where the oil is coming from. It could be a porous block, bad casting, or even a damaged head gasket. Please contact your DPSM to find out if they want to authorize having you remove the heads and inspect to try and find the source or if they would like the engine replaced. Thanks.

*** 03/01/2018 09:51:16 ***

*** 03/01/2018 09:54:03 ***
Web - Note created on 03/01/2018 09:54:03 and created by CHRISTOPHER SCHAEFER
I have removed the engine from the vehicle and torn it down. During disassembly, I found a headbolt on the left cylinder head,

between cylinders 4 and 6, was loose, not even finger tight. In fact, by comparison to the right bank, all the left bank bolts were loose.
The bolt in question is adjacent to an oil passage, and there is on oil stain on the head gasket within the water jacket area. I believe this is the source of the leak..
I have attached a couple of photos of the affected area to this case.

*** Web - Advice created on 03/01/2018 10:01:25 and created by Brian Lall ***
1: Thanks for the information. Please check the heads for warpage or damage. Let me know what you find.
2: Please also check the head bolts to see if the threads from the block were damaged or came out on the bolts. Please also try to inspect the bolt holes for signs the threads in the block have been damaged. Let me know what you find. Thanks.

*** 03/01/2018 10:19:58 ***
Web - Note created on 03/01/2018 10:19:58 and created by CHRISTOPHER SCHAEFER
I am sending the head out to the machine shop to make sure it's not warped.
The bolts came out clean, the threads on the bolts and in the block are in good condition. It appears they were never torqued correctly. There is no warranty history on this vehicle, so it's unlikely it's due to an unsuccessful repair.

*** Web - Advice created on 03/01/2018 10:24:02 and created by Brian Lall ***
1: I have seen damaged threads in the block for head bolts on this engine after overheating or at times even causing coolant or oil leaks. Please see if you can install a head bolt in the hole for the one that was loosest and see if it will torque to the first step of 27.5 ~ 30.4 lb-ft. Let me know if the bolt tightens or if it does not. Thanks.

1: Thank you for the information, The core form is filled out. Thank you for the pictures of the stripped out bolts. Please replace the short block and re use the heads if possible.
2: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

□Replace the engine with a long block, if available; otherwise, please order a short block assembly

□If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect the original cylinder head thoroughly to determine whether head replacement is required

□If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (rf any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

3: • □Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.
ODO ODO□□• □If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

□Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

1: Kevin, sorry the Agent handling your assistance case missed this, but your dealership is a DSA Level A dealership. This means that you are self authorizing and do not require prior Warranty authorization, as long as it is not an SC147 related case. If your diagnosis has determined that the component has failed, has not been neglected or damaged due to impact, is not a used or junk yard part, and you have verified that the warranty is valid and all necessary services have been performed, then replace as necessary. I am going to close and deny this PWA case since your dealership does not require a PWA case.

1: • Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly
- If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly inspect the original cylinder head thoroughly to determine whether head replacement is required,
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

2: If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. If the engine is equipped with a turbo then it should be replaced as well as the oil feed line to it.
Make sure all the ladder frame bolts are installed in the replacement short engine, if applicable.
Thank you.

1: Thank you for all the attachments. Since this is a block failure possibly due to stripped head threads the maintenance has not had an affect on the engine. I can see the milky build up on the oil cap. Thank you again.
2: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

☐Replace the engine with a long block, if available; otherwise, please order a short block assembly

☐If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect the original cylinder head thoroughly to determine whether head replacement is required

☐If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (rf any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

3: • ☐Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.
ODD ODDDD• ☐If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

☐Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

1: This is not an approval to replace the engine assembly only a recommendation. check if warranty is still valid....
Recommend to replace he engine assembly, Replace the engine with a long block, if available; otherwise, please order a short block assembly
• If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly inspect the original cylinder head thoroughly to determine whether head replacement is required,
• If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

2: If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. If the engine is equipped with a turbo then it should be replaced as well as the oil feed line to it.
Make sure all the ladder frame bolts are installed in the replacement short engine, if applicable.
Thank you.

1: Based on information you provided engine needs to be replaced, if the warranty is still valid you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY143 Core Data Form to the case with both the service manager and technician signatures on it.

Web - Problem Description created on 01/11/2018 08:43:17 and created by ALDEN FREEMAN
When the heat is on high vehicle will blow cool air.

*** 01/11/2018 08:55:04 ***
Web - Diagnostics created on 01/11/2018 08:43:17 and created by ALDEN FREEMAN
Verified customer concern that the heat isn't working properly. Checked coolant level in overflow tank level is full. Removed radiator cap to find radiator was less than half full. Filled
radiator up and let the vehicle run to remove any air in system. Upon revving the engine noticed bubbles in the overflow tank. After revving a few times coolant began spraying out
of overflow tank. Removed radiator cap after letting vehicle cool down and an excessive amount of pressure was released into overflow and could smell gas in radiator. Tested
coolant to find combustion in coolant. No signs of vehicle over heating but definitely has signs of faulty head gasket.

1: Hello Alden
We need to check to see if any of the threads for the head bolts are pulled out of the block
Please remove the cam shafts, check to see if any of the head bolt are loose,
then loosen all of the head bolts, then re torque them to see if the threads pull out of the block

*** 01/18/2018 12:43:11 ***
Web - Note created on 01/18/2018 12:43:11 and created by ALDEN FREEMAN
Found head bolts 5 and 6 according to the head removal procedure on the left side head (bank 2) that are loose. Tried to re torque bolts but head bolts didn't tighten down just kept

spinning.

*** Web - Advice created on 01/18/2018 13:54:44 and created by Frank Lusic ***
1: Based on the information you have provided the engine will need to be replaced, Since your dealership is a DSA dealer PWA approval is not necessary. Based on this this case will be denied, Thank you

1: Your completed and signed WRTY143 core data form has been reviewed. Based on the information you have provided, you are authorized to replace the engine. Note:

- Replace engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect thoroughly to determine if head replacement is required

- If a cylinder head is required, re-use any parts that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason on your hard copy and replace the component.

- If equipped with a turbo, be sure to check the turbo and oil feed line as well. Replace the turbo, oil feed line and banjo bolt if build up, metal debris or excessive wear to the turbo are found.

- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the manifold with a NEW one.

*** Web -Advice created on 01/11/2018 12:50:52 and created by Eric Patterson***
1: Please pull the valve cover and check the head bolts and see if any of them are loose and will not take a torque of 90 ft lbs. We have had cases where the block has stripped threads causing the head gasket leaks. Please also include a picture of the valvetrain for the maintenance verification.

*** Phone -Advice created on 01/12/201810:04:40 and created by Eric Patterson***
1: We have found three of the bolts are stripped in the block from the head bolts. There has been a lot of Metal throughout the engine. The cam lobes and journals are worn. The valves may be salvageable.
The cylinder heads are warped as well measuring .005. There is no longer a long block available for this application.
2: Please replace both chains and tensioners , camshafts, CVVT's and the OCV's, cylinder heads, reman short block and oil pump.

3: The vehicle also has a misfire when cold and the injectors are carbon fouled on the tips. Please replace the fuel injectors with the updated parts numbers in TSB FUE 035

*** Web - Advice created on 01/12/2018 13:39:44 and created by Steven Okimura ***
1: If you discover the head bolt threads are damaged in the block it could cause your concern. Verify the engine should be covered under warranty by removing the valve cover and attach photos of the valve train to the case. Check the had bolt torque, if the threads are damaged, the bolt will be loose and you will be unable to torque the bolt to specs.

1: • Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly
- If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly inspect the original cylinder head thoroughly to determine whether head replacement is required,
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

2: If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. If the engine is equipped with a turbo then it should be replaced as well as the oil feed line to it.
Make sure all the ladder frame bolts are installed in the replacement short engine, if applicable.
Thank you.

first found smell of coolant under hood, found alot of coolant on top of trans. radiator had no coolant nor did resivior, filled radiator with water and performed pressure test. raised pressure to 20-25psi no severe leaks. but pressure would drop very slowly. decided to check for internal leaks and found severe coolant/oil build up in filler neck. My prognosis is started with coolant leak, causing overheating, blowing head gasket, now coolant poured into engine internally ... please see attachments, and advise on next step

1: Thanks for the pictures. It is hard to tell since they are not clear but to me it looks like there was pitting and damage to one piston and coolant in the other cylinder. Is that correct?

*** 01/18/2018 13:16:30 ***
Web - Note created on 01/18/2018 13:16:30 and created by Justin Dimapasoc
yes. sorry that was the clearest picture i can get

*** Web - Advice created on 01/18/2018 13:20:13 and created by Brian Lall ***
1: I know it was a bore scope picture, no worries. Thanks for confirming. Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL. Make sure to verify all cooling system components are not leaking and the fans are working as designed after the repair or the new engine may become damaged.
2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head if needed. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one.
3: If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

1: hello Travis

Based on the information that you have provided the engine will need to be replaced

Before I can give approval I need you to please complete, sign and attach the REVISED WRTY143 Core Data Form dated 11/1/16 as outlined in Pit stop PS410 to this case to proceed. The form must have the RO#, mileage, date, VIN and be signed by technician and service manager.

,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .

Please add a case note so I will be made aware that the form is there, Thank you

1: Tim, please measure the head surface for warpage and attach one or two clear photos of the valve train (to verify maintenance). If you have only removed the one head, and cleaned it, please remove the other cover and get your photos from the other head. And please make sure that there are no other external leaks or fan issues that could have caused this to overheat.

If you have verified proper maintenance, verified that there is no build up in the engine or other signs of neglect, the engine has not sustained any external impact, it is not a used or junk yard motor, and the warranty is still valid according to Web DCS, please refer to warranty bulletin 2015-09 and attach the core data sheet WRTY143. It will need to be filled out, signed by both you and your service manager (no electronic signatures or stamps), dated and attached to this PWA case before it can be approved.

1: Justin, do you remember exactly which two bolts these were? Or can you tell by looking at the block?

Core data sheet is complete and the assistance case has been reviewed.

*** Web - Advice created on 01/27/2018 11:17:20 and created by Greg Phillips ***
1: Justin, sorry this was missed in the assistance case but, you don't actually need a PWA case. Your dealership is a DSA Level A dealership. This means that you are self authorizing and do not require prior Warranty authorization, as long as it is not an SC147 related case or a parts warranty. If your diagnosis has determined that the component has failed, has not been neglected or damaged due to impact, is not a used or junk yard part, and you have verified that the warranty is valid and all necessary services have been performed, then replace as necessary. I am going to close and deny this PWA case since your dealership does not require a PWA case.

Do please still let me know which bolts were loose if you can though.

*** Web - Advice created on 02/09/2018 14:51:40 and created by Tony Thomas ***
1: Thanks for the update.

*** 02/19/2018 07:28:40 ***
Web - Note created on 02/19/2018 07:28:40 and created by Matthew Stearns
hello writing back to update, 2 bolts loose and 3 bolts on head bank 2 not coming loose, , dpsm say customer is ultimately responsible for concern and condition due to letting viecle overheating in past. do you recomend using heat to remove bolts that are siezed? wouldnt this dagage head and short block? do we go about replacing both head and shortblock?

*** Web - Advice created on 02/19/2018 08:12:26 and created by Brian Lall ***
1: Thanks for the information. Since you found loose head bolts it indicates the threads in the block are damaged and the short block will need to be replaced. There is also a strong possibility that the head may be warped or damaged and will need to be replaced but there is no way to be sure until it is removed. You can try heating the seized bolts but be careful not to damage the head.
2: Based on the information you provided, my recommendation is to get authorization from the customer to replace the engine. The question is now if the short block should be replaced or if the heads are damaged and a long block should be replaced. Thanks.

Title: Medford Sorento - Techline Case

*** Phone - Advice created on 02/19/2018 14:21:12 and created by Eric Patterson ***
1: Thanks for calling in Ken on the case. After review, please contact Brian in the Morning on the case.

*** Phone - Advice created on 02/20/2018 13:00:26 and created by Brian Lall ***
1: Ken Dominguez, the DPSM, called and advised me he contacted the dealer and he confirmed that the front end collision that damaged the radiator and other front end components was about 1 1/2 years ago. Ken feels that since the collision was so long ago that the engine failure may not be related and there is no way to prove the damage to the engine is related to the collision. I advised I agree and will note the conversation in this case and will re-open the PWA case 12616747 and will continue the PWA process until all needed information is collected to approve the engine replacement.

*** Web - Advice created on 02/20/2018 13:04:57 and created by Brian Lall ***
<For Internal Use Only
I misspelled the DPSM name. The correct spelling is Ken Domingues. I apologize for the type-o.>

1: Hello Dave
remove the oil filler cap and check inside to see if there is any oil jell inside that might indicate there is coolant in the oil
2: Please perform the Block Test inspection, please use this method, with the vehicle fully warmed up, test drive the vehicle again and perform a couple hard accelerations and then when the vehicle is back in the service bay remove the cap from the coolant recovery tank and immediately test the air inside the recover tank, Please report your findings

*** Web - Advice created on 01/31/2018 10:43:57 and created by Frank Lusic ***
1: Thank you
Based on this information the cylinder heads will need to be removed for inspection (, There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

Tech has removed both cylinder heads states there is a .05 warpage on rear head and .03 on frt head . Believes that the heads may require replacement as well ...?

*** Web - Advice created on 02/14/2018 08:32:45 and created by Frank Lusic ***
1: Thank you, Yes both heads will also need to be replaced
Based on the information that you have provided the engine will need to be replaced.
If the warranty is still valid, please open a PWA case
You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form dated 11/1/16 to the case with both the service manager and technician signatures on it. Thanks
,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments.

2: If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.
Please close this case and open a PWA case and complete the survey

1: Your completed and signed WRTY143 core data form has been reviewed. Based on the information you have provided, you are authorized to replace the engine. Note:

- Replace engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect thoroughly to determine if head replacement is required

- If a cylinder head is required, re-use any parts that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason on your hard copy and replace the component.

- If equipped with a turbo, be sure to check the turbo and oil feed line as well. Replace the turbo, oil feed line and banjo bolt if build up, metal debris or excessive wear to the turbo are found.

- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the manifold with a NEW one.

1: Brandon, the milky looking oil is from the coolant mixing with oil. I have seen this many times with blown head gaskets, and is usually a result of overheating. This could be a result of the coolant leak from the head gasket or that could be a result of the overheating. Did you find a root cause for the over heating?
2: Please check if any of the head bolts are loose. If they are try to torque them and note if they will tighten up. If you remove any head bolts and there are indications of the threads from the block coming out on them take pictures and attach them to the case. Thanks.

1: Thanks for the picture and video. Please remove the heads and check for warpage and damage to the heads. Based on the stripped threads in the block my recommendation is to replace the engine, the question is do the heads need to be replaced or can they be reused.

*** 02/01/2018 07:47:10 ***
Web - Note created on 02/01/2018 07:47:10 and created by Brandon Seeley
Removed the back cylinder head and checked it with the straight edge and feeler gauges. Found a spot on the back side that is measuring at .06mm which is above the max allowed per kia spec.

*** Web - Advice created on 02/01/2018 07:53:45 and created by Brian Lall ***
1: Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.
2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head if needed. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one.
3: If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:
1,Replace the engine with a long block, if available; otherwise, please order a short block assembly2,If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect the original cylinder head thoroughly to determine whether head replacement is required□O□If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.4, Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CWTs, and timing components. 5, If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.6, The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.
7, Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

1: hello Bobby

Based on this information the cylinder head or heads will need to be removed for inspection (on the bank that is leaking), There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** 02/26/2018 09:03:48 ***

*** Web - Advice created on 02/27/2018 10:11:36 and created by Frank Lusic ***
1: Thank you for this information.0008 is the max allowable
based on this information the engine will need to be replaced as a long block
2:
Based on the information that you have provided the engine will need to be replaced.
If the warranty is still valid, please open a PWA case
You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form dated 11/1/16 to the case with both the service manager and technician signatures on it. Thanks
,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments.

3: If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.
Please close this case and open a PWA case and complete the survey

*** 03/01/2018 07:46:25 ***

1: The completed and signed WRTY143 engine core data form has been received and reviewed.
Based on the information you have provided, you are authorized to replace the engine following normal service procedures.

- Replace the engine with a long block, if available; otherwise, please order a short block assembly. If the short block is replaced, replace the oil pump or BSM (make sure to count the teeth on the gear prior to assembly), inspect the original cylinder head thoroughly to determine whether head replacement is required.
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (If any cannot be transferred, supporting documentation will be required at the time of warranty claim submission.)
- Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Make sure the ladder frame bolts are installed in the replacement short engine, if applicable.

Warranty cases are closed for approval and you will no longer be able to access this case.

1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- □Replace the engine with a long block, if available; otherwise, please order a short block assembly

- □If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly) inspect the original cylinder head thoroughly to determine whether head replacement is required

- □If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if

any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

2:

- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

- If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

- Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

lifted vehicle into air, coolant and oil leaking along back side of engine down rear of timing cover. removed intake plenumn to access rear cylinder head cover. removed cover, released tension from rear bank tensioner with kia special tool. removed cam caps, and camshafts post marking timing marks on chain and sprockets. out of 8 head bolts 5 released without much effort, LH front corner head bolt was removed but, RH rear corner was unable to be removed. inspected bolts upon each removal, one had slight thread shavings of block on bolt threads. re-threaded bolts in to torque in sequence. Middle LH rear (where leak was noticed) threaded in part way but would not seat. removed with threads from cylinder block. needs long-block if available. since Kia of Puyallup is no longer an A level dealer we need information if to order a standard re-man or QQK?

going to upload photos to case, should be an additional 5 minutes

1: I reviewed the repair assistance case and the C/A case and both indicate that this is not the original owner and the vehicle no longer had a valid powertrain warranty then that was changed and the system now shows that the customer is the original owner. Have you verified there is a valid powertrain warranty?
2: Thanks for the PWA form. If you can see any damage to the threads such as where they came out on the head bolts or any other damage take pictures of the damage and attach them to the case. Thanks.

*** 02/19/2018 12:38:15 ***
Web - Problem Description created on 02/19/2018 12:37:07 and created by Alan Everts
customer states oil in coolant reservoir and oil leaking. confirmed dirty engine oil in radiator and overflow bottle, leak is from overflow bottle forcing fluid our of bottle.

*** 02/19/2018 12:38:15 ***
Web - Diagnostics created on 02/19/2018 12:37:07 and created by Alan Everts
oil is in cooling system and there is some coolant, heavily mixed. do not see coolant in oil, but see some metallic contamination (bearing material). coolant hoses are all soft and mushy. no external leaks other than from overflow bottle and no evidence of previous engine type of repair. no codes stored in engine or transmission. oil level is at low mark on dipstick and is just due for oil change according to window sticker.

*** 02/19/2018 13:01:48 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin Default

*** Web - Advice created on 02/19/2018 13:02:50 and created by Eric Patterson ***
1: Thanks for the information. Please look under the vehicle and see if there are any signs of external coolant leakage on the head gaskets.
2: Please perform a block check when the vehicle is warmed up and see if the fluid color changes and please attach a picture of the ending result to the case.

*** 02/20/2018 14:39:11 ***

*** Web - Advice created on 02/20/2018 16:07:34 and created by Eric Patterson ***
1: The customer stated leaking, was that due to the overflow tank?

Please empty the reservoir and clean it out and road test and check the level when hot. See if the vehicle overheats, the picture looks more like oil than coolant.
2: Please let me know if the reservoir goes over the full line and starts to bubble or get abnormally high and if the vehicle overheats.

*** 02/20/2018 16:15:29 ***
Web - Note created on 02/20/2018 16:15:29 and created by Alan Everts
yes

*** Web - Advice created on 02/20/2018 16:19:49 and created by Eric Patterson ***
1: You have already did it?

*** 02/20/2018 17:05:45 ***
Web - Note created on 02/20/2018 17:05:45 and created by Alan Everts
sorry did not see 2nd part of advice, I really don' t want to drive this thing due to hoses condition. one of the heater hoses has a bulge sticking out and is very soft. all hoses are very soft and mushy as previously stated.

*** Web - Advice created on 02/21/2018 07:35:54 and created by Eric Patterson ***
1: When the block check was performed was the coolant flowing through the radiator?

Was it hot at operating temperature?
If you warm the vehicle up and remove enough fluid from the radiator as its running the exhaust gasses can flow through the system.

We need to find the failure before diagnosis. Pleas send a short video of the hoses and the conditions.

*** 03/15/2018 09:14:21 ***
Web - Note created on 03/15/2018 09:14:21 and created by Alan Everts
replaced, radiator all coolant hoses including hoses to AT cooler, replaced t stat, flushed heater core, cleaned overflow bottle and replaced overflow bottle hose. had vehicle driven over 500 miles and oil is accumulating again into overflow bottle and fluid appears to be now mostly oil instead of coolant. there is no contamination of coolant in the oil and the vehicle is not overheating, nor was it to begin with.

*** Web - Advice created on 03/15/2018 09:50:13 and created by Tony Thomas ***
1: Would have to be the heads or gaskets causing this. Get approval for tear down and make sure you torque check the head bolts before removal to see if any are not holding.

*** Service Alert Escalated to CA as: 12662635 on 03/16/2018 01:06:11 (PST)

*** 03/19/2018 17:22:30 ***
Web - Note created on 03/19/2018 17:22:30 and created by Alan Everts
was told by DPSM to remove valve covers and inspect head bolts for proper torque and if they are tight to replace long block. since head bolts are angle torqued can only check to see if they are tight, which they are.

*** Web - Advice created on 03/20/2018 07:55:00 and created by Eric Patterson ***
1: You will need to remove the camshafts and inspect the torque.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped near the affected leakage on the head gasket. Please also check for metal in the OCV's. If either of these two items has failed inspection, please let me know before continuing. Thanks

*** Web - Advice created on 03/21/2018 14:50:34 and created by Eric Patterson ***
1: I have received an email from the DPSM to replace the engine. I tried to get the block check to fail when the vehicle came in, either the test was not done correctly or the test could not pick up the gases in the system. Please close this case per the DPSM Joseph Hegmann and open a PWA case to replace the engine with a long block. No further testing is necessary.
2: You are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it. Please close the repair assistance case when you are finished with the case approvals.

Inspected found Vehicle is over heading, Found coolant leaking from head gasket, By the Exhaust bank 2, According to the other master tech head bolts be come louse and short block Thread gets pull, Any advice?

*** 02/20/2018 11:09:58 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 02/20/2018 11:11:13 and created by Frank Lusic ***
1: Hello Alfredo
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** Phone - Advice created on 02/22/2018 13:08:54 and created by Frank Lusic ***
1: Alfredo called in and said that the threads are pulled out in the block, I asked him to
Please remove the cylinder heads and inspect for warped heads by using a procession straight edge, if the head is warped let me know by how much thank you

*** 02/22/2018 17:24:52 ***
Web - Note created on 02/22/2018 17:24:51 and created by Alfredo Olguin

Remove both of the heads inspected them found no warped on any of theme, Any advice?

*** Web - Advice created on 02/23/2018 07:11:33 and created by Frank Lusic ***
1: thank you for this information, then only the short block will need to be replaced
Based on the information that you have provided the engine will need to be replaced.
If the warranty is still valid, please open a PWA case
You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form dated 11/1/16 to the case with both the service manager and technician signatures on it. Thanks
,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments.

2: If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.
Please close this case and open a PWA case and complete the survey

1: Perfect. Thanks for the video. The head bolts are stripped. If the heads are warped they will need replaced.
I have reviewed the pictures of the valve train. The condition of the engine shown in the pictures you attached to the case appears the engine has been maintained correctly.

2: Please attach the completed and signed WRTY143 [Rev. 11/1/2016] core data form to the warranty case. The form must be filled out (all available sections) and signed and dated by the Service Manager and The Technician.
3: If you can get this attached I can close the case as approved today and proceed with the engine replacement and inspect the cylinder heads and verfy if they need replacement. You are a DSA"A" dealer as well.

1: Thank you for the PWA form. Have a great weekend.
2: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

□Replace the engine with a long block, if available; otherwise, please order a short block assembly

□If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect the original cylinder head thoroughly to determine whether head replacement is required

DIf a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

3: □Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.
□□□□□□DD □If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.

□Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

1: Algeny, I would like you to access the head bolts on that side, and apply fastening torque to them and see if they just spin?

*** 02/26/2018 07:21:43 ***
Web - Note created on 02/26/2018 07:21:43 and created by Algeny Capellan
Remove valve cover I check head bolts on cylinder 2 applying no torque are loose and yes they just spin no force on it

*** Web - Advice created on 02/26/2018 07:34:50 and created by Jameson Phillips ***
1: You're going to need to pull the heads and check for deck flatness on the cylinder head. Please verify your measurements in the case whether they are within, or out of spec per KGIS. Then I will provide further instruction.

*** 02/27/2018 08:58:09 ***
Web - Note created on 02/27/2018 08:58:09 and created by Algeny Capellan

I remove a head how to check the flatness on the head and on the Block check all around the head only on cylinder to surface 0.05 mm Rose through the straight edge all the cylinders are good the same thing on the head and on the Block goes to the bottom of the straight edge

*** Web - Advice created on 02/27/2018 08:59:48 and created by Jameson Phillips ***
1: Ok, that was a little unclear. The block is junk, so I don't care about that. I want to know what your exact surface variation is on the cylinder head deck.

*** 02/27/2018 10:55:11 ***
Web - Note created on 02/27/2018 10:55:11 and created by Algeny Capellan
I check cylinder head only cylinder 2 surface 0.05 mm cylinder 4 and 6 surfaces good I don't think this head is good and when I remove all cylinder head bolts only one was tight add notes found like a piece of wire metal inside the head attach photo

*** 02/27/2018 10:55:13 ***

1: I would recommend longblock replacement. Please refer to warranty bulletin 2015-09. You are required to open a techline engine PWA for request of authorization prior to ordering any parts, or performing any repairs. Please be sure to complete, and attach your WRTY143 core data sheet to the PWA case.

1: Thank you for the information.

When the valve covers are off please attach a picture of the front cams for the valvetrain maintenance inspection.
2: Then please perform a block check and add a short video or a clear picture of the fluid color after the color change please.
3: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped near the affected leakage on the head gasket. Please also check for metal in the OCV's. If either of these two items has failed inspection, please let me know before continuing. Thanks

Web - Problem Description created on 02/26/2018 15:53:30 and created by Nathan Pierce
Vehicle came in 20 days ago for an oil change. Upon inspection lube tech found what appeared to be oil in the overflow reservoir. Gave vehicle to me to DIAG and I pulled the thermostat and found the wax had been damaged as well as both radiator hoses had been swollen. I incorrectly speculated the thermostat had released the wax into the system and that was what was found. Performed pressure test and found no drop in pressure. Replaced thermostat and both hoses, Performed coolant cleanse and flush twice and found no further oil was showing up at that time. Customer stated Vehicle had never over heated on him. So coolant flush with cleaner detergent was done twice and vehicle was let go. Vehicle is back after it had started overheating and both hoses are very very pliable, there is evidence of oil all over the overflow bottle and oil is in the radiator. Ran vehicle until operating temperature but could not get an accurate engine block test.

*** 02/26/2018 16:02:40 ***
Web - Diagnostics created on 02/26/2018 16:02:40 and created by Siebel eSupport
Found oil level is slightly below where it was filled to 20 days ago. Attempted block check but could notnp get accurate test. Fluid turned yellow once but only after roughly 10 pumps. Pulled two samples into a clear tube. Oil is clean not milky

1: Thanks Nathan, please remove the cylinder heads and inspect for warppege. After review and if the valvetrain is clean, we will need to open the PWA case and if the heads are warped they will need replaced as well. If the heads pass the strait edge inspection, please send them to a machine shop for cleaning, pressure testing and seal replacement.

Please do not have the heads resurfaced. Please validate original customer and warranty for the powertrain coverage.

Thanks Nathan...
2: Thanks I received the information. The torque results from turning the head bolts. I have reviewed the pictures of the valve train. The condition of the engine shown in the pictures you attached to the case appears the engine has been maintained correctly. Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.
3: If proper maintenance and warranty are validated, Please close this case and open a required PWA case for warranty authorization to replace the engine. Be sure to attach the completed and signed WRTY143 [Rev. 11/1/2016] core data form to the warranty case. The form must be filled out (all available sections) and signed and dated by the service manager and technician. Add a note to the case when the form is attached. We are not notified of attachments. 1: • Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:
- Replace the engine with a long block, if available; otherwise, please order a short block assembly
- If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly inspect the original cylinder head thoroughly to determine whether head replacement is required,

- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

-

2: If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. If the engine is equipped with a turbo then it should be replaced as well as the oil feed line to it.
Make sure all the ladder frame bolts are installed in the replacement short engine, if applicable.
Thank you.

Vehicle came in due to check engine light on and flashing / running rough and overheating.

*** 03/01/2018 12:40:44 ***
Web - Diagnostics created on 03/01/2018 12:40:44 and created by Brandon Seeley
Had multiple misfire codes. no coolant in reservoir and rad was very low. I filled the radiator with water and pressure tested the system , found coolant leak externally at the head gasket , bank 2. when the engine is running is misfires pretty bad and I can hear tapping in the engine. I removed the oil pan to look for metal and to see the oil condition. The oil looks like it has coolant in it and I found a 10 mm bolt inside the pan , I am sure it was in there before I removed the pan. Would you suggest that I go ahead and do a leak down and compression test next. Thank you.

*** Web - Advice created on 03/01/2018 12:55:32 and created by Brian Lall ***
1: Yes, please do a compression test then a leak down test on all cylinders and note the percentage of leak down and note where the air is escaping from during the test (radiator, intake, exhaust, another cylinder, or crankcase) and inspect the spark plugs.

*** Service Alert Escalated to CA as: 12648788 on 03/02/2018 01:06:14 (PST)

*** 03/02/2018 08:52:39 ***
Web - Note created on 03/02/2018 08:52:39 and created by Brandon Seeley
compression : #1- 155 , #2- 155 , #3- 165 , #4- 145 , #5- 160 , #6- 160. Leak down test : I may have to re-do this test

because of the results but after putting each cylinder at top dead and applying 100 psi , #1- 2% , the other 5 cylinders showed a 90% leak and can feel air coming out of the intake. The spark plugs in bank 2 (where the head leak is) are covered in coolant and can see some coolant in the spark plug tubes , the other plugs are ok.

*** Web - Advice created on 03/02/2018 08:57:24 and created by Brian Lall ***
1: Please redo the leak down test and make sure that you are rotating the engine so each cylinder is at TDC when tested. You can refer to the valve adjustment procedure to make sure the valves are closed for the cylinder you are testing or just make sure the piston is at the top of the stroke and both cams have the lobes away from the lifters when you check. Thanks.

*** 03/02/2018 11:05:45 ***
Web - Note created on 03/02/2018 11:05:45 and created by Brandon Seeley
sorry about that. EXCEPT for cylinder 3 , all have 2-3 % leak down. Cylinder 3 has a 30% leak and the air is escaping through the radiator.

*** Web - Advice created on 03/02/2018 12:25:08 and created by Brian Lall ***
1: Thanks for rechecking and updating the information. Based on the test results, my recommendation is to get authorization to remove the bank 1 head and to check for warping, cracks, or damage to the head or block. If the head is warped it should be replaced, Kia does not recommend resurfacing heads. When you are removing the head check if any head bolts are loose or if any threads come out with the head bolts. If you find. that the threads in the block are damaged stop the head removal and let me know. Thanks.

*** 03/06/2018 06:46:42 ***
Web - Note created on 03/06/2018 06:46:42 and created by Brandon Seeley
I removed the cylinder head and I found a spot that I can fit a (.076mm) feeler gauge under the straight edge. I used a scotch brite pad to rub off the little bit of corrosion without digging into the head so I have a good reading. Spec says LESS than .05mm , so I would say this head is no good.

*** 03/06/2018 07:27:52 ***
Web - Note created on 03/06/2018 07:27:51 and created by Brandon Seeley
Also , I said that cylinder 3 had the air leak , It was actually Cylinder #4 , So I am looking at the Bank 2 head.

*** Web - Advice created on 03/06/2018 07:56:15 and created by Brian Lall ***
1: Thanks for clarifying. Based on the information you provided the head will need to be replaced. Did you find that any of the head bolts were loose when you removed the head? Please also check the block for damage or warpage. Let me know what you find. Thanks.

*** 03/06/2018 10:48:00 ***
Web - Note created on 03/06/2018 10:48:00 and created by Brandon Seeley
None of the head bolts were loose. I have a spot on the block where I can fit a .051mm but not a .076 , so the gap is somewhere between, which is just barely too high for spec. The way it ran before taking it apart, indicated internal problems also , I heard a metal tapping noise and it did overheat (unsure how many times) , but I would suggest that the block be replaced as well. There are no signs of sludge or lack of maintenance , looks pretty clean , let me know if you want any pictures.

*** Web - Advice created on 03/06/2018 10:56:05 and created by Brian Lall ***
1: The spec for the flatness of the block is the same as the head: Flatness of gasket surface
Less than 0.05mm (0.0019in.) Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.
2: • You are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it.
• Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.

Title: reman

*** Web - Advice created on 03/07/2018 11:49:52 and created by Frank Lusic ***
1: Thank you
Based on the information that you have provided the engine will need to be replaced again

Before I can give approval I need you to please complete, sign and attach the REVISED WRTY143 Core Data Form dated 11/1/16 as outlined in Pit stop PS410 to this case to proceed. The form must have the RO#, mileage, date, VIN and be signed by technician and service manager.

,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following
Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Please add a case note so I will be made aware that the form is there, Thank you

*** Web - Advice created on 03/08/2018 07:08:24 and created by Frank Lusic ***
1: Shane
the service engineer would like me to send your parts manager a special investigation request sticker so it can be applied to the reman engine box so it can be collected engine, I will need the following information so I can overnight this to him
1, the correct address for the dealer
2, his name
3, his phone number
4, him email address

2: then please do the following

- Remove the cylinder heads and all components swapped from the original engine
- Place the engine back in the container
- Affix the orange “special investigation” label on the box
- Take a photo of the label attached to the box and attach it to the case

Thanks,

customer has brought in their sorento with a fuel odor concern.

*** 03/12/2018 05:59:43 ***
Web - Diagnostics created on 03/12/2018 05:59:43 and created by Tim Tudhope
i have duplicated this concern. when starting you have a very extended crank like total loss in fuel pressure.there are no dtcs being set. fuel odor is coming from engine bay around intake area. there is no driveability concerns. vehicle seems to run just fine. also very strange when shutting off the vehicle you can hear the fuel pump still trying to prime the system. i have compaired to several others and this is the only one doing such. in tank pump is also making an abnormal hissing type noise. doesnt seem to have any type of leak in or around fuel tank. no puddles or fuel found anywhere out side the vehicle. i brushed over the previous tech line case for this vehicle and wonder if leaking injectors could be the root of all of these concerns. seems to be the only thing that makes sense for this concern. any advice or direction will be appreciated.

*** 03/12/2018 06:02:14 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 03/12/2018 06:09:44 and created by Steven Okimura ***
1: It sounds like the issue you are having after shut down may be the cause, possibly the injectors are also clicking after shut down, are they clicking? Inspect the PCM connectors for corrosion, inspect the engine harness for chafing. With the ignition off the main relay should open the fuel pump relay circuit, monitor voltage on the injector fuse when the ignition is shut off and the you can hear the pump trying to run.

*** 03/12/2018 06:55:27 ***
Web - Note created on 03/12/2018 06:55:27 and created by Tim Tudhope
dont hear any injector clicking after shut down. its more of a pressure building sound not so much the motorized pump running. no corrosion in pcm harness and dont see anything off the bat for the wire harness. all seems ok. with a probe on the

injector fuse i have power at the fuse for about a full 30 seconds after shutting off vehicle. would make sense of hearing the fuel pulled forward.

*** Web - Advice created on 03/12/2018 07:12:36 and created by Steven Okimura ***
1: Tim, will you compare the voltage on the Injector fuse with another like Sorento, I would think the power would shut down with the ignition off.
High fuel pressure typically rises after shut down, does the high fuel pressure drop or increase after shut down?

*** 03/12/2018 07:40:03 ***
Web - Note created on 03/12/2018 07:40:03 and created by Tim Tudhope
ok so compaired the fuse voltage to a couple other vehicles. about even with how long power stays on that fuse. so seems to be normal operation of fuse still having power. again no clicking from injectors during shut down. watching high pressure fuel rail it stay pretty much the same as it was when it was running. there was no pressure build. 510 at shut off and same after shut off. went to 515 but back down to 510 psi. doesnt seem to be operating correctly there

*** Web - Advice created on 03/12/2018 08:38:20 and created by Steven Okimura ***
1: Compare the pressure readings vs. another Sorento so we know what normal is, I see a high pressure pump and injectors were replaced, I'll review all the previous notes while you confirm what normal pressures are.

*** 03/12/2018 08:56:46 ***
Web - Note created on 03/12/2018 08:56:46 and created by Tim Tudhope
ok so compaired to another sorento and the one compaired to was idling about 900 psi. 400 more than the other. when shut down vehicle pressure built by about 30-40 psi. not a big jump but did go up. biggest thing i notice is the difference in fuel pressure at idle. im curious if something wasnt properly installed or has failed in the injector system. you get a fuel smell right up there by the intake too

*** Web - Advice created on 03/12/2018 09:25:24 and created by Steven Okimura ***
1: Tim, 900 psi sounds high for a warm engine at idle. Please add you cell phone number to the case notes.

1: Tim, Tried calling but did not answer, please call in when you have a moment.

*** Phone - Advice created on 03/13/2018 09:46:36 and created by Steven Okimura ***
1: Tim called in stating he only smells the odor when cold and when under the hood, unable to smell anything inside the vehicle. There is an extended crank also. Advised to check when the engine is cold for any signs of fuel leakage at the injectors/under the intake, typically it may only leak for a few seconds when cold, use leak check power if necessary.

*** 03/14/2018 11:22:02 ***
Web - Note created on 03/14/2018 11:22:02 and created by Tim Tudhope
ok so i have taken this down to the injectors. slightly more worried at this point. there is a pool of coolant in cyl. 1. no leaks coming from above. can see coolant washing in cyl 1 and there is corrosion around the aluminum head. coolant is getting fed into the intake some how. there is a fuel puddle right under neath cyl 2. cant really see from the pics but wantedt show area and the fuel rail with the orange tape of the end. cant get any type of pressure to see excatly where the leak is coming from. would need gdi start pressure to see where it is in fact coming from. i think we need to do at least a reseal of all injectors with the new gaskets or new injectors. dont show any signs of leaks from fuel rails. however concerned that could be a more severe issue with coolant reaching the cyl. it has been that way for a while showing the corrosion under that bolt hole only.

and coolant is coming from bolt hole as well like a leak inside the head. thats what i have so far. thank you

*** Web - Advice created on 03/14/2018 12:57:57 and created by Steven Okimura ***
1: Tim, one common problem with coolant leaks on the 3.3 are damaged head bolt threads in the block. If you try and tighten the head bolts they will just spin and not torque down.

*** 03/15/2018 08:33:11 ***
Web - Note created on 03/15/2018 08:33:10 and created by Tim Tudhope
tore down rear head and found a few of the bolts not reaching torque and just spinning. worse i found was at cyl 1. i have not tore apart the front head yet which i can do if we want to check that.

*** Web - Advice created on 03/15/2018 08:39:03 and created by Steven Okimura ***
1: Based on the information provided the short block should be replaced and the cylinder heads measured for flatness. If out of spec, Kia does not recommend resurfacing and replacement is necessary.

*** 03/29/2018 05:41:03 ***
Web - Note created on 03/29/2018 05:41:03 and created by Tim Tudhope
ordered short block will fallow all replacement procedures. will reopen case if further assistance is needed.

*** 03/29/2018 05:42:23 ***
Case Closed with Resolution Code: Information Given

1: Hello Paul
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

Customer reports vehicle does not blow heat. Cooling system has failed pressure check.

*** 03/22/2018 13:21:55 ***
Web - Diagnostics created on 03/22/2018 13:21:55 and created by Kerry Mudrak
Coolant level was low. Cooling system failed pressure test. After pressure test, upon starting motor, heavy cloud of white sweet smelling smoke came from tailpipe. Performed
cylinder leakage test to find Cyl#1 had leakage through cooling system. Opened techline assistance case. torqued head bolts as instructed to 80 ft lb. Three of Bank #1 head bolts
pulled threads from block. Removed cylinder heads, checked for true. Heads warped at o beyond specification. Many photos attached to assistance case. Please advise.

*** Web - Advice created on 03/26/2018 14:03:48 and created by Chris Schang ***
1: Murray,
We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped near the affected leakage on the head gasket. Please also check for metal in the OCV's. If either of these two items has failed inspection, please let me know before continuing. Thanks

*** 03/29/2018 10:17:00 ***

Customer is complaining that car gets hot every now and then. wont always happen. It also has a really rough idle at start up

*** 04/02/2018 05:55:21 ***
Web - Diagnostics created on 04/02/2018 05:55:21 and created by Tristan Tornblom
Looked car over, found no external coolant leaks. Pressure checked system. help 16 psi. It was low on coolant so started the car up with a bucket to burp the system, and while the car was running there was constant bubbles and oil clots coming up

*** 04/02/2018 05:58:44 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 04/02/2018 05:59:44 and created by Steven Okimura ***
1: Perform a cylinder leakdown test to determine which cylinder is leaking.
Remove the valve cover and take a few photos of the valve train (not the valve cover) to determine if the engine was maintained properly, attach the photos to the case. If okay, try torqueing down the head bolts, we have seen damaged threads in the block, if the head bolts do not torque down the threads are damaged.

*** 04/02/2018 10:15:22 ***

*** Web - Advice created on 04/09/2018 10:11:20 and created by Sam Camarillo ***
1: • Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.
2: If customer has valid warranty coverage you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it.

1: Make sure the engine is not overheating, perform block test

*** 04/07/2018 10:15:37 ***
Web - Note created on 04/07/2018 10:15:37 and created by Michael Rosbury
not over heating and block test was negative

*** Web - Advice created on 04/07/2018 12:27:15 and created by Jameson Phillips ***
1: Tech called in to discuss the case. Tech advised that he has driven the vehicle and it doesn't appear to be overheating, but bubbles are still constantly showing in the reservoir with the engine running. Tech advised that if he revs the engine, the bubbles increase. Advised tech to check the radiator cap to make sure it is holding proper pressure. Then, advised tech to check the block test fluid he is using by placing the test bulb near the tailpipe, and drawing a sample in to see if he gets an

immediate change in color. Tech advised he pumped the bulb about 40 times before there was any change. Advised to replace the block test fluid, with good fluid. This fluid should change very fast if drawing a sample directly from the tailpipe. Tech advised that he would obtain fresh fluid, and redo block test, and test the cap, as well as perform a leakdown test on all 6 cylinders to see if he gets bubbles in the cooling system during leakdown.

*** 04/09/2018 12:08:40 ***
Web - Note created on 04/09/2018 12:08:40 and created by Michael Rosbury
performed leakdown test and had no leakdown from any cylinders. no new block test fluid yet

*** Web - Advice created on 04/09/2018 12:49:14 and created by Mike Ozonur ***
1: Please update the case once you perform the block test with new fluid.

*** 04/13/2018 11:22:14 ***
Web - Note created on 04/13/2018 11:22:14 and created by Michael Rosbury
got new fluid and vehicle failed block test but every cylinder passes the leakdown test

*** Web - Advice created on 04/13/2018 12:27:10 and created by Mike Ozonur ***
1: Can you please provide a video of the block test, also when you states that every cylinder passes the leak down test what are the results.
Also is there any bubbles in the cooling system if you pressurize the cylinders, or when you are performing the leak down test.
lastly remove the valve covers and try to torque the cylinder head bolts to 85ftlbs see if they tighten or if they are loose.

1: Thank you for the photos of the head gaskets leaking.

When the front valve cover is off please attach a photos of the valvetrain for the maintenance inspection.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Thanks

*** 04/25/2018 07:19:17 ***
Web - Note created on 04/25/2018 07:19:17 and created by GREG NICHOLS
Okay , I've pulled the came put a torqued the bolts they got to about 35 ft lbs cracked loose and just turned I pulled a few of them out and the block and the treads of the block came out with them. Sending pictures.

1: Thank you, I can see the threads on the head bolt have been compromised. The block will need replacement.

Please remove the cylinder heads and measure the flatness and let me know if the cylinder heads need replaced as well. Then I can open the PWA case for you and get you the approval to replace the necessary components, Thanks Greg
I have reviewed the pictures of the valve train. The condition of the engine shown in the pictures you attached to the case appears the engine has been maintained correctly.

2: Be sure to attach the completed and signed WRTY143 [Rev. 11/1/2016] core data form to this case. The form must be filled out (all available sections) and signed and dated by the Service Manager and The Technician.

*** 04/25/2018 09:00:46 ***

1: Please remove the valve cover and take a few photos of the valve train (not the valve cover) to determine if the engine was maintained properly, attach the photos to the case.
The head will have to be removed and check the block and head for flatness. Before removing the head bolts, try torqueing them to specs, if they will not tighten the block threads are likely damaged.

Customer states vehicle overheating, temp gauge not reading hot, cooling fan continues to run after shutting vehicle off.

*** 05/02/2018 06:23:37 ***
Web - Diagnostics created on 05/02/2018 06:21:13 and created by Christopher McKenney
Checked vehicle, verified complaint, checked for DTCs, none found, checked coolant level, found overflow reservoir empty, and radiator almost completely empty, refilled cooling system and pressurized system to check for leaks. Found coolant leaking between bank 1 cylinder head and engine block in the area of cylinders 3 and 5, noticeable residue down engine block and transfer case from coolant leaking. There does not seem to be any compression loss in these cylinders, as there are no misfire DTCs or rough idle. Will provide pictures of coolant leak if needed. Would you suspect this just a head gasket issue? Are there any known issues with these engines of having the head bolts shear off the threads within the cylinder block, creating the head gasket failure?

1: Chris,
Tech line now has the ability to generate a PWA case from the Tech line case. The previous Tech line Agent requested for you to fill out and attach the PWA WRTY 143 form to the repair assistance case as he was going to generate a PWA from the Tech line case. So you need to refer back to the original case # 12710250 and follow up the Agent request.
NOTE, I am going to close this case and deny the claim.

Thank you

Web - Problem Description created on 05/09/2018 13:54:05 and created by Aaron Srebro
vehicle came in for coolant loss. verified level was almost empty in reservoir. filled system and let vehicle run for approx. 20min to help find severity of leak. While performing coolant pressure test, also visually inspected engine/ cooling system for leaks--found NONE. After 2nd inspection of cooling system reservoir--found OIL contamination in reservoir/cooling system!! suspect failed headgasket(s) for cross contamination. Recommending REPLACE longblock, ALL rubber cooling system hoses, as well as flushing heater core and flushing radiator prior to new engine installation. Also, 1 follow-up coolant flush POST engine/coolant hose replacement to remove any possible additional contamination left in cooling system. Will submit photo of contaminated coolant.

1: Thank you for the block check process.
Thank you for the information. The mileage and the yr of the vehicle show that this may be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.
A: Please make sure the vehicle is in warranty for Powertrain Repairs. Please click on the validate warranty coverage box in this case. Check with your Service Writer or Manger to verify and validate the coverage.

B: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

C: We will need to measure the cylinder heads for warpage and see if they are within specks.

1: Hello kevin
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not

then the block will need to be replaced, Please report your findings

*** 05/16/2018 07:19:55 ***

Web - Problem Description created on 05/18/2018 09:12:19 and created by Jacob Kuda
Suspected blown head gasket or crack in engine.
Customer states the engine would overheat at stops, coolant in radiator dropped to very low level but coolant reservoir was overfull; and after filling and sitting overnight the engine had a rough startup.
When vehicle arrived coolant was low in radiator again and reservoir overfull. When I filled the radiator with a funnel I could lock down I noticed a constant stream of small bubbles that would only show up once the engine was warm and running. Bubbles would stop instantly when shut off.
I topped off the radiator, dropped the reservoir to normal and test drove the vehicle, did not get hot (at least not this time) but after driving in city traffic the reservoir was again overfull and was continuing to fill with a constant stream of bubbles (that stopped when engine stopped) the coolant hoses are pressurized but filled with gas.
No external leaks

*** 05/18/2018 09:12:40 ***
Web - Diagnostics created on 05/18/2018 09:12:19 and created by Jacob Kuda
Visual inspection of cooling systems including fan operation - normal
Topped off cooling system and allowed to bleed
Test drove vehicle
Performed block test (combustion leak test fluid) - oddly came negative despite large amounts of pressurized gas in cooling system after running.

*** 05/18/2018 09:15:41 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 05/18/2018 09:17:06 and created by Frank Lusic ***
1: Hello Jacon
is the cooling fan operating ?

2: Please perform the Block Test inspection, please use this method, with the vehicle fully warmed up, test drive the vehicle again and perform a couple hard accelerations and then when the vehicle is back in the service bay remove the cap from the coolant recovery tank and immediately test the air inside the recover tank, Please report your findings

*** 05/18/2018 10:06:38 ***
Web - Note created on 05/18/2018 10:06:38 and created by Jacob Kuda
The cooling fan is operating, cycling on and off. And constant on if aircon is turned on
I re-preformed the block test after the test drive and did manage to get the liquid to partially change color (tank was bubbling again with the cooling system re-pressurized with gas as before)

*** Web - Advice created on 05/18/2018 10:39:11 and created by Frank Lusic ***
1: Please remove the cylinder head and inspect for a warped block and or head by using a precision straight edge , also check for cylinder wall damage, stripped threads in the block for the head bolts, please take and attach any pictures of any damage if found and attach it to the case, and if the head or block is warped let me know by how much thank you

*** 05/23/2018 09:43:23 ***
Web - Note created on 05/23/2018 09:43:23 and created by Jacob Kuda
I have torn the engine down. the head gasket has blown at cylinder 1 (pictures of gaskets and head surfaces attached).
The headbolts on the exhaust side of cylinder 1 were much looser than the rest of the headbolts, tightness seemed to vary some between all bolts (but may not mean much)
Attempting to thread in bolts by hand on bolts that were loose is not possible, bolts turn a few turns and then get stiff, there was a few couple threads that did pull out during this time but looking down bolt holes I think the threads cleaned with a thread chaser. Unless you have other recommendations
No measurable warpage (my gauges go to 0.0015in/.04mm) on heads or block surfaces.
Also attached is a picture of a valve lifter bucket for #6 which has an odd pattern worn into the surface along with some on the cam lobe.
No abnormal damage to cylinder bores or mating surfaces

Web - Diagnostics created on 05/31/2018 11:18:25 and created by Siebel eSupport
Verified concern, found coolant low. Refilled and started vehicle. Air coming out of radiator. Reference techline case number 12735196. Performed a leak down test and air bubbling out of radiator when cylinder 5 was pressurized. Pressurized cooling system and using a boroscope coolant found dripping in to cylinder. Found head bolts coloset to exhaust manifold loose. Removed bank 2 cylinder head and head gasket was blown. No threads seen on head bolts. Head and block deck surfaces are not warped. Attempted a head gasket repair by replacing bank 2 head gasket and head bolts. Installed head and bolts were able to torque to 30ft. At next step to torque bolts, head bolts kept spinning. Removed bolt and aluminum found on bolts. Threads came out of short block. Short block requires replacement. Pictures are attached

Customer states vehicle seams to be reading a little hotter than normal. Check and advise.

*** 05/24/2018 07:46:38 ***
Web - Diagnostics created on 05/24/2018 07:34:36 and created by David Pascale
Inspected vehicle. Checked coolant level, air pressure escaped when the cap was removed. Refilled coolant and started vehicle. Coolant coming out of radiator aggressively. Air is entering system. No DTCs for misfires, P0660 stored but not related to a cooling system issue. Removed bank 2 spark plugs and performed leak down. No air coming out of radiator. Removed intake plenum to access bank 1 spark plugs. Performed leak down test. Cylinder number 5 has air escaping out of radiator. Air is escaping aggressively. Using a boroscope, viewed cylinder 5 and pressurized cooling system. Coolant is seen dripping down cylinder walls. Suspect blown head gasket and or warped deck surfaces. Will removal of cylinder head be required or submit for a PWA long engine replacement. Note: Cylinder 5 picture, the leakdown gauges are not accurate for leak down proof. Air pressure was reduced to take a photo due to coolant spraying out of funnel.

*** 05/24/2018 07:47:18 ***

Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 05/24/2018 07:50:14 and created by Tony Thomas ***
1: Get approval to pull the head for further inspection. Prior to removing the head, torque check the head bolts to see if they are all holding. If any are loose and pulling the threads from the block, this will need an engine.

*** 05/24/2018 08:25:24 ***

Web - Note created on 05/24/2018 08:25:24 and created by David Pascale
I was able to lift cams high enough to access head bolts near cylinder 5. At cylinder 3, the head bolts between cylinder 1 and 5 were not torqued compared to other head bolts. Using my digital torque wrench, at roughly 25-30ft lbs, the bolts popped and began to turn. I compared to other head bolts and my torque readings were exceeding 45-50ft lbs. Head bolt between cylinder five and three exhaust valves is the area were I saw the coolant seeping into cylinder 5.

*** Web - Advice created on 05/24/2018 08:27:52 and created by Tony Thomas ***
1: Were they only loose (not properly torqued) or did they pull the threads out?

*** 05/24/2018 08:56:03 ***
Web - Note created on 05/24/2018 08:56:03 and created by David Pascale
I only checked and compared torque to other head bolts first. I removed all head bolts on the exhaust side of the head. The front bolt between cylinder one exhaust valves and vvt was the only bolt tight in that row. No threads from block seen. The loose bolts are covered in oil and the galleys have oil in them. I removed two torqued head bolts from the intake side of head and they are dry. I measured the length of the head bolts, loose to torqued ones and the overall length is 146.6mm +/- .3mm.

*** Web - Advice created on 06/07/2018 10:00:12 and created by Eric Patterson ***
1: Thank you. Please attach a picture to the case of the affected head bolts if they are stripped..

A: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.

B: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
C: We will need to measure the cylinder heads for warpage and see if they are within specs.

2: Please next time open a repair assistance case for this concern as we can now open the PWA case for the approval for you, PWA cases need closed within 5 days of opening. Thanks.

1: Hello Brendon
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on both banks, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

1: It will need the engine for the stripped head bolt threads. But we need to verify proper maintenance first. Please remove the valve cover and attach one or two clear, well lit photos of the valve train to the case. IF you find sludge in the engine, then you will need to get the customer's service records. Attach at least one clear photo of any metal debris or damage that you find. If you have verified there has been no abuse or external impact, the engine is not used or from a junk yard, and the warranty is valid according to WEB DCS, you will also need to review warranty bulletin 2015-09 and attach the completed and signed WRTY 143 core data sheet to this case.

Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 06/23/2018 10:48:43 and created by Brian Lall ***
1: Kristian, was a short block or long block replaced, and were any other components replaced with the engine? I checked the E-report and found a lot of other DTCs you did not mention and some show to be active. Is that a result of your testing?

*** 06/23/2018 13:49:47 ***
Web - Note created on 06/23/2018 13:49:47 and created by KRISTIAN MANZO
it was a long block since the head bolts would just spin in place they wouldnt come out. the other dtc was the barometric pressure? it was unplugged

*** Web - Advice created on 06/23/2018 13:56:14 and created by Brian Lall ***
1: Please graph the CMP and CKP signals with the engine running using the VMI and attach the graph to the case. Thanks.

the cam position sensor*

*** Web - Advice created on 06/26/2018 07:56:40 and created by Brian Lall ***
1: With the KOEO and the CMP connector unplugged note the voltage on all 3 terminals. Then with the Ignition off unplug the C500-B connector from the PCM and check the resistance to ground on pin 1 of the CMP sensor connector with it unplugged as well. Thanks.
2: Please remove the cam sensor and have someone crank the engine and watch the tone wheel and make sure it is turning as designed.

*** 06/26/2018 13:51:30 ***
Web - Note created on 06/26/2018 13:51:30 and created by KRISTIAN MANZO
update on this vehicle found signal whire to have been backed out of pin. replaced connection with pigtail and vehicle is operating as design thanks.

*** Web - Advice created on 06/27/2018 04:51:36 and created by Brian Lall ***
1: Good job! Since the vehicle is now working as designed, I am closing the case. Thanks.

VEHICLE OVER HEATED

*** 06/27/2018 08:06:05 ***
Web - Diagnostics created on 06/27/2018 08:06:05 and created by Stetson Watts
VEHICLE CAME IN OVER HEATED. ADDED COOLANT DIE TO THE COOLING SYSTEM AND PRESSURE TESTED SYSTEM. FOUND COOLANT TO BE LEAKING OUT OF LEFT FRONT HEAD AND BLOCK MATING SURFACE. REMOVED ENGINE AND BOTH HEADS. WHILE REMOVING HEAD BOLTS FOUND FRONT CORNER HEAD BOLT TO HAVE PULLED THREADS OUT OF BLOCK. CONTACTED MACHINE SHOP CAME OUT AND LOOKED AT BLOCK AND ADVISED THAT THERE IS NOT ENOUGH ROOM TO RE TAP BLOCK BOLT HOLE.

1: Thanks for letting me know what you found. Based on the information you provided, my recommendation is to replace the engine on this vehicle as outlined in the shop manual. I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines. Techline can now create a PWA case automatically from the repair assistance case once all information is provided, so you do not need to do it. Please attach the WRTY 143 PWA form to this case. Thanks.

*** Phone - Advice created on 06/27/2018 08:15:01 and created by Brian Lall ***
1: Stetson called and I advised of the previous notes. He is going to attach the PWA form but wanted to know if we are going to replace the long block or short block. I advised the long block is preferred but it depends on parts availability.

PWA Case 12790531 created by Greg Phillips

*** Web - Advice created on 07/13/2018 14:26:40 and created by Greg Phillips ***
1: Spoke with Tech. I have generated a PWA case, 12790531, for you. Please validate the vehicle warranty, in the new PWA case, so the PWA can be approved. Then please close this case and fill out the survey.

Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

Head gasket is leaking coolant

*** 07/03/2018 10:10:12 ***
Web - Diagnostics created on 07/03/2018 10:10:12 and created by Bob Dempsey
Removed heads to replace head gaskets.
While torqueing head gasket the threads in the cylinder block pulled out of the block. I presume this is why the gasket failed to begin with.
The threads pulled out on the initial pass of the torque sequence.
I presume we will need to replace the short block.

1: Bob, thanks for letting me know what you found. If you can see any damage such as threads that came out of the block on the head bolts take pictures of it and attach them to the case for documentation. Please also attach the WRTY 143 form to the case and make sure it is filled out as per PS 561. Thanks.

PWA Case created for RA Case 12778595 by Brian Lall

*** Web - Advice created on 07/03/2018 13:06:07 and created by Brian Lall ***
1: I have created this PWA case, you will need to respond to the notification e-mail that you got when it was created. You will need to determine if the warranty is valid. Once you do that the case will be closed and approved if it is valid, if you cannot validate the warranty the case will be closed and denied. Thanks.

*** 07/05/2018 04:27:50 ***
You have validated the warranty and the completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures.Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

*** 07/03/2018 08:24:26 ***
Web - Diagnostics created on 07/03/2018 08:23:15 and created by Michael Lamb
This vehicle has been techlined before. Discovered the head gaskets blown. Got approval to replace the head gaskets. Removed heads and sent them to a machine shop for them to be checked out. Received the heads back and started the process of putting the engine back together. Put down the RTV, put the head gasket down and placed the head on the block. Put the new bolts in and hand tightened them down to where I would start the torquing process. It occured to me I didn't place the RTV on the top of the head gasket before placing the head on. Removing the bolts, that were never torqued down, thread came out with three of the bolts. When I removed the heads, I noticed that the center bolts were loose, the bolts closest to the timing cover were tight, and the bolts closest to the trans were semi tight.

*** 07/03/2018 08:25:40 ***

I also look over any outside leaks and no leaks found

*** Web - Advice created on 07/09/2018 13:05:21 and created by Eric Patterson ***
1: Thank you for the additional information.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
3: Then We will need to measure the cylinder heads for warpage and see if they are within specs.

*** Web - Advice created on 07/09/2018 13:06:38 and created by Eric Patterson ***
1: . We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

*** 07/11/2018 09:19:40 ***
Web - Note created on 07/11/2018 09:19:40 and created by Patrick Keller
TECH R&R ENGINE NO METAL IN OCV'S AND WHEN TECH WENT TO CHECK TORGUE ON HEAD BOLTS HE FOUND THE 4 HEAD BOLTS ON THAT CYL WONT TIGHTEN DOWN. STRIPPED. NOW WHAT DO YOU WANT ME TO CHECK OR DO?

*** Web - Advice created on 07/11/2018 09:24:52 and created by Eric Patterson ***
1: We will need to measure the cylinder heads for warpage and see if they are within specs.
2: The engine will need replaced. If the heads are warped they will need replaced. If they are within specs after the inspection with the strait edge please replaced the block with a reman block and send the heads out for inspection. Or if there is a long block available please use the long block reman engine.
3: Please let me know the results of the heads and please attach pictures of the stripped head bolts and the WRTY 143 form to the case.Once the PWA form is added I WILL CREATE THE PWA CASE AND APPROVE IT FOR YOU. . Please do not open a PWA case on your own…

*** 07/11/2018 11:02:24 ***
Web - Note created on 07/11/2018 11:02:24 and created by Patrick Keller
I did straight edge check of the cly head and the cylinder was at .002 and with .0025 it won't fit and .005 still no fit. So if I'm right the cyl head should be ok. Will just need check at machine shop. Correct and sent pic of head bolt and form

1: Please perform a cooling system pressure test and note if the pressure drops and if there are any external leaks. Please also remove the oil filter and look for signs of coolant in the oil filter housing. Please check the transmission fluid level and condition and note what you find in the case. Thanks.

*** 08/04/2018 12:24:01 ***
Web - Note created on 08/04/2018 12:24:00 and created by Edward Jimenez
Removed oil filter and found clean, no smell of coolant
Pressure tested vehicle and found no problem with cooling system dropped 1 psi in 5 minutes, no signs of coolant leaking or oil
Checked trans found oil at proper level, fluid looked like darkish red/brown type of color not milky

*** Web - Advice created on 08/04/2018 13:07:10 and created by Brian Lall ***
1: There is no oil cooler or any common places the oil could get into the coolant. Did the customer state they added oil at any point. Could the oil have been added to the cooling system in error?

*** 08/06/2018 07:16:56 ***
Web - Note created on 08/06/2018 07:16:56 and created by Edward Jimenez
Customer didn't complain of anything but an oil leak

*** Web - Advice created on 08/06/2018 08:26:14 and created by Brian Lall ***
1: Is the oil level low or full? Please try to find out if the customer added oil, if they saw oil leaking or dripping onto the ground under the vehicle, or why they stated there was an oil leak.

*** 08/06/2018 08:43:06 ***
Web - Note created on 08/06/2018 08:43:06 and created by Edward Jimenez
Customer stated there was an oil spot on their driveway, vehicle in for oil leaks previous visit no l leak was found. Now they came in for oil leaking into reservoir.
Oil level is full there was an oil change done on it at previous visit

*** Web - Advice created on 08/06/2018 09:45:27 and created by Brian Lall ***
1: Please try to get all the oil out of the cooling system by draining it or sucking the fluid out of the reservoir and then performing a flush or if needed by running a detergent such as shout or a small amount of dishwashing liquid in the cooling system to break down the oil, then flushing it, then drive the vehicle to see if you can verify the oil going into the cooling system or any oil consumption. Please contact your DPSM for authorization.

*** Web - Advice created on 11/07/2018 09:24:49 and created by Tony Thomas ***
1: If they do not hold torque or pull the threads from the block, it will need an engine. In the event the engine is neglected, the customer must authorize dealer to perform any engine tear down or required mechanical inspections if they wish to disprove neglect as the cause of the concern. Should this diagnosis find no manufacturer defects, the customer would be responsible for tear down fees and any subsequent repairs.

*** 11/07/2018 10:16:50 ***

*** Web - Advice created on 08/08/2018 09:58:42 and created by Brian Lall ***
1: Please check the engine and transmission oil levels and note if one is high or low. Please also make sure this is the original Kia radiator and it is not damaged at all. Then remove the oil filter and pressurize the cooling system and check for any signs of coolant going into the filter housing. Let me know what you find. Thanks.

*** 08/08/2018 12:29:23 ***
Web - Note created on 08/08/2018 12:29:23 and created by RICHARD MIDDENDORF JR
Trans looks good, engine oil now is about 1 qt low, radiator looks like original but is showing signs of oil where tanks are crimped into core, pressuring cooling system it seems to be holding about 20 psi and do not see any thing in the oil filter housing and no signs of coolant in the oil at this time. May not have enough pressure in cooling system to make leak happen at only 20 psi with engine running oil pressure is likely close to 100 psi

*** Web - Advice created on 08/09/2018 05:46:17 and created by Brian Lall ***
1: I agree with you about the cooling system not having enough pressure to cause the leak, the oil mixing with the coolant is not common on this engine but I think the most likely cause is through the oil filter housing (I think it has coolant flow through it). If there are coolant hoses to the filter housing note if the coolant hoses to it show signs of oil in them. Thanks.

*** 08/09/2018 10:25:43 ***
Web - Note created on 08/09/2018 10:25:42 and created by RICHARD MIDDENDORF JR
Looking at this motor i am 99 % sure that it does not have coolant flowing though the oil filter housing. Some of the early Lambda V6 motors did have an oil cooler under the intake but this one does not.

*** Web - Advice created on 08/09/2018 10:51:51 and created by Brian Lall ***
1: If there is no oil to coolant heat exchanger on this engine then my recommendation is to contact your DPSM for authorization to remove the heads and to inspect for damage to the head gaskets, signs of cracks in the block or heads, and for warping. Let me know what you find. Thanks.

*** 08/16/2018 08:59:01 ***
Web - Note created on 08/16/2018 08:59:01 and created by RICHARD MIDDENDORF JR
Got heads off, found 8 out of 10 head bolts on both sides with treads pulled out of block, only ones that were tight were 4 closest to bell housing. Head gaskets looked good but with an MLS gasket they do not show sings of leaking sometimes like an old style gasket will Check both heads for warpage found right head about .002 in and left side a .002 in gage is loose so that side is about .0025. It does not like kia has a long block so what do we want to do with it assume that the oil leak into the cooling system was at the head gasket, do we try and reuse the heads or replace them along with the block?

*** 08/16/2018 09:43:34 ***
Web - Note created on 08/16/2018 09:43:34 and created by RICHARD MIDDENDORF JR
I can't count make that 6 out of 8 bolts on each side.

*** Web - Advice created on 08/16/2018 10:05:04 and created by Brian Lall ***
1: Based on the information you provided, my recommendation is to replace the engine on this vehicle as outlined in the shop manual. I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines. You are at a self-authorizing dealer so no PWA case is required; just verify the warranty is valid. If for some reason you are being required to open a PWA case please attach the completed WRTY143 PWA form to this case and let me know, then I will create the PWA case for you so do not need to. Thanks.
2: The spec for flatness of the gasket surface is Flatness of gasket surface

Less than 0.05mm (0.0019in.)
[Less than 0.02mm (0.0008in.) / 150x150] so the heads are out of spec and should be replaced. Thanks.

*** 08/16/2018 10:37:15 ***

1: Thanks for the picture of the damage.

*** 08/16/2018 12:40:10 ***
Web - Note created on 08/16/2018 12:40:09 and created by RICHARD MIDDENDORF JR
We are going to have to replace all the coolant hose, cooling system seals, radiator, since they are damaged by the oil, but what do you thing about the heater core i flushed it out with water for about 15 min but i do not know if there are any rubber seals in it that the oil may have damaged.

*** Web - Advice created on 08/16/2018 13:42:54 and created by Brian Lall ***
1: I do not think there should be any seals that can become damaged in the heater core so if you were able to completely flush it and clean the oil out then it can be reused. Thanks.

I have added photos to the case

*** Web - Advice created on 08/20/2018 14:52:59 and created by Eric Patterson ***
1: Thank you Upon removal of the manifold you will need to perform a coolant pressure check . Please check what stud hole the coolant is coming from. Please add a picture, the cylinder head will need replaced.

Upon removal of the cylinder head, please perform the inspection below.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

If the part and labor will be over $1000.00, please obtain approval from your DPSM for replacement .
3: If the part and labor will be over $1000.00, please obtain approval from your DPSM for replacement

bolts tightened to 80 ft lbs

*** Web - Advice created on 09/10/2018 15:28:30 and created by Eric Patterson ***
1: Thank you, please measure the heads and the block for warpage and let me know the results.

*** 09/12/2018 11:37:27 ***
Web - Note created on 09/12/2018 11:37:27 and created by Andrew Johnston
I removed the cylinder head and checked flatness both block and head were less then .05 mm also went one lower .038 and did not pass under the straight edge.

*** 09/12/2018 11:57:05 ***
Web - Note created on 09/12/2018 11:57:04 and created by Andrew Johnston
When replacing the cylinder head assy. should new valves be ordered as well?

*** Web - Advice created on 09/12/2018 13:10:41 and created by Eric Patterson ***
1: No the valves should be reused unless there are issues with clearance. I would send the valves and both the heads to a machine shop for transfer of all good components.

*** 09/19/2018 13:10:33 ***

Customers concern , pouring oil very badly , towed in ... Found head gasket leaking

*** 08/29/2018 10:03:16 ***
Web - Diagnostics created on 08/29/2018 10:03:16 and created by Jay Hammond
Confirm customers complaint leaking or pouring oil from transmission ... After digging into it a lot further found the right front head gasket was leaking oil into the valley and dumping it out through the drain port , found coolant in the oil .. confirm it needed the head gasket .. During the repair to replace the head gasket itself found that two of the head bolts will not come out , one is just spinning and not coming up the other cam up about 1/4 of an inch and now is just spinning .. Need long block at this point unable to remove with out damaging motor ..

PWA Case 12898110 created by Tony Thomas

*** Web - Advice created on 10/09/2018 12:11:36 and created by Tony Thomas ***
1: Based on the information provided, I recommend that you replace the engine following normal service procedures. Replace the engine with a long block, if available. If a long block is not available replace the short block and follow TSB ENG190 best practices for engine component re-use guidelines to build a long block. I have generated a PWA case for you. Please validate the vehicle warranty and the PWA will be auto approved. If you do not validate the warranty, you do not have approval to replace the engine. Please close the case when the repairs are completed or if no further assistance is required. Thank you.

*** Web - Advice created on 09/12/2018 15:42:32 and created by Eric Patterson ***
1: Thank you for the updated information. If the block check has failed, We will need to remove the cylinder heads and inspect for warpage.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
3: This will ensure the bolts have not come loose at the block threads causing the head gasket failure. Please let me know if the bolts all hold the 80ft lbs with the torque wrench test

"Yesterday while driving, the AC quit working and then the vehicle overheated. Customer had vehicle towed in."

*** 09/14/2018 09:23:19 ***
Web - Diagnostics created on 09/14/2018 09:23:19 and created by Kevin Preiser
Cooling system was nearly empty. Refilled cooling system and test drove vehicle. After test drive, noticed vehicle is constantly bubbling in coolant reservoir. Used head gasket checker (uses the blue fluid) at radiator cap and fluid changed color indicating exhaust gas. Vehicle appears to have blown headgasket/damaged head ,etc. There is coolant present on back side of engine near coolant bridge, but unable to verify leak location yet. Appears front head may be leaking oil as well.

Web - Note created on 09/14/2018 10:34:20 and created by Kevin Preiser
The head bolts can't be accessed without removing the cams, and due to time, I won't be able to go that far with it today. However, I did pull the front valve cover and it appears that coolant is mixing with engine oil. I submitted a photo of the valve cover and also attached a photo of the rear corner of the front cylinder head which shows coolant and oil leaking.

*** Web - Advice created on 09/14/2018 10:41:17 and created by Jerry Gossling ***
1: Kevin,
Thank you for the update. Let me know when the head bolts have been check as I completely understand not having the time today.
Thank you

*** 09/17/2018 07:48:52 ***
Web - Note created on 09/17/2018 07:48:52 and created by Kevin Preiser
Removed timing chains and cams this morning and checked to see if all head bolts would hold 60 ft/lbs. 5 bolts on the front head do not hold, and the one in that rear corner of the photo was darn near loose. 1 bolt on the rear head did not hold 60 ft/lbs.

*** 09/17/2018 07:49:13 ***

Attached photos of front cylinder head valve train and WRTY143. Vehicle had powertrain warranty per Web DCS. No external damage noted.

*** Web - Advice created on 09/18/2018 10:38:26 and created by Jerry Gossling ***
1: Kevin,
Thank you for the pictures and the information. Based off of your information the engine will need to be replaced. Please review Pitstop 539.

I noticed your dealer is DSA (Dealer Self Authorizing) This means the only person who needs to authorize this repair is your service manager.
NOTE, you don't need a PWA case so please don't open one.

Thank you

1: Hello Paul
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** 09/18/2018 10:29:34 ***

Web - Problem Description created on 09/24/2018 13:06:06 and created by Eric Sandler
CUSTOMER BROUGHT THEIR CAR IN STATING THE ENGINE IS OVERHEATING. WHEN STARTING THE ENGINE COOLANT COME OUT THE RADIATOR

*** 09/24/2018 13:06:06 ***
Web - Diagnostics created on 09/24/2018 13:06:06 and created by Eric Sandler
.RADIATOR AND THE THERMOSTAT WERE REPLACED. RADIATOR WAS LEAKING. PERFORMED BLOCK TEST. BLOCK TEST WAS INCONCLUSIVE. REMOVED UPPER INTAKE AND ALL SPARK PLUGS. LOOKED IN ALL THE CYLINDERS WITH A CAMERA. CYLINDERS 2 AND 5 THE TOP OF THE PISTON LOOKS CLEANER THEN THE OTHER PISTONS. NO EXTERNAL LEAKS ON THE ENGINE. PRESSURE TEST SHOWED NO INTERNAL CYLINDER LEAKS.

Accepted, from Queue = TL_Sorento_Sportage to WIPBin Default

*** Phone - Advice created on 09/24/2018 14:04:37 and created by Eric Patterson ***
1: Thank you for calling in on the case, Please try and torque down the cylinder head bolts to 80 ft lbs and see if the bolts will hold, If not we will use the PWA case you have already opened for the block replacement. Please also measure the heads for warpage once removed so we know if the heads will need replaced.
2: Once we figure out if the bolts will hold, we can approve the case for the block replacement as the vehicle does have warranty as the original owner. Thanks Eric...

*** Service Alert Escalated to CA as: 12881413 on 09/25/2018 01:06:20 (PST)

*** 10/03/2018 05:05:54 ***
Web - Note created on 10/03/2018 05:05:54 and created by Eric Sandler
SORRY FOR THE DELAY. BEEN A LITTLE BUSY. REMOVED THE CAMS AND CHECKED THE TORQUE ON THE HEAD BOLTS. FOUND 2 HEAD BOLTS ON THE FRONT BANK THAT TURNED WHEN CHECKING THE TORQUE. THEY ARE THE 2 LOWER BOLTS NEAR THE FRONT OF THE ENGINE ON THE RIGHT SIDE OF THE CAR. THE HEAD BOLTS ON THE REAR BANK ARE OK.

*** Phone - Advice created on 10/03/2018 06:29:13 and created by Tony Thomas ***
1: Eric called in reporting the head bolts not torqueing. Advised to attach a photo of the full valve train, the head bolts with the threads pulled from the block and the WRTY143 engine core data form to the PWA case for warranty approval. Thank you.

Vehicle was overheating and has coolant leak.

*** 09/26/2018 13:51:53 ***
Web - Diagnostics created on 09/26/2018 13:51:53 and created by Chad Davis
Found head gasket leaking at bottom of cylinder head. Removed head to replace gasket and found one of the head bolts stripped the block out (all the threads from the block still on threads of bolt). I will not be able to torque the bolt, down properly so it will need an engine. See attached picture of bolt.

1: Thank you for the attachments to the case.

Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
3: We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

*** 10/02/2018 15:25:15 ***
Web - Note created on 10/02/2018 15:25:15 and created by shane allen
no metal in the ocv, found all the head bolt on the exh side of the head to be loose and the 2 bolts nearest to the leak to be stripped out. uploaded picture of the bolt.

Do we know what caused the head bolt to strip out? The claim is going to KIA CPO and they need a failure.
Thanks.

*** Web - Advice created on 10/10/2018 05:53:31 and created by Sam Camarillo ***
1: Overheating lifts the head and causes the bolt to pull.

*** 10/10/2018 06:25:58 ***
Web - Note created on 10/10/2018 06:25:58 and created by jeremy nelson
Do we know what caused the vehicle to overheat and create this concern?

*** Web - Advice created on 10/10/2018 06:32:08 and created by Sam Camarillo ***
1: At this point it would be hard to tell without thorough inspection. T-stat, low coolant level, leaky hose, faulty coolant fan etc. are all items that would need to be inspected to find a root cause.

*** 10/10/2018 07:16:04 ***
Web - Note created on 10/10/2018 07:16:04 and created by jeremy nelson
What about the threads pulling from the block? This would be the 5th car we have seen where the threads pulled from the engine block and after repair of the engine there are no external leaks and the cooling system operates as designed.

*** Web - Advice created on 10/10/2018 08:08:42 and created by Sam Camarillo ***
1: Apparently the head bolts pull easier than other engines when overheated, we have thousands of these engines in service. If the problem was seriously widespread we would be seeing a TSB or SA come out.

*** 10/24/2018 06:58:41 ***
Web - Note created on 10/24/2018 06:58:41 and created by jeremy nelson
Found threads pulled from cylinder block, no signs of overheating, heads are not warped. Replacing engine assy through cpo warranty, please close case. Service Manager

1: I have generated a PWA case for you; please validate the vehicle warranty so the PWA can be approved.
Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
If you no longer need any assistance, please close this case and take the technician survey. Thanks.

*** 10/10/2018 09:07:45 ***
Web - Problem Description created on 10/10/2018 09:07:45 and created by Jeromy Williams
Customer brought vehicle to us stating a weird squeaking noise and coolant leaking

*** 10/10/2018 09:07:46 ***
Web - Diagnostics created on 10/10/2018 09:07:46 and created by Jeromy Williams
Found blown LH head gasket, with vehicle in air can see lots of coolant and oil has been leaking, Squeaking noise is coming from rear upper head, possible oil contamination has caused damage to cams/ bearings very loud squeaking under load/throttle, Used block tester and found combustion gasses in coolant, oil cap also has lots of white on it and the oil filler neck indicating oil contamination,

I'm guessing by this point in the damage that the vehicle will need a new engine, Please let me know if any further diag is required or if i need to do a pwa or different repair, Thanks

*** Web - Advice created on 10/10/2018 09:27:16 and created by Eric Patterson ***
1: Perfect Jeremy, Thanks for all the attachments to the case.

Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.
2: I have a feeling the block has been compromised. If the vehicle is under warranty, the heads will need removed for inspection. But we will need to torque down the head bolts to 80 Ft lbs and see if the head bolts are stripped in the block especially near the affected cylinder. If they are please let me know. Then we will need to measure the heads for warpage.
3: Or if you find and cam cap damage please add it to the case so I can recommend a long block. But we will need to tell the rebuilders if the block is damaged before sending it back.

*** 10/10/2018 11:18:23 ***
Web - Note created on 10/10/2018 11:18:23 and created by Jeromy Williams
Customer is original owner with 10/100 I am working on pulling valve cover off now to check cam caps, If no damage there i will start pulling heads off and torquing head bolts to check for block damage on head bolt threads.

*** 10/10/2018 11:47:27 ***
Web - Note created on 10/10/2018 11:47:27 and created by Jeromy Williams
Uploading pictures of exhaust cam cap, This is the cap on the exhaust cam furthest to the drivers side of engine, this is where to me it sounded like the squeaking noise was coming from, all 4 pictures are of the same cap, I was trying to give a good view because i don't know how good the pictures come through on your end, But the cap looks scored to me

*** Web - Advice created on 10/02/2018 06:29:31 and created by Steven Okimura ***
1: Please remove the valve cover and take a few photos of the valve train (not the valve cover) to determine if the engine was maintained properly, attach the photos to the case.
Try torqueing down the head bolts near the leak, if the head bolts fail to tighten the block should be replaced. If this is the case, attach an engine core data form and I will create a PWA case for you.

1: Hello Francis
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

Case History

*** 10/03/2018 12:01:30 ***
Contact = Joshua Martin, Priority = Standard, Sub Status = Dispatched

*** 10/03/2018 12:01:30 ***
Web - Problem Description created on 10/03/2018 12:01:30 and created by Joshua Martin
vehicle came in for over heating .. found vehicle gallon and a half low on coolant. found signs of dried coolant near reservoir jug

*** 10/03/2018 12:01:30 ***
Web - Diagnostics created on 10/03/2018 12:01:30 and created by Joshua Martin
filled vehicle up with coolant and no leaks were found.. after running vehicle with purge tank found allot of bubbles coming from coolant system,, test drove vehicle and found it starting to over heat and push coolant out of reservoir. found cooling fans in good operation

*** 10/03/2018 12:28:28 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin defaults

*** Web - Advice created on 10/03/2018 12:34:37 and created by Sam Camarillo ***
1: I have seen leaks around the cylinder to block mating areas. If you inspected there and If none found do a block test and report findings

*** 10/03/2018 13:00:19 ***
Web - Note created on 10/03/2018 13:00:18 and created by Joshua Martin
no leaks found on engine, test showed that combustion gasses are present in cooling system.

*** Web - Advice created on 10/03/2018 13:12:30 and created by Sam Camarillo ***
1: Please check the head bolts for looseness. see if you can torque any easily accessible to 45-50 lbs

*** 10/05/2018 11:44:58 ***
Web - Note created on 10/05/2018 11:44:58 and created by Joshua Martin

i have to remove timing cover, chains and all 4 camshafts to access bolts.. found all bolts torqued over 55 lbs

*** Web - Advice created on 10/05/2018 11:58:10 and created by Sam Camarillo ***
1: OK that is unusual as I normally see a couple loose ones due to pulled threads cause the gasket to go. Pressurize the system and see if you get any coolant leaking into a cylinder, this way we will have an idea which ones are potentially loose.

*** 10/08/2018 11:59:44 ***
Web - Note created on 10/08/2018 11:59:44 and created by Joshua Martin
after reinstalling that take assy , i refilled coolant system with coolant and pressurized system. let sit for 1 hour and inspected inside of cylinders with bore scope. found coolant in both middle cylinders on both banks..should i remove head and send to machine shop to inspect for warped??

*** Web - Advice created on 10/08/2018 13:03:56 and created by Sam Camarillo ***
1: Do you see any scoring in the cylinders from the coolant leak? If so we can stop there. If OK then get approval to pull head and send out.

*** 10/09/2018 07:18:38 ***
Web - Note created on 10/09/2018 07:18:38 and created by Joshua Martin
not visible with bore scope, poor picture quality will further inspect when heads are removed.. will seek dpsm approval

*** Web - Advice created on 10/09/2018 08:39:19 and created by Sam Camarillo ***
1: OK thanks, keep me posted.

*** 10/24/2018 06:46:50 ***
Web - Note created on 10/24/2018 06:46:50 and created by Joshua Martin
received heads from machine shop heads checked ok for war-page and they preformed valve job and replaced all valve stem seals ... when attempting to reinstall heads pulled 2 sets of threads

*** Web - Advice created on 10/24/2018 07:00:14 and created by Tony Thomas ***
1: Please attach a photo of the bolts with the threads and if warranty is valid, attach a copy of the required WRTY143 engine core data form (PS561) and a PWA will be generated for you. The form must be filled out (all available sections) and signed and dated by the service manager and technician.

*** Web - Advice created on 10/25/2018 07:12:58 and created by Tony Thomas ***
1: Based on the information provided, I recommend that you replace the engine following normal service procedures. Replace the engine with a long block, if available. If a long block is not available replace the short block and follow TSB ENG190 best practices for engine component re-use guidelines to build a long block. I have generated a PWA case for you. Please validate the vehicle warranty and the PWA will be auto approved. If you do not validate the warranty, you do not have approval to replace the engine. Please close the repair assistance case if no further assistance is required. Thank you.

*** 10/25/2018 07:13:23 ***
PWA Case created for RA Case 12891633 by Tony Thomas

*** 10/30/2018 08:13:26 ***
You have validated the warranty and the completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures.Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

CUSTOMER STATES CAR OVER HEATING AND COOLANT LEAKING TEMP WENT ALL THE WAY INTO RED. WAS HERE LAST WEEK WE REPLACED THERMOSTAT ASSEMBLY AND FLUSH COOLANT SYSTEM DUE TO WRONG COOLANT. VEHICLE HAD DEXCOOL (ORANGE) COOLANT. AND PERFORMED COOLANT SYSTEM PRESSURE TEST.(PASSED)

*** 10/12/2018 09:04:57 ***
Web - Diagnostics created on 10/12/2018 08:58:48 and created by mark gomez
VERIFIED CUSTOMER CONCERN FOUND COOLANT IS LEAKING BETWEEN CYLINDER HEAD AND THERMOSTAT HOUSING SEAL. PERFORMED A COOLANT PRESSURE TEST AT 16 PSI. HELD PRESSURE FOR 5 MINUTES. PERFORMED A BLOCK TEST AND HAD A FAILED RESULT. POSSIBLE BLOWN HEAD GASKET OR CRACK HEAD OR BLOCK PLEASE ADVISE

*** 10/12/2018 09:12:34 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 10/12/2018 09:13:07 and created by Brian Lall ***
1: Please take pictures showing the source of the leak you found between the head and thermostat housing. I am a little confused, how did you verify a leak then find that the pressure held at 16psi. Please do a pressure test for at least 20-30 mins and note if you can verify an external leak.

*** 10/12/2018 11:23:14 ***
Web - Note created on 10/12/2018 11:23:14 and created by mark gomez
THE VERY FIRST TIME IT CAME IN I PERFORMED A COOLANT PRESSURE TEST AND FOUND THERMOSTAT HOUSING WAS CRACKED AND LEAKING COOLANT. AFTER REPAIR I PERFORMED A COOLANT PRESSURE TEST AND VERIFIED NO LEAKS WAS PRESENT. JUST PERFORMED A COOLANT PRESSURE TEST AND LET HOLD FOR 30

MIN AND HELD AT 16 PSI. SENT PICTURE OF THERMOSTAT HOUSING TOP VIEW, IT IS VERY DIFFICULT TO SENT PICTURE OF BOTTOM OF HOUSING (TIGHT FIT). SEEMS IF COOLANT SYSTEM IS BUILDING PRESSURE AND FINDING ITS WAY PASSED SEALS.

*** Web - Advice created on 10/12/2018 13:52:06 and created by Brian Lall ***
1: I know the block test failed but to determine if the problem is on one bank or both banks, perform a cylinder leak down test on all cylinders and note the percentage of leak down and note where the air is escaping from during the test (radiator, intake, exhaust, another cylinder, or crankcase) and inspect the spark plugs.

*** Service Alert Escalated to CA as: 12902769 on 10/13/2018 01:07:15 (PST)

*** Web - Advice created on 10/23/2018 06:03:29 and created by Brian Lall ***
1: Thanks for the video. I can see the coolant leak but it is hard to determine if it is coming from the head gasket or a component above it or on the back of the head and running along the head gasket edge and then down. Are you sure it is from the head gasket?

*** 10/23/2018 08:07:19 ***
Web - Note created on 10/23/2018 08:07:19 and created by mark gomez
I DOUBLE CHECKED COOLANT LEAK AND YES ITS COMING FROM THAT AREA BETWEEN CYLINDER HEAD AND BLOCK. I ALSO NOTICE COOLANT RESIDUE ON CAT. CONVERTER AND O2 SENSOR AND ON SIDE OF CYLINDER HEAD AND STARTER.

*** Web - Advice created on 10/23/2018 08:49:11 and created by Brian Lall ***
1: Please get authorization to remove the head from your DPSM, but before removing it check all the head bolts especially in the area around the leak and if you find any that are loose note if they have the threads from the block on them when they are removed or if they will tighten up or just continue to spin note it in the case and if you can see any damage take pictures for documentation and attach them to the case. Thanks.

no heat, temp gauge went all the way to hot.

*** 11/05/2018 07:07:56 ***
Web - Diagnostics created on 11/05/2018 07:07:56 and created by George Kammerle
Added 1 gallon of coolant to rad. Rad and over flow both smell like fuel. I have non stop bubbles in the rad. Pressure tested the cooling system and it will not hold pressure. There are no external leaks visable. Also looks like the over flow lid popped off and sprayed coolant all over the right side of car. I removed the intake and the rear valve cover and found that 3 of the head bolts on the exhaust side are stripped. Free spinning in the block.

*** 11/05/2018 07:57:39 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 11/05/2018 08:01:05 and created by Jerry Gossling ***
1: George called in and stated the engine is overheating. The head bolts will not maintain a torque indicating the bolt holes in the cylinder block are stripped out. I recommended to replace the engine per Pitstop 539 and informed George his dealer is DSA and does not require a PWA case. So I will not be generating one.

1: Hello Timothy
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

Customer states that the engine overheated again and coolant reservoir is empty

*** 11/12/2018 08:20:12 ***
Web - Diagnostics created on 11/12/2018 08:20:12 and created by Jason Church
So this vehicle originally came in for this concern and I saw that the coolant crossover was leaking so I replaced all related gaskets and thermostat. Filled coolant and drove vehicle and it is no longer overheating. Now the vehicle is back overheating again and I saw that there was an external head gasket leak and a piece of the black on the head gasket was sticking out. I pressure tested the cooling system and it seems to be leaking right there. I was going to replace just the head gaskets for the external leak but when I removed the valve cover there is a lot of inter-mix and there is coolant on the dipstick. I have attached a picture of the valve cover.

vehicle was towed in. customer reported hearing a loud pop, saw white smoke and antifreeze starting leaking.

*** 11/14/2018 14:54:02 ***
Web - Diagnostics created on 11/14/2018 14:45:51 and created by Alvie Watson
found upper radiator hose exploded as well as the water pump making a noise. during replacement of those parts found coolant mixed with oil in the water pump jacket. after finding that i moved to replacing the head gaskets, head bolts and components concerning head gasket replacement. once i began removing the head bolts i noticed that two of the rear head bolts on the RH head where not tight and i seen alittle debris on the bolt. i cleaned it up and began to put it back together and those same two head bolts would not tighten. i then removed the new bolt to see what the issue was and the threads where full of aluminum. i understand vehicle is still under factory power train warranty and i was wondering as to what steps should be taken. i fear that those two bolt holes for the head will not be the only ones with a issue due the pressure that caused the failure. i believe the pressure in the coolant system caused the factory bolts to pull the threads.

Web - Diagnostics created on 11/14/2018 07:30:36 and created by tom michel
Vehicle came in 2 weeks ago for same concern. During first visit I checked coolant level and inspected vehicle for leaks. Coolant reservoir was empty and low in radiator. I pressured tested system at 15 psi for approximately 30 minutes, pressure remained and did not drop. Did not find any evidence of a leak either. Refilled and bled air from cooling system. Verified heat operation, customer left with vehicle. Performed same tests today and found reservoir empty and low in radiator. Pressure did not hold and found coolant coming from front engine head gasket. I can visually see evidence of leakage coming down and back around transmission and subframe/cradle.

1: Based on the information provided, I recommend that you replace the engine following normal service procedures. Replace the engine with a long block, if available. If a long block is not available replace the short block and follow TSB ENG190 best practices for engine component re-use guidelines to build a long block. I have generated a PWA case for you. Please validate the vehicle warranty and the PWA will be auto approved. If you do not validate the warranty, you do not have approval to replace the engine. Please close the repair assistance case if no further assistance is required. Thank you.

THE CUSTOMER STATES THE VEHICLE WAS OVER HEATING

*** 11/16/2018 11:56:26 ***
Web - Diagnostics created on 11/16/2018 11:56:25 and created by Ramiro Soto
I COULDN'T VERIFY THE CUSTOMERS OVER HEATING CONCERN. I FOUND THE COOLING SYSTEM LOW. I TOPPED OFF THE COOLING SYSTEM, GOT THE ENGINE TO OPERATING TEMP, CHECKED FOR COMBUSTION GASES IN THE COOLING SYSTEM, PRESSURE TESTED FOR LEAKS AND CHECKED THE COOLING FANS FOR PROPER OPERATION. I FOUND SIGNS OF A LEAK AT BANK 2 REAR CORNER OF THE CYLINDER HEAD. CURRENTLY NOT LEAKING, JUST WHAT APPEARS TO BE OLD COOLANT. THE ENGINE IS CURRENTLY OPERATING AS DESIGNED, BUT HAS LEAKED COOLANT AT SOME POINT. NO IM NOT SURE IS IF I SHOULD REPLACE HEAD GASKETS OR LONG BLOCK.

*** 11/16/2018 12:23:41 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin default

*** Web - Advice created on 11/16/2018 12:25:44 and created by Greg Phillips ***
1: Make sure there is no external cause for the overheat first. Cooling fans blocked or inop, etc. The, if you have coolant leaking externally from that head gasket, I would pull that valve cover and check the head bolts that you can reach without removing the camshafts and see if any of them are loose and cannot be torqued down.

*** 11/16/2018 15:36:32 ***
Web - Note created on 11/16/2018 15:36:32 and created by Ramiro Soto
I CANT PUT A SOCKET ON THE LOWEST CORNER HEAD BOLT WHERE THE LEAK IS BECAUSE OF THE CAM POSITION RELUCTER.

*** Web - Advice created on 11/19/2018 06:49:24 and created by Greg Phillips ***
1: Did you check the other bolts that you can reach though? They are all holding their torque? And did you find any combustion gasses in the coolant when you ran your block test earlier? Have you asked the customer if somebody else has been working on this recently? Perhaps that coolant is from an earlier repair and it was not refilled and bled properly?

*** 11/19/2018 10:07:57 ***
Web - Note created on 11/19/2018 10:07:57 and created by Ramiro Soto
THERE WAS NO COMBUSTION GASES IN THE COOING SYSTEM, THE TWO HEAD BOLTS THAT I COULD TORQUE WERE TIGHT AND THE VEHICLE WAS IN 14K MILES AGO FOR AN OVER HEATING CONCERN THAT WAS DUE TO LOW COOLANT CAUSED BY RODENT DAMAGE TO COOLANT HOSES. OUR NOTES INDICATED THERE WASN'T COMBUSTION GASES IN THE COOLING SYSTEM AT THE TIME. I DID FIND WHAT LOOKS LIKE SIGNS OF COOLANT GETTING IN THE OIL ON THE VALVE COVER. NOT SLUDGE LOOKS MILKY.

1: Have you put a bore scope into the cylinders to see if there is any visible cylinder wall or piston damage? You might apply light pressure to the cooling system when you do this, to see if any cracks become visible. And can you also give me a photo of the valve train?

Web - Note created on 11/19/2018 14:06:55 and created by Ramiro Soto
I DON'T SEE ANY DAMAGE BUT THE IS SOME MOISTURE AT THE HEAD BLOCK DECK SURFACE IN CYLINDER 6. ALL OTHERS ARE DRY WITH 14 PSI APPLIED TO THE COOLING SYSTEM. THERE ISN'T MUCH FOR SLUDGE/SIGNS OF C COOLANT CONTAMINATION TO THE VALVE TRAIN.

*** Web - Advice created on 11/19/2018 14:46:04 and created by Greg Phillips ***
1: Not really puddling severely in the cylinder though?

*** 11/19/2018 14:55:49 ***
Web - Note created on 11/19/2018 14:55:49 and created by Ramiro Soto
NO NOT REALLY. THE TOP OF THE PISTON WAS DRY. JUST THE MOISTURE YOU SEE THERE.

*** Web - Advice created on 11/20/2018 07:09:25 and created by Greg Phillips ***
1: Ok, so you definitely have enough evidence to suspect a blown head gasket, but not enough to suspect a damaged engine. You did have what appeared to be some moisture in the valve cover, but it was light. There didn't appear to be any in the valve train, though there were some spots that looked like they might have been a little bit washed. You definitely have some washed pistons, but not enough coolant puddling in the cylinders to say it likely has a bent rod (coolant does not compress). And the head bolts you can reach appear to be tight. There is one more thing I would check before moving on to removing the head. I would check for coolant in the crank case, and how much if any. How is the oil level on this? Does it seem overfilled? I would pull the drain plug and see how much water comes out, if any, before the oil actually starts to drain. If there is no coolant in the crank case, I would move on to removing the head, with DPSM authorization, to further inspect the cylinders and pistons, and measure the head and block for warpage. If you find any loose head bolts once the cam shafts are removed, same as before see if they can be torqued. If they cannot, please stop and let me know.

*** 11/21/2018 08:43:58 ***

Web - Note created on 11/21/2018 08:43:58 and created by Ramiro Soto
THE OIL LEVEL IS AT THE FULL MARK AND I DRAINED THE OIL AND FOUND A SLIGHT HAZE OF IN THE OIL NOT TO CAUSE DAMAGE TO THE BEARINGS. ILL GET DPSM AUTHORIZATION TO PULL HEADS.

customer is requesting flight recording to be installed, reference to case #12833323, customer declined to have flight record installed last visit but is now requesting to have it installed

10/22/2018 08:48:00 and created by Felipe Moreno

customer is requesting flight recording to be installed, reference to case #12833323, customer declined to have flight record installed last visit but is now requesting to have it installed

*** Web - Advice created on 10/22/2018 09:31:02 and created by Frank Lusic ***
1: Hello Felipe
If you are unable to duplicate the concern then I suggest that a Flight recorder be requested from us by your service manager then connect it to the vehicle,
Set it up to capture all engine data, Then tell the customer to press the button after the concern occurs, If the customer agrees to this
In order for us to send you a flight recorder I will need your service manager's name and e mail address so I can send him the consent form. It's very important to let the Service Manager know that it's only necessary for them to sign the form in order for use to send the recorder out, the customer does not need to sign the form. It's up to Service Manager whether or not they want to have the customer sign the form this only releases liability from dealer not KMA.
Please attach this information to the case notes, Thank you

1: Justin,
We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the OCVs. If either of these two items has failed inspection, please let me know before continuing. We will also need to measure the cylinder heads for warping and see if they are within specs.

*** 11/28/2018 07:00:20 ***

*** Web - Advice created on 11/28/2018 07:23:52 and created by Chris Schang ***
1: Justin,
So likely the threads have come out of the block. We can approve the engine based on this, but when you disassemble the block, you will have to measure the head deck for warping. If the heads are warped, they will have to be replaced and nothing additional will be needed. They are covered under the PWA approval. If they are not warped, they can be reused with new seals and gaskets.
2: Can you attach the WRTY-143 form to the case and I can approve the case.

External coolant leak,another lube place said that the intake was leaking coolant.

*** 11/29/2018 06:03:24 ***
Web - Diagnostics created on 11/29/2018 06:03:01 and created by Mike Steitz
Found coolant leaking at left(frt) cylinder head at the lower back corner. When removing head I noted that the corner head bolt was loose. I removed cylinder head and checked for head wattage. Head is ok. Went to put head back on after thorough cleaning. Lower corner head bolt was binding immediately. Went to run a clean up thread chaser down all head bolt holes. Corner hole had threads come out with it. Please advise. See attached pictures.

1: Hello Henrick
en cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings
2: To remove the oil from the cooling system please use Shout laundry detergent with just water in the cooling system and the thermostat out then let the engine idle for about 30 minutes the flush with clean water then repeat if necessary

1: Hello Randy

There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts , Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** 12/06/2018 10:38:54 ***

Customer States that the engine has an internal coolant leak and check engine light on.

*** 12/07/2018 08:36:19 ***
Web - Diagnostics created on 12/07/2018 08:36:19 and created by Jose Pedroza
Retrieved code P0301 and P0305. Inspection found that the engine was smoking from the tail pipe and that the oil was brown in color, (coolant mixed with the oil). Started a PWA with the DPSM and he approved the head gasket replacement. I want to know if I should replace the short block because of the excessive amount of coolant in the oil. The bearing are not making any noise at this time. Found aftermarket clamps on the heater hoses and coolant stains on the firewall.

*** Web - Advice created on 12/10/2018 12:23:34 and created by Chris Schang ***
1: Joe,
If it is determined that we need to replace the engine, we will either need a valve train photo or maintenance records if the valve train shows sufficient lack of maintenance. I would first start with removing the valve cover and check the torque on the head bolts and see if any are stripped. Set your torque wrench to 80 FT LBS and see if any spin freely. Let me know what you find.

*** 12/10/2018 13:36:04 ***

sent in pics and can not tighten head bolts cause the cams are in the way. cant reuse head bolts anyways.

*** Web - Advice created on 12/10/2018 13:46:05 and created by Chris Schang ***
1: Joe,
We need to determine a reason to replace the engine and show bottom end damage. If the vehicle overheated, there may be scoring to the cylinder, warping of the block deck, but I cannot approve an engine replacement without some confirmation of this. At this time, I would get DPSM labor approval to remove the cylinder heads and check the heads and block deck are warped or if there is scoring on the cylinder walls.

Web - Note created on 12/10/2018 13:53:11 and created by Joe Kirk
i dont need an engine i just need a head gasket. i just didn't know if i needed customer records. goes back to the begining does he need to provide service records or not?

*** Web - Advice created on 12/10/2018 14:01:05 and created by Chris Schang ***
1: Joe called in,
Tech was inquiring if the customer needed maintenance records for tear down or head gasket replacement. Tech is advised that the clean valve train photo was sufficient for maintenance verification and can now move forward with disassembling the engine and inspecting if only head gaskets are needed or if long/short block replacement is needed.

*** 12/17/2018 15:49:50 ***

1: Charles,
Thank you for the information.
Please remove the valve covers and rocker shaft assemblies. Next see if the head bolts will maintain a 60 FT LBs of torque (By using your torque wrench). Please list the results of the test.
Thank you

*** 11/16/2018 08:38:13 ***
Web - Note created on 11/16/2018 08:38:13 and created by CHARLES SLADKY
OK, SO I UNDERSTAND , LOOSEN AND RE TORQUE TO 60 OR SEE IF THEY ARE AT 60 AND HOLD. THANKS

*** Web - Advice created on 11/16/2018 09:21:14 and created by Jerry Gossling ***

1: Charles,
Don't loosen the head bolts. Just see if the head bolt will maintain a 60 FT LB torque with your torque wrench.
Thank you

*** 11/19/2018 12:27:31 ***
Web - Note created on 11/19/2018 12:27:31 and created by CHARLES SLADKY
to confirm , its the cam shafts that have to be removed to get to the head bolts. is there a tip on keeping the timing chain tensioner from jumping

*** Web - Advice created on 11/19/2018 13:34:53 and created by Jerry Gossling ***
1: Charles,
I don't think the timing chain jumping is going to be of concern at this point.
Thank you

*** 11/20/2018 09:46:56 ***

1: Hello Carl
Based on the information that you have provided the engine will need to be replaced, for approval
YOU MUST DO THE FOLLOWING
DO NOT OPEN A PWA CASE, You must attach a core to this case
Please refer to PS561

Before I can open a PWA case for approval I need you to please complete, sign and attach the REVISED WRTY143 Core Data Form dated 11/1/16 as outlined in Pit stop PS410 to this case to proceed. The form must have the RO#, mileage, date, VIN and be signed by technician and service manager.

,YOU MUST USE THE LATEST FORM !
To obtain the latest core form please do the following

Go to www.Kdealer.com , sign in with USER ID and password for access and log in. Click on FIXED OPERATIONS , then click on WARRANTY, then Warranty Forms .
Please add a case note so I will be made aware that the form is there, Thank you

1: Please torque the head bolts to 85ftlbs, any sludge in the engine ?

2: Does the car have power train warranty ?

*** 10/02/2018 08:34:01 ***
Web - Note created on 10/02/2018 08:34:01 and created by Allen Foster
Ok, So I understand you correctly, you want me to remove the camshafts to gain access to the head bolts so I can torque them to 85lbs??? Are you not concerned of possibly pulling the threads out of the block and over torquing? Im not sure exactly what this is going to achieve except maybe addition damage to the block or head surface? is this in a tsb or a pittstop?

no sludge present at this time just a little pancake batter.

yes vehicle has powertrain coverage.

*** Web - Advice created on 10/02/2018 12:04:48 and created by Mike Ozonur ***
1: Spoke with Allen and advised him to torque the cylinder head bolts and see if they tighten or not, if not remove the head bolts and attach a picture to the case, also advised tech to provide a picture of the valve train

*** 10/04/2018 13:45:49 ***
Web - Note created on 10/04/2018 13:45:49 and created by Allen Foster
Went ahead with the procedure as you advised me to tear down the engine to torque the cylinder head bolts to 85ftlbs torqued all the the bolts as outlined after putting the engine back together preformed leak test and found it was leaking down, and the the head gasket is still leaking in the same spot as before.

CUSTOMER STATED ON PREVIOUS REPAIR ORDER THAT SMOKE WAS COMING FROM THE TAILPIPE AND THE CHECK ENGINE LIGHT HAS COME ON.

*** 12/24/2018 11:27:19 ***
Web - Diagnostics created on 12/24/2018 11:27:18 and created by Ryan Debrecht
WE VERIFIED THAT HEAD GASKETS WERE LEAKING. WE TORE DOWN THE ENGINE AND HAD THE HEADS REFINISHED. ONE HEAD BOLT HOLE ON EACH BANK GOT STRIPPED OUT. DPSM STEVE RUPERT TOLD US TO HELICOIL THE BOLT HOLES. WE WERE WANTING TO REPLACE THE BLOCK DUE TO KNOWN ISSUES BUT THE DPSM TOLD US TO REPAIR THE BOLT HOLES. WE REPAIRED THE BOLT HOLES BY HELICOILING THEM AND PUT ENGINE BACK TOGETHER. AFTER APPROX 100 MILES AFTER REPAIR WAS COMPLETED ONE OF THE HELICOILS BLEW OUT AND THE HEAD GASKET IS LEAKING AGAIN. DPSM TOLD ME TO START A TECH LINE CASE TO GET THE BLOCK REPLACED ON THIS VEHICLE UNDER WARRANTY DUE TO THE REPAIR ORDER BEING CUSTOMER PAY AND KIA DPSM TELLING US TO USE HELICOILS.

*** 12/24/2018 11:28:20 ***

1: In a duplicate case the tech stated: oil leak

Web - Diagnostics created by John Daniels

removed intake to inspect for leak oil coming out of new oil pressure switch replaced switch and thoroughly cleaned started vehicle and inspected around switch can see oil bubbling from head gaskets now can i replace head gaskets or will kia want complete engine back to inspect for themselves

I have updated the RO# from 74514 to 77825 and the mileage from 4,868 to 6,867 as per the information shown in the duplicate case you opened.

2: If you are sure the oil leak is from the head gaskets take a video showing the source of the leak if possible (using the bore scope) then contact your DPSM for authorization to replace the head gaskets. If when removing the heads you find any head bolts loose or other damage stop and update the case. Thanks.

Web - Note created on 01/25/2019 07:40:06 and created by Benjamin Patrick
so I pulled bank 2 head off and put a straight edge in various spots and used a feeler gauge to check for block warp. I was not able to find any issues not saying that the block could be warped in an area I wasnt thorough with. I did notice when removing head bolts in bank 2 that 4 of the bolts were unusually tight when trying too loosen. what are your recommendations at this time? thanks

*** Web - Advice created on 01/25/2019 07:49:07 and created by Jerry Gossling ***
1: Benjamin,
Thank you for the information.
Did you check to see if the cylinder head itself was warped per the specifications in the shop manual?
Thank you

*** 01/25/2019 08:50:10 ***
Web - Note created on 01/25/2019 08:50:09 and created by Benjamin Patrick
checking only bank 2 head I used .005mm feeler gauge with a straight edge and to the best of my ability could not find any warped spots. should I send to machine shop for further check. we have had an issue very similar here and another technician went thru the same procedure and just did head gaskets and had heads checked and found within spec to later have issues with the block afterwards.

*** Web - Advice created on 01/25/2019 08:56:12 and created by Jerry Gossling ***
1: Benjamin,
Thank you for the information. Please check the cylinders for any kind of scoring.
Next see if any of the head bolts on bank 1 will NOT maintain a 60 LBS of torque.
Thank you

1: Perfect. TY
2: : We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also

check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
3: TY, this way we will know if the block is reusable. If there is milky oil please add a picture as the bearings will be compromised and the engine should be replaced anyways.

*** 01/09/2019 10:45:54 ***
Web - Note created on 01/09/2019 10:45:54 and created by Raymond Carroll
Was sick for five days. Took engine apart today took the camshafts out try to torque the head bolts to 80 foot pounds bolts stripped out about 35 foot pounds and started spinning

*** Web - Advice created on 01/09/2019 13:40:14 and created by Eric Patterson ***
1: Thank you for the update.

If the heads are warped we will re use the valves and springs etc. Be careful and check the cylinder heads for missing check balls and install them if necessary.
2: Please check the cylinder heads and see if they are warped. If they are then please replace them and add a picture of the case of the strait edge and the feeler gauge. Or the machine shops invoice showing the heads were warped and the measurement. Otherwise please add a picture of the stripped threads a swell.
3: Please attach the completed and signed WRTY143 [Rev. 11/1/2016] core data form to THIS case. Then I will create and or approve the case for you. Please see PS561 for the fields required on the form that need filled out for the approval.

1: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.
2: B: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

1: Hello Mark
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings
2: To remove the oil from the cooling system please use Shout laundry detergent with just water in the cooling system and the thermostat out then let the engine idle for about 30 minutes the flush with clean water then repeat if necessary

customer states overheating. verified looses coolant and overheats when low on coolant.

*** 01/10/2019 07:55:58 ***
Web - Diagnostics created on 01/10/2019 07:55:58 and created by Daniel Vertrees
inspect for coolant leak, no external coolant leaks. first video with green coolant is on arrival when I filled the cooling system and was bleeding it before test drive. after running for 15 minutes there was still a steady stream of bubbles. lowered coolant level and ran vehicle for 15 minutes, performed block test (see photos), passed block test. refilled with water and ran vehicle for 10 minutes, steady stream of bubbles the whole time second video with water). perform fan PWM test, cooling fan working correctly. in my experience with these symptoms it is the head bolts pulled threads from the block. is there a procedure or recall in the works for this or how should I proceed?

1: If it passes the block test, it does not have combustion gasses in the cooling system but it may be passing coolant to the

combustion chamber. Remove the plugs, pressurize the cooling system to hold pressure, let it sit for a while and check the cylinders for coolant. If you find coolant in one of the cylinders, test the torque of the head bolts prior to removing the head. If they spin and pull the threads from the block, the engine will need to be replaced rendering the necessity of removing the head unnecessary. Thank you.

Web - Problem Description created on 12/28/2018 10:51:14 and created by James Baker
The customer is concerned about a oil leak. The vehicle was here 11/20/2018 at 94,242 miles had found the engine galley was full of oil and was coming out of the bottom of the bell housing. I replaced the oil pressure switch and cleaned out the oil.

*** 12/28/2018 11:05:31 ***
Web - Diagnostics created on 12/28/2018 10:51:14 and created by James Baker
The vehicle is back with the same concern of a oil leak. Inspected and found the engine galley is full of oil again and dripping out of the bell housing. cleaned the oil out of the galley with degreaser and water. Inspected the oil pressure switch with a bore scope the switch is not leaking. Added engine oil dye and ran the vehicle for a while until the I could see some oil starting to build up. It is coming from the head gasket area on the back bank looking down into the galley oil was building. Have heard that there are concerns with the head bolts?

*** Web - Advice created on 12/28/2018 11:15:43 and created by Frank Lusic ***
1: Hello James
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** Service Alert Escalated to CA as: 12989961 on 12/29/2018 01:06:44 (PST)

1: Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.

Then please perform a block check and add a short video or a clear picture of the fluid color after the color change please. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.
2: If the block check has failed please see below.
3: : We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

*** 12/14/2018 15:56:47 ***

Web - Problem Description created on 01/15/2019 06:25:45 and created by Gary Turner
crank no start, no heat, reduced engine power, per service advisor.

*** 01/15/2019 07:30:30 ***
Web - Diagnostics created on 01/15/2019 06:25:46 and created by Gary Turner
attempted to start engine, sounded as if the engine has no compression. Scanned for dtc's, p0306. Removed cylinder 6 spark plug. Completely fouled with what appears to be engine oil. Visually inspected and found engine/ trans completely covered in oil and coolant. Radiator completely empty. Attempted to fill coolant, added about 4 gallons and stopped knowing it was too much and going somewhere. No visible leaks present while filling with coolant. Drained engine oil, suspecting coolant was entering engine. No coolant came out. Pressure tested cooling system and coolant is gushing out of cylinder 6 spark plug tube. See attached video. The real question here is what caused the engine to overheat...the root cause of engine failure...

*** 01/15/2019 07:48:57 ***
Web - Note created on 01/15/2019 07:48:57 and created by Gary Turner
also note, spark plug still removed, coolant is leaking from weep hole in muffler. I would suspect exhaust side combustion leakage, with catalytic converter contamination.

1: Thank you for the video and the pictures.
At this point the heads will need to come off and we will need to determine if the heads and the block are warped. You can get DPSM labor approval to perform this. Once the heads are off, attach a photo of the valve train for maintenance verification. If the cylinder heads and/or the block is warped, we are looking at engine replacement. If nothing is warped, the head gaskets and head bolts can be replaced along with anything else that cannot be reused. Give me a call if you have any questions. If none, let me know what you find.

Let me know what you find as far as block and head warping.

*** 01/16/2019 04:35:45 ***
Web - Note created on 01/16/2019 04:35:45 and created by Gary Turner
Gave information to service manager to relay to DPSM. In my opinion, this was deliberate and did not accidentally happen.

*** Web - Advice created on 01/16/2019 06:25:32 and created by Chris Schang ***
1: Gary,
How would this be deliberate?

*** 01/16/2019 06:36:04 ***
Web - Note created on 01/16/2019 06:36:04 and created by Gary Turner
they drove it knowing it was overheating. All of the leaks the engine has didn't just happen. There is fluid baked on to the exhaust. Poor vehicle maintenance. Not changing the oil at regular service intervals. That's just my opinion from what I can physically see.

*** Web - Advice created on 01/16/2019 07:23:30 and created by Chris Schang ***
1: Gary,
Your dealership has DSA privileges so if your manager deems this to be negligence, that would be up to them. I understand

where you are coming from, however, this would be difficult to prove.

*** 01/16/2019 07:36:18 ***
Web - Note created on 01/16/2019 07:36:17 and created by Gary Turner
I totally understand that. And I understand it would be difficult to prove. I'm waiting on oil change records. What we have is that the vehicle hasn't been here in 30000 miles. I can only speculate, but what I think happened is that the oil was not properly maintained, from what I drained out of the engine had to be only a couple of quarts, and what oil was there was sludge and completely broken down. Which , in turn caused undo stress on the engine, which in turn, caused it to overheat.

*** Web - Advice created on 01/16/2019 08:55:17 and created by Chris Schang ***
1: Gary,
Can you attach a photo of the valve train for review?

1: Gary,
The valve train appears to be clean meaning someone somewhere was doing the services. If an independent facility was performing this, they may have used inadequate oil if you state it is broken down, but I do not see enough evidence to deny the claim.

*** 01/16/2019 10:58:23 ***

PWA Case 13021435 created by Chris Schang

*** Web - Advice created on 01/23/2019 15:23:59 and created by Chris Schang ***
1: Gary,
I have generated a PWA case for you; please validate the vehicle warranty so the PWA can be approved
Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

1: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
3: Then measure the heads for warpage.

*** Web - Advice created on 01/14/2019 15:58:05 and created by Eric Patterson ***
1: Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.

Web - Problem Description created on 01/22/2019 08:37:38 and created by Zachary Epperly
Customer sates: Vehicle blowing smoke from exhaust, coolant is leaking externally from the engine.

*** 01/22/2019 08:37:38 ***
Web - Diagnostics created on 01/22/2019 08:37:38 and created by Zachary Epperly
Confirmed customer concern. Found coolant level extremely low. Oil appears to be mixed with coolant. Exhaust gasses are venting from the radiator fill hole. We have had quite a few similar customer concerns which have all turned out to be the bank 2 head bolts on the rear side of the engine stripping the threads out of the block. Recommend long block replacement.

1: Zachary,
You have validated the warranty and the completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

Thanks

1: Please attach the WRTY 143 PWA form to this case. My recommendation is to replace the engine after getting PWA approval if needed. Please verify if the vehicle has a valid power train warranty. If it does have a valid warranty, Techline can now create a PWA case automatically from the repair assistance case once all information is provided, so you do not need to do it. Thanks.

Customer states heater has been not working for a few weeks now, no hot air coming out.

*** 01/26/2019 13:55:23 ***
Web - Diagnostics created on 01/26/2019 13:55:23 and created by Crystal Kindred
Verified customers concern found heater to be inop. Scanned for dtc's, none found. Verified operation of all HVAC door actuators. Checked coolant level, found to be 1/2 gal low. Topped off coolant level, started veh, verified operation of heater. Performed visual inspection of cooling system, found no signs of leaks. Test driven veh, during test drive noticed a lot of white smoke from exhaust and notice water on road behind veh whenever I hit the throttle. Brought veh back to shop, noticed coolant blowing out of overflow bottle and smoking. Removed radiator cap and performed block test (failed). pic attached

*** 03/04/2019 17:07:28 ***
Case Number: XXXXXXXX Reopen Requested by Crystal Kindred.
Reason: [update to case. Removed intake manifold, removed Bank 1 valve cover and both cam shafts, checked torque on cylinder head bolts found head bolt closest to front of engine on exhaust side to be at 11.9lbs, right behind it (next bolt) 18.4lbs then 44.8lbs then over 100lbs at back of engine on exhaust side. Theads came out with bolt on the front one that was only 11.9lbs. The loose head bolt is causing coolant to get past head gasket, causing smoke out tail pipe and heater to be inop due to low coolant. recommend engine replacement]

PWA Case created for RA Case 13026030 by Jerry Gossling

*** Web - Advice created on 01/29/2019 04:36:05 and created by Jerry Gossling ***
1: Humberto,
You are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it.
• Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.
Thank you

*** 02/12/2019 13:34:02 ***
You have validated the warranty and the completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures.Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

1: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.
2: : We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

1: The engine will need replaced. If the heads are warped they will need replaced. If they are within specs after the inspection with the strait edge please replaced the block with a reman block and send the heads out for inspection. Or if there is a long block available please use the long block reman engine.

*** 01/31/2019 15:48:02 ***

customer states engine coolant has leaked out, customer added water to get it to the shop,

*** 01/31/2019 14:54:35 ***
Web - Diagnostics created on 01/31/2019 14:54:35 and created by SHELTON GARVIN
upon inspection, there is a random misfire code, cylinder 4 and 6 misfire, with engine running there is bubbles going into coolant resivoir tank and vehicle temp starts to rise. there is also a rattling noise in the engine, the coolant seems to be leaking around the plastic coolant housing mounted on driver side of motor above the transmission, but have not fully determined that, i believe either a blown headgasket or cracked/warped head with lower end noise due to running out of coolant

1: based on information provided recommend to replace the engine assembly.
Before I can give approval I need you to please complete, sign and attach the REVISED WRTY143 Core Data Form to this case to proceed. The form must have the RO#, mileage, date, VIN and be signed by technician and service manager. Please add a note to the case once the form has been attached. Thanks.
2: replace the engine following normal service procedures. Replace the engine with a long block, if available, if a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.
3: For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

Customer stated the vehicle is overheating.

*** 01/31/2019 13:49:33 ***
Web - Diagnostics created on 01/31/2019 13:49:33 and created by David Nelson
Verified the customers concern. Checked the coolant and it is full. Checked operation of the thermostat and it is operating normally. Inspected the system for leaks and pressure tested the system and there are no leaks found on the vehicle. Tested the vehicle with a block tester and the fluid in the tester turned yellow indicating a blown head gasket. Verified this finding with our emissions machine and found the hdydrocarbon readings in the radiator are exceeding 300-350ppm.

*** Web - Advice created on 02/19/2019 10:28:07 and created by Douglass McKay ***
1: Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

C/S ENGINE IS OVER HEATING.

*** 02/11/2019 10:16:44 ***
Web - Diagnostics created on 02/11/2019 09:48:43 and created by Allan Aguiluz
INSPECTED ENGINE BAY AND FOUND COOLANT WAS COVER THE BACK AND TOP OF TRANSMISSION. I CHECKED COOLANT INSIDE RADIATOR AND FOUND COOLANT LEVEL WAS REALLY LOW. I TOOK ALMOST 1 GALLON TO FILL RADIATOR. THE FLUID INSIDE THE RADIATOR AND COOLANT RESERVOIR LOOKS LIKE CHOCOLATE MILK WITH THE MIXTURE OF OIL AND COOLANT. I REMOVED SPARK PLUGS 2, 4 AND 6 ON THE LEFT CYLINDER HEAD. THEY SHOWED SIGNED OF ENGINE OVER HEATING. I ALSO FOUND EXCESSIVE WHITE SMOKE TO BE COMING OUT OF TAILPIPE INDICATING COOLANT WAS GETTING IN TO COMBUSTION CHAMBER. ALL SEEMS TO INDICATE THE ENGINE HAS A BLOWN HEAD GASKET. I WILL UPLOAD VIDEOS AND PICTURES OF MY FINDING AS WELL AS A PWA FORM.

*** Web - Advice created on 02/11/2019 10:40:46 and created by Eric Patterson ***
1: Thank you for the information.

I can see the engine is damaged. The head gaskets are most likely the cause. We will need to check the block for the head bolt threads being compromised.
2: Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.
3: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

Accepted, from Queue = TL_Sorento_Sportage to WIPBin All Others

*** Web - Advice created on 02/06/2019 13:49:19 and created by Eric Patterson ***
1: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.

If there is no leaks found please see line 2
2: Then please perform a block check and add a short video or a clear picture of the fluid color after the color change please. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.
3: Next if the block check fails or there is coolant seapage from the head gaskets: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

1: Hello Matthew
The completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you

have provided, you are authorized to replace the engine following normal service procedures. Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.
You will NOT be using a QQK part number
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.
Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

Vehicle overheating leaking coolant

*** 02/18/2019 11:47:08 ***
Web - Diagnostics created on 02/18/2019 11:47:08 and created by Brandon Brawner
Vehicle came in with no heat concern there was signs of thermostat housing leaking where it is connected together replaced and tested no leaks was present . Vehicle is back now with possible head gasket problem on bank 1 with system under pressure can see coolant seaping from around the head . there is signs of oil in the coolant from the resivior and oil cap. I performed a block test and it passed I have several pictures of the concern I am uploading for review

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin defaults

*** Web - Advice created on 02/19/2019 05:39:34 and created by Sam Camarillo ***
1: What I would recommend is make access to the head bolts around where you see the head gasket leaking. Try torquing them to around 45-50ft lbs. If any of them pull or spin you know the threads are damaged, it will need minimum of a short block.

*** 02/19/2019 07:49:19 ***
Web - Note created on 02/19/2019 07:49:19 and created by Matthew Kauffman
Removed rear rocker cover to access bolts, several bolts on bottom row will not pull down to torque. Is a PWA case required?

*** Web - Advice created on 02/19/2019 08:39:21 and created by Sam Camarillo ***
1: I see your store shows you are a DSA dealer, if this is still current no PWA is needed from TL to proceed
If this status has changed let me know.

2: Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.

PWA Case 13055338 created by Jerry Gossling

*** Web - Advice created on 02/19/2019 09:31:00 and created by Jerry Gossling ***
1: I have generated a PWA case for you; please validate the vehicle warranty so the PWA can be approved
Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083. Thank you

*** 02/25/2019 13:09:27 ***
Web - Note created on 02/25/2019 13:09:27 and created by david sheinin
My apologies, in order to photograph block treads pulled in head we will need to completely remove head- is that what is needed? Tech ran a known good bolt in and it jammed after 3 rotations in.

As seen in photos we also need radiator cleaned out and heater core replaced as well as all rubber coolant hoses replaced

*** Web - Advice created on 02/25/2019 13:12:54 and created by Tony Thomas ***
1: If the bolts pulled the threads from the block, they would be on the bolt threads. The bolts attached are clean. If the threads were pulled from the block, the new bolt would just spin without getting tight.

*** Service Alert Escalated to CA as: 13063427 on 02/26/2019 01:06:49 (PST)

*** 02/26/2019 05:32:34 ***
Web - Note created on 02/26/2019 05:32:34 and created by david sheinin
My apologies, the block treads are not stripped, they are pulled like a oil pan that did not have drain plug gasket changed and was just over tightened-sharp and will soon be pulled out. Engine block head bolt treads are compromised. This vehicle will also need heater core and radiator sent out and attempted to be cleaned out (not sure if it will be able to be cleaned) as well as all rubber coolant hoses replaced due to oil/ coolant mixing attached photos of oil/coolant mixed

*** Web - Advice created on 02/26/2019 05:35:40 and created by Tony Thomas ***

1: Travis, the photos and videos are great, and much appreciated, but please also remember to detail your findings and diagnostics in the case notes. For information that we can't see in the videos, for example, and for people in other departments who may not be able to access the attachments. Files reviewed indicate engine compression in the cooling system, and the following DTCs P0116 - P2273 - P0306 - P0560.

Have you looked at your temp reading to see if your P0116 is a result of the overheat, or a possible contributing factor/cause? And I would be looking at that P0306 as well. Have you pulled the spark plug and checked to see if that cylinder is full of coolant? I would put a bore scope down that cylinder, with the piston at BDC, and inspect for damage to the piston and cylinder walls. Please provide any clear photos you can get of any damage you find. I'm also going to need photos of the valve train. I would probably pull off the bank 2 valve cover, since that seems to be the problem bank. Get your photo(s) of the valve train, and check any accessible head bolts to see if any of them are loose and cannot be torqued down. Any external leaks on that bank, like the head gasket?

*** 03/01/2019 09:37:43 ***
Web - Note created on 03/01/2019 09:37:43 and created by travis rennick
six of 8 bolts on bank 2 completely stripped out, the cause of the over heating was a faulty thermostat

1: Please attach one or two clear, well lit photos of the valve train to the case. IF you find sludge in the engine, then you will need to get the customer's service records. If you have verified there has been no abuse or external impact, the engine is not used or from a junk yard, and the warranty is valid according to WEB DCS, you will also need to review warranty bulletin 2015-09 and attach the completed and signed WRTY 143 core data sheet to this case.

PWA Case 13081388 created by Greg Phillips

*** Web - Advice created on 03/11/2019 14:29:08 and created by Greg Phillips ***
1: I have generated a PWA case, 13081388, for you. If this has valid warranty, please validate the vehicle warranty, in the new PWA case, so the PWA can be approved. Then please close this case and fill out the survey.

Based on the information you have provided, I recommend that you replace the engine following normal service procedures, after you validate the warranty in the new PWA case and receive approval. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

This vehicle has had several oil leaks repaired.It is back at our dealership again with another oil leak.

*** 03/08/2019 05:35:57 ***
Web - Diagnostics created on 03/08/2019 05:35:57 and created by curt langstaff
I cleaned the entire engine and frame..i cleaned out the oil galley on the engine block.I test drove the vehicle for 25 miles then put it back on the lift to inspect for leaks.
I can see oil seepage from where the cylinder heads meet the engine block.the oil then travels down the transmission case until it starts to drip on the ground.
this vehicle previously has had the valve cover gaskets,oil pressure switch ,and oil filter housing replaced.

1: Do you have any cylinders that are misfiring? i would suspect those are the ones ingesting coolant.
Check for any external leaks around the cylinder head. If the vehicle overheated badly the head probably warped and most likely pulled the head bolts from the block

*** Service Alert Escalated to CA as: 13083700 on 03/13/2019 01:04:46 (PST)

*** 03/18/2019 12:12:55 ***
Web - Note created on 03/18/2019 12:12:55 and created by Blake Miller
no miss fire detected and no codes of any kind are stored. So far the vehicle has stayed at 215 F After test drive at highway speeds. No leaks found. My concern is that this particular customer just had the engine replaced for an overheating concern and now has brought it back to the dealer. The customer has a picture of it showing on the dash that it is oveoverheating. should we check something more. this is the serv manager

1: Ok we suspect a head gasket leak on the odd side of the engine. If vehicle still has PT coverage do this
Please gain access to the head bolts closest to the area of the head gasket leak. Apply 45-50ft lbs of torque to them, see if the loosen or spin. If any do the threads in the cylinder block have stripped, will need short block replacement

*** 03/22/2019 13:30:35 ***

Web - Problem Description created on 03/14/2019 12:12:40 and created by Siebel eSupport
Customer states coolant leak present.

*** 03/14/2019 12:12:40 ***
Web - Diagnostics created on 03/14/2019 12:07:32 and created by Jose carnero
Vehicle came in with coolant leak. Previous dealer had replaced coolant thermostat housing. Pulled vehicle into shop and visual inspection verified and confirmed leak present. Performed coolant pressure test and revealed leak present at left bank cylinder head Removed valve cover gasket to reveal top right corner head bolt loose.

Possible overheating issue due to loss of coolant. Further inspection of block and head needed. Removed bank 2 head and performed warpage test with straight edge; test failed, warpage found. Ordered cylinder head and checked the loose head bolt threads to reveal the threads pulled from the block. Proceeded to replacing block. Took videos of headbolt loose in assembled engine.

Will provide pictures and videos along with WRTY engine core form for PWA authorization.

Thank you

1: The RO numbers are switched around a bit. TL case shows ending in 32 while PWA form ends in 23. Which one is correct?

*** 03/14/2019 12:58:46 ***
Web - Note created on 03/14/2019 12:58:46 and created by Jose carnero
58723 is correct. my apologies!

*** Web - Advice created on 03/14/2019 13:39:46 and created by Sam Camarillo ***
1: No worries easy correction on my end.

Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

Web - Problem Description created on 03/15/2019 05:38:25 and created by David Willey
Customer states the vehicle started to sputter, temperature went up, and the check engine light came on. Customer shut the vehicle off and had the vehicle towed in.

*** 03/15/2019 05:38:25 ***
Web - Diagnostics created on 03/15/2019 05:38:25 and created by David Willey
Checked for DTCs and could only find a C1503 TCS/ESC(ESP) Switch Error in the ESC system. Found coolant reservoir was full. Opened radiator cap and there was no coolant. You could see to the bottom of the radiator. Filled with coolant and started the vehicle. Coolant would not stop bubbling. Checked with block tester and block check fluid turned slightly yellow. Lifted the vehicle and found that Bank 2 side of engine had coolant residue coming from between cylinder head and block. Looks to have coolant leak between block and head towards the transmission end of the cylinder head. We've seen these have loose head bolts before so putting in for engine replacement.

1: David. We cannot approve a warranty just because some of these need it. Each one needs to be properly diagnosed. You need to pull the head bolts to see if any are pulling the threads from the block before opening a PWA for engine replacement. Otherwise, this would just need head gaskets which would be with DPSM approval not a Techline PWA. Thanks.

*** 03/15/2019 08:24:04 ***
Web - Note created on 03/15/2019 08:24:04 and created by David Willey
I tore the engine down and was able to remove 5 of the head bolts by hand. All 5 had stripped out threads in the holes and would not tighten back up. Attached pictures of head bolts and head bolt locations in the Bank 2 cylinder head.

1: Thank you for the information.
The head gasket will need replaced. But please see the information in line 2 upon disassembly.
2: : We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
3: If any of the bolts spin especially near the affected corner the block will need replaced. please attach pictures of the

stripped head bolts and the WRTY 143 form to the case. Please make sure the vehicle is under warranty and obtain approval to remove the cylinder head from your DPSM.

1: Charles,
Thank you for the information.
Please place the vehicle on the left then carefully inspect the bottom edge of the cylinder heads for any indication of a coolant leak.
Thank you

*** 03/07/2019 11:09:11 ***
Web - Note created on 03/07/2019 11:09:10 and created by Charles Swan
What does place vehicle on the left mean? Also, there are no visible leaks from cylinder heads.

*** Web - Advice created on 03/07/2019 11:42:16 and created by Jerry Gossling ***
1: Charles,
Raise the vehicle up in the air and look for coolant leaks coming from the head gasket area.

Thank you

*** 03/07/2019 11:49:37 ***
Web - Note created on 03/07/2019 11:49:36 and created by Charles Swan
As I have stated in my previous emails, there are no visible leaks.

*** Web - Advice created on 03/07/2019 11:59:54 and created by Jerry Gossling ***
1: Charles,
I know you stated there were no coolant leaks. But I have had leaking head gaskets cause this type of concern and the leak was not noticed until the Tech look from underneath the vehicle.

Please perform a cylinder leak down test per Technician basics TB009 with the radiator cap removed and see if coolant pushes back out of the fill neck.
Thank you

1: If the oil trail indicates that it may be from the rear oil cover plate, check the PCV valve, hose and baffle for blockage. The galleries protected by this plate are part of the PCV system and a small amount of oil present is normal. If the PCV system is blocked, excessive pressure in the gallery will result and the gallery being contaminated with an excessive amount of oil and result in leakage at the rear oil cover plate. Replace or repair blocked PCV components as necessary. If no problem is found, please replace the PCV valve (for an intermittent sticking issue), and the rear cover plate gasket. Please get as much of the excessive oil out of the gallery as possible.

*** 03/27/2019 09:33:37 ***
Web - Note created on 03/27/2019 09:33:37 and created by michael reagan
by the "rear oil cover plate" do you mean the plate that the oil pressure sending unit threads in to?

*** Web - Advice created on 03/27/2019 09:42:38 and created by Tony Thomas ***
1: The cover plate is on the rear of the engine block above the rear main seal and will sometimes appear that the rear main seal is leaking. To find the leak and be sure you locate the source, add oil dye to clean oil and run the engine until the dye is detected in the oil, then perform tear down to find where the source of the leak is.

*** 03/27/2019 10:42:20 ***
Web - Note created on 03/27/2019 10:42:20 and created by michael reagan
to me this doesnt appear to be a leak coming from the rear main the oil seems to start by the engine oil pressure sending unit plate and running down the channel created where the head meets the block i will be installing a new pcv and oil dye and see if that helps locate the source

*** Web - Advice created on 03/27/2019 10:46:51 and created by Tony Thomas ***
1: Thanks for the update. Let me know what you find.

*** Service Alert Escalated to CA as: 13103542 on 03/28/2019 01:05:11 (PST)

*** 04/02/2019 12:31:29 ***
Web - Note created on 04/02/2019 12:31:29 and created by michael reagan
finally found the leak the rear cylinder head bolt, right next to the oil supply orifice for the cvvt, threads pulled out of the block allowing loss of clamping pressure and the oil leak ordered the repair kit currently have the head off waiting for the kit sorry for the long response time i havent been able to concentrate on that vehicle much until yesterday and today

*** Web - Advice created on 04/02/2019 13:04:27 and created by Tony Thomas ***
1: What repair kit? Is this still under powertrain warranty?

*** 04/02/2019 13:12:09 ***
Web - Note created on 04/02/2019 13:12:09 and created by michael reagan
this vehicle is outside any factory warranties we have utilized a very nice kit for this concern in the past that comes with inserts, with a centering fixture tap and bit to bore the thread holes oversize and insert new threaded cylinders into the bigger hole it has worked well

*** Web - Advice created on 04/02/2019 13:17:46 and created by Tony Thomas ***
1: I understand. The Thread repair kits work very well. If it were warranty Kia would replace the engine though. Thanks for clarifying the warranty.

*** 04/02/2019 13:23:27 ***

C/s vehicle is overheating, no heat in vehicle.

*** 03/28/2019 07:27:47 ***
Web - Diagnostics created on 03/28/2019 07:24:19 and created by Robert Buxton
Filled system and pressure test, found small leak from center of thermostat control housing. After replacing housing, found no circulation in radiator. (Proper temp both sides of thermostat.)
Replaced radiator and bled system, working ok, road test ok.
70 mile later, engine steaming under hood: Found coolant spraying out of B2 head gasket onto front cat.

I've remove engine to replace head gasket and found threads from block stuck to head bolts. Photos attached

1: If the vehicle is still under factory powertrain warranty, Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel

pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

2: Your dealer is a DSA (A) status dealer and do not require PWA approval to replace the engine Long Block.

1: Thanks. We have reviewed your photos, and your DPSM's photos. If you have verified no signs of neglect, the engine has not sustained any external impact, it is not a used or junk yard motor, and the warranty is still valid according to Web DCS, please refer to warranty bulletin 2015-09 and attach the core data sheet WRTY143. It will need to be filled out, signed by both you and your service manager (no electronic signatures or stamps), dated and attached to this case. Be sure you are using the latest core data sheet, updated on 11-1-16.

PWA Case 13109564 created by Greg Phillips

*** Web - Advice created on 04/02/2019 07:07:10 and created by Greg Phillips ***

1: I have generated a PWA case, 13109564, for you. If this has valid warranty, please validate the vehicle warranty, in the new PWA case, so the PWA can be approved. Then please close this case and fill out the survey.

Based on the information you have provided, I recommend that you replace the engine following normal service procedures, after you validate the warranty in the new PWA case and receive approval. Replace the engine with a long block, if available, and follow PS539. If a long block is not available, then replace the short block and follow PS539 for Engine Component Re-use Guidelines. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

*** Web - Advice created on 03/28/2019 15:40:35 and created by Eric Patterson ***
1: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.
2: Then please perform a block check and add a short video or a clear picture of the fluid color after the color change please. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.

is this condition still covered under warranty because im not getting paid to perform these inspection

*** Web - Advice created on 04/03/2019 05:02:21 and created by Jerry Gossling ***
1: Jose,
When you open a PWA case you are asked to validate the warranty to ensure the vehicle is still covered. If you are not sure the if the vehicle is covered under warranty you need to have the service advisor check to see if the vehicle still has drive train

warranty.

If you are not sure your going to be paid for these test you need to request prior authorization from your DPSM before performing the test. This is something I would personally do when I still worked in the field.
Thank you

*** 04/03/2019 08:30:06 ***

1: You have validated the warranty and the completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083. Thank you,

customer reports vehicle overheated while driving ticking noise from engine

*** 01/29/2019 10:21:36 ***
Web - Diagnostics created on 01/29/2019 10:21:36 and created by Anatoliy Pishenin
confirmed customer concern, vehicle had no coolant in reservoir and when started vehicle could smell coolant coming from exhaust. upon further inspection found front cover and bank 1 headgasket have coolant seaping. when engine starter could hear light rod knock but very faint.
performed leak down test on cyl 1 85% and could hear whistling coming out of the coolant radiator fill point. coolant inside looks very mercy(contaminated with oil)
when checked the waterpump pulley was able to wiggle it around significantly more then it should be.
please see picture of front cover.
please advise on how to proceed next.
Reccomend head gaskets and water pump and tear apart tear apart make sure heads not cracked? or perform short block also?

1: Anatoliy hello

There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts,

Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced Please report your findings

*** Case has been auto closed by the system on 03/01/2019 01:09:26 (PST)

1: Need to remove cylinder heads and measure the block and head surface flatness with a precision straight edge and a filler gauge.

*** 05/10/2019 08:19:19 ***
Web - Note created on 05/10/2019 08:19:19 and created by Ted Williams
confused.....if the head gasket is blown to where the coolant comes out the rear as seen in video and i take the block test as requested along with spinning the head bolts which clearly shows there stripped and she has every oil change record since purchase and i sent a video of the front valve train to verify. then we have more than enough for a PWA. i have alot more work than just this one vehicle and cannot tie up a bay for the next 2wks then have to wait for a motor for another week or 2 to 3. ..this isnt typical protocol and isnt warranted i gave enough legitimate proof already.

*** Web - Advice created on 05/10/2019 09:32:22 and created by Mike Ozonur ***
1: remove the cylinder heads and attach a picture of the head bolts showing the stripped threads and measure the cylinder head surface for flatness and check see if they are reusable

1: Hello Michael
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond speciation's Please report your findings

1: I am glad I was able to help
I have generated a PWA case for you; please validate the vehicle warranty so the PWA can be approved
Based on the information you have provided, I recommend that you replace the engine following normal service procedures.
Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

*** Web - Advice created on 04/18/2019 09:35:10 and created by Frank Lusic ***
1: Hello Milton
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** Web - Advice created on 04/18/2019 09:44:47 and created by Michael Goldwasser ***
1: Milt called in to discuss this case. Advised him to get another video of the engine knock from the oil pan with the radiator cap on and attach it to this case for review.

1: Thank you
If you have not done so already, Please remove the valve cover and take a VIDEO of the COMPLETE valve train area that includes the VIN then attach it to this case . Then add a case note so I will be made aware that they are there.
ONLY IF THERE IS ANY INDICATION that there is lack of maintenance (oil jell) in the engine then,
Please obtain the service records from the customer, Then attach them to the case and add a case note to the file so I will be made aware that they are there, Thank you

1: The completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.
You will NOT be using a QQK part number
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.
Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin All Others

*** Web - Advice created on 04/20/2019 12:50:01 and created by Eric Patterson ***
1: Please add a video showing the head gaskets leaking.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

Web - Note created on 04/23/2019 08:16:28 and created by Ryan Young
the vehicle was inspected about 100 miles ago for a leaking fluid. it was found to be a coolant leak, and coolant leaks were found in the thermostat assembly from the coolant temp sensor and heater hoses, coolant leaking from radiator. customer also stated that the temperature gauge was very high. customer declined to perform repairs with the dealer and had repairs performed at another shop. after repairs were performed by other shop customer says a noise was present in the the engine area under acceleration.

*** 04/23/2019 10:03:49 ***
Web - Note created on 04/23/2019 10:03:49 and created by Ryan Young
vehicle does not appear to have been in a frontal collision

*** Phone - Advice created on 04/23/2019 11:56:17 and created by Eric Patterson ***
1: Another shop performed some of the repairs and used silicone.

No accident damage found.

Basically since the overheating happened before the other shop repaired the vehicle we will look at the head gaskets themselves. Please look under the vehicle and see if you see leaks from the gaskets.

Please add pictures of the leaks to the case.
2: Then we will need customer to authorize the removal of the valve cover gaskets for the maintenance inspection and the torqueing of the head bolts. Please try and torque them to 80ft lbs, if they spin near the coolant leak please add a picture to the case of the stripped threads on the block.

*** 04/23/2019 17:25:04 ***

*** Web - Advice created on 04/16/2019 06:42:32 and created by Eric Patterson ***
1: Thank you for the information.

Thank you for the information. The mileage and the yr of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
3: Please start around cylinder #3. If the bolt does strip out please add a picture of the threads of the head bolts to the case. Thank you. At that point the block will need replaced. Then the heads will need inspected for warpage.

1: engine has overheated and based on the picture of the block tester there are exhaust gases in the cooling system, we will have to remove the cylinder heads anyway to measure the surface flatness of the block and the cylinder heads, we are just trying to determine if a long block or cylinder heads or short block will be replaced for that reason we do ask that you torque the head bolts to 80ftlbs see if they spin or they tighten,
2: if the head bolts spin and strips the threads we would ask that you attach a picture of the stripped head bolts to the case, thanks Owen,

*** 05/19/2019 10:57:41 ***

1: Thank you for the attachments to the case.

2: B: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

*** 05/02/2019 06:41:53 ***
Web - Note created on 05/02/2019 06:41:53 and created by PABLO RAMOS
THERE IS NO METAL DEBRIS IN OCV
HEAD BOLTS WHEN TRYING TO TIGHTEN PULLED THE THREAD. THE BOLTS THEM SELF'S WERE LOOSE,.

*** Web - Advice created on 05/02/2019 09:56:52 and created by Eric Patterson ***
1: Perfect. Thank you. Please remove the cylinder heads and add pictures of the bolts with the stripped threads from the block.
2: The engine will need replaced. If the heads are warped they will need replaced. If they are within specs after the inspection with the strait edge please replaced the block with a reman block and send the heads out for inspection. Or if there is a long block available please use the long block reman engine.(if the heads were warped)
3: Please attach the completed and signed WRTY143 [Rev. 11/1/2016] core data form to THIS case. Then I will create and or approve the case for you. Please see PS561 for the fields required on the form that need filled out for the approval.

Web - Problem Description created on 05/13/2019 07:11:01 and created by Joshua Keown
Engine is making some abnormal noise and overheating I have found that the rear head is leaking at the head gasket down to the bottom of the engine block and the vehicle was low on coolant and making more noise while it was low. I had to add a half a gallon of coolant to the system to make it full. I did a pressure test and the pressure was dropping consistently from 15 psi down and one of the pictures shows a 10 mm bolt that is wet do to the leaking head gasket while under pressure, the Integrity of the engine from overheating and having some noise I believe is compromised and recommending replacement of a long block please advise. I have added pictures and a video

veh overheated and coolant smell

*** 05/14/2019 10:14:38 ***
Web - Diagnostics created on 05/14/2019 10:14:38 and created by Shane Johnson
verified concern, coolant coming out of overflow tank vent. test system, found coolant very low. when starting vehicle with pressure tester installed the pressure goes up instantly, suspect blown head gaskets. external inspection revealed leaking at front and rear head gaskets. suspect threads have pulled out causing loss of clamping on head gaskets. please advise course of action to take (attempt to tighten headbolts, etc.) thanks for your time! (attaching photos of leaks at head gaskets front and rear)

1: Shane,
Please, contact your DPSM for approval to disassemble the engine for inspection of the block and cylinder head surface with a machinist straight edge. Thank you.

*** 05/14/2019 10:22:24 ***

Web - Note created on 05/14/2019 10:22:24 and created by Shane Johnson
Last time this happened techline had me see if I could torque the head bolts due to the block thread issue I have seen multiple times. Should we try that first? If they can't hold torque it would require engine replacement.

*** Web - Advice created on 05/14/2019 10:25:20 and created by Douglass McKay ***
2: When disassembling the heads apply torque to the head bolts to check for threads pulled, please attach a video if you find the threads pulled, Thank you.

Web - Problem Description created on 05/15/2019 09:37:47 and created by Andy Smith
vehicle is loosing coolant excessively with no leaks. vehicle has overheated.

*** 05/15/2019 10:08:27 ***
Web - Diagnostics created on 05/15/2019 09:37:47 and created by Andy Smith
inspected the vehicle for coolant leaks and found none. the thermostat and t-stat housing was replaced the last time the vehicle was in the shop due to the t-stat sticking open. inspected the previous repair for any leaks or damage and found no issues. noticed when i removed the radiator cap that there was a burst of pressure that came out and the coolant was low. hooked up coolant pressure tester and pressurized the system to 15 psi and checked at 15 minutes with no movement on the gauge. performed block check and found no issues.when topping coolant off with my coolant funnel and any time the engine was revved the funnel would bubble and gurgle. also the coolant smelled like exhaust. hooked up my coolant pressure tester and when the engine revved the the pressure would raise substantially from 0 psi all the way to 15 psi when i stopped checking. verified that the fans were operating normally as well. i believe the vehicle needs headgaskets.

Web - Note created on 08/07/2019 16:39:25 and created by FRANCIS LE
I removed the engine from the vehicle and performed tear down. Check torque specs on the both cylinder head. Specification for first pass is 27.5-30.4 ftlb and I set the torque wrench to 30 ftlb. Found some of the head bolts were loose and some will not reach 30 ftlb. Checked head surface and found that Right hand cylinder head is warped measuring at .003 inch with a feeling gauge and straight edge. I have attached a video of me re-checking torque on the cylinder head.

*** Web - Advice created on 08/08/2019 08:00:18 and created by Douglas McKay ***
1: Jeffrey,
I can see in your video that you have found stripped or pulled cylinder block threads, you will need to replace the short block and one cylinder head.

PWA Case 13183232 created by Sam Camarillo

*** Web - Advice created on 05/21/2019 07:30:23 and created by Sam Camarillo ***
1: Thanks much, I will create a PWA for you.
I have generated a PWA case for you; please validate the vehicle warranty so the PWA can be approved .Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

C/S the engine is leaking coolant and smells something burning.

*** 05/23/2019 11:58:06 ***
Web - Diagnostics created on 05/23/2019 11:54:37 and created by Greg Nelson
Hello, have verified condition present, the burning smell is the coolant hitting the exhaust from a leak at the head gasket area from the rear of bank 2. Have attached a picture for review. This will be a first for me, usually they are already damaged more and need an engine. Reporting due to tear down needed and I'm sure our DPSM will ask if I have this in place before giving PWA auth. for tear down. Thank you, please let me know what else you might need.

Engine oil leak.

*** 05/16/2019 14:44:35 ***
Web - Diagnostics created on 05/16/2019 14:43:32 and created by Kyle Marchi
Confirmed oil leak. Pooling around both front and rear of transmission. Traced oil leak to block valley. Oil pressure switch leaking oil past connector. Replaced. Oil leak still present. Suspected pressure switch housing seal failure. Replaced gasket for switch housing Leak still present. Oil always pooling around bank 1 interior corner by timing cover. Suspected oil leaking past timing cover inner silicone seal. Completed resealing of front timing cover. Oil leak still present. Installed oil dye and sprayed valley with SPOTCHECK developer spray. Ran vehicle for 10 seconds. Removed upper intake manifold for inspection. If lower intake manifold is removed coolant leaks out and ruins inspection process. Using boroscope/endoscope found engine oil at bank 1 head gasket around cylinder 1 and 3. Oil leak repairs have been attempted prior to 100k miles. Vehicle now over 100k miles. Please advise.

1: Damian, your dealer is DSA self authorizing so a PWA case is not necessary or required for engine replacement.
If you are no longer DSA, attach a video of the VIN a the head bolts showing the thread damage.
A photo of the valve train showing the engine was maintained.

customer states engine miss on cold start see previous tech case.

*** 06/04/2019 11:46:14 ***
Web - Diagnostics created on 06/04/2019 11:43:22 and created by Eric Depoy
replaced injectors per previous case. after vehicle sat in shop noticed a small bit of coolant on ground after tech pulled vehicle out. Pulled vehicle back into bay and performed a coolant pressure test and found coolant coming from back cylinder head between engine block and head this vehicle has 2000 miles and has been down for for several days. do we want to go with normal repair procedure for cylinder head repair or possible engine replacement being such low mileage. This customer had a 17 sportage that was part of the pi1802 that was down for over 5 months and ended up trading for this vehicle.

1: Konstantin,
Thank you for the video.

*** Web - Advice created on 06/11/2019 15:56:52 and created by Douglas McKay ***
1: Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

*** 06/11/2019 06:00:18 ***
Web - Note created on 06/11/2019 06:00:18 and created by Matthew Peachey
Leak down test: 1: 8%, 2: 5%, 3: 18%, 4: 4%, 5:14%, 6: 4%
No problems found at all on front left bank, bank 2, cylinder 3 on leak down pressurized coolant system heavily and leaked out radiator
Upon tear down found no reason to remove front head as all head bolts were tight and the bank 1 head the corners were very much so tighter than the center head bolts and everything torqued in without stripping. But at cylinders 3 and 5 the head bolts were loose like they had stretched from over heating, used machining guide and found no more than .0010-.0015 warp at any point all within spec. Pictures and videos to follow. I did not remove the front head since there were no issues with the leak down or running concerns related and all head bolts were still torqued. Engine ran fine just began heating up more and more as it ran.

There is coolant in cylinder 3 with tiny amounts of rust scale building at top of cylinder liner but removes easily with oil and Emory cloth.
Pictures and videos to follow.
Torque wrench videos have a 1/2” drive snap on gen 2 digital torque wrench set to 60 ft-lbs

1: hello Darniel
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** 06/20/2019 13:06:14 ***
Web - Note created on 06/20/2019 13:06:14 and created by Daniel Vargas
REMOVED CAMS ON BANK 1(FIREWALL SIDE) AND DID HAVE 1 HEAD BOLT LOOSE AND IT JUST KEPT SPINNING.

WOULD NOT TORQUE PASS 35FT LBS

1: Thank you for the video, I see the exhaust gasses in the cooling system. Thank you.
2: Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.
3: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 45 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

*** Service Alert Escalated to CA as: 13240340 on 06/27/2019 01:06:50 (PST)

*** 07/02/2019 07:07:17 ***
Web - Note created on 07/02/2019 07:07:17 and created by Pete Sustaita
results of torque check were as follows. bank 1 cylinder head had 2 bolts break loose and spin freely at 45 ft-lbs. Bank 2 had 3 bolts break loose at 45 ft-lbs. all bolts that broke free
were all toward the transmission mounting side of the engine.

*** Web - Advice created on 07/02/2019 08:30:02 and created by Eric Patterson ***
1: Thank you for the inspection results.

The heads will need removed and inspected for warpage.

If they are warped I would recommend a long block, if not please send them out for pressure checking and a valve job.
Please obtain approval from the DPSM to remove the heads for I inspection.
2: The block will need replaced based on the threads are compromised to hold the cylinder heads down to proper torque.
3: Please let me know if the heads will need replaced. Please also add the WRTY 143 form to the case for the block approval.
Thanks Pete.

*** Web - Advice created on 07/02/2019 08:30:53 and created by Eric Patterson ***
1: Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.
2: I see the vehicle is 9 miles over the 60 K. please double check and make sure the engine has valid powertrain.

1: Thank you Kosta
Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines
2: is the customer the original owner of the vehicle
3: if the vehicle has powertrain warranty Before I can give approval I need you to please complete, sign and attach the REVISED WRTY143 Core Data Form to this case to proceed. The form must have the RO#, mileage, date, VIN and be signed by technician and service manager. Please add a note to the case once the form has been attached. Thanks.

PWA Case created for RA Case 13166301 by Brian Lall

*** Web - Advice created on 06/27/2019 04:53:14 and created by Brian Lall ***
1: I have generated a PWA case for you; please validate the vehicle warranty so the PWA can be approved
Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

*** 06/27/2019 08:34:24 ***
You have validated the warranty and the completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures.Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

Web - Note created on 07/01/2019 08:24:32 and created by Blongkou Xiong
if a long block is not available, how should we go about replacements?

*** Web - Advice created on 07/01/2019 09:20:24 and created by Sam Camarillo ***
1: I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use

*** 07/01/2019 10:39:13 ***
Web - Note created on 07/01/2019 10:39:12 and created by Blongkou Xiong
long block is discontinue. how do we determine if the heads are bad?

*** Web - Advice created on 07/01/2019 11:00:00 and created by Sam Camarillo ***
1: Do the checks shown in shop manual, if you are not able to do that send them out to a qualified machine shop.

*** Service Alert Escalated to CA as: 13246454 on 07/02/2019 01:06:34 (PST)

*** 07/05/2019 13:05:36 ***
Web - Note created on 07/05/2019 13:05:36 and created by Blongkou Xiong
inspected cylinder head flatness and reading from LH cylinder head is 0.051mm(.002in). and for RH cylinder head is .038mm(.0015in). what advice you think i should do next with the head?

*** Web - Advice created on 07/05/2019 14:01:19 and created by Tony Thomas ***
1: The heads are very close to minimum specification Less than 0.05mm (0.0019in.). Clean the surface and recheck. Replacement of any related components needed in addition to consequential damage from engine failure should be covered using a separate claim under a new line using the same Repair Order. Additional time for extraordinary circumstances is allowed and should be claimed following normal service policy procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines for ALL scenarios "Damaged parts as needed". Thank you.

*** 07/08/2019 04:21:49 ***

1: Please, contact your DPSM for approval to disassemble the engine for inspection of the block and cylinder head surface with a machinist straight edge. Thank you.
2: When removing the cylinder heads check the torque on the head bolts before removing to check for stripped or pulling threads, please take a video of this process for review. Thank you.

*** 07/09/2019 08:31:57 ***
Web - Note created on 07/09/2019 08:31:57 and created by Jason Fitzgerald
pulled rear valve cover and checked head bolts, 5 of the 8 are rock solid and 3 are somewhat loose. bolts on lower part of head between cyl 1 and 3 do not seem to be quite correct. the rest of the bolts are nice and solid in the block but it seems like the 3 i found to be slightly loose are not nearly as solid.

*** Web - Advice created on 07/09/2019 13:08:12 and created by Douglas McKay ***
1: Jason, if you are having trouble attaching files or videos like I requested, your will need to clear the cache in your tablet to download the files, please use this procedure.

To clear Chrome browser Cache, browsing history, cookies, site data, save passwords, autofill data on any Android phone or tablet, follow these steps:
1. Open Chrome
2. Go to Setting
3. Tap on Privacy
4. find "Clear Browsing Data" on the bottom of the page and tap on it
5. Check the Data you would like to clear

2: I also need you to please complete, sign and attach the WRTY143 Core Data Form dated 11/1/16 as outlined in Pit stop PS410 to this case to proceed. The form must have the RO#, mileage, date, VIN and be signed by technician and service manager.

1: Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

*** Web - Advice created on 06/18/2019 05:33:32 and created by Brian Lall ***
1: Thanks for letting me know what you found. I know you stated there was bubbling from the reservoir for 40 mins but the engine past a block check. Did you bleed the air out of the system or fill the cooling system by putting it in a vacuum? Did the engine overheat during that time you were testing, and did the cooling fans turn on? Did you pressure test the complete system or just the radiator cap?

*** 06/18/2019 10:34:55 ***
Web - Note created on 06/18/2019 10:34:55 and created by Pedro Orellana

I did pressure tested the cooling system, no leak found, I installed a spill-free funnel to add coolant and let the engine running for 40 minutes and let the air come out the engine, that when I mention is was bubbling through the reservoir actually it was on the funnel container, then I installed the radiator cap and road tested, that when pressure built up and pass through the radiator cap to OEM reservoir and over filled, engine did not over heated on me, I actuation test the condition of the radiator fan, test PASS.advice.

*** Web - Advice created on 06/21/2019 04:49:27 and created by Brian Lall ***
1: Please perform a block test and check to make sure the thermostat is opening and the hoses temps are even after the engine is at operating temp. Let me know what you find. Thanks.

*** 06/24/2019 12:16:15 ***
Web - Note created on 06/24/2019 12:16:15 and created by Pedro Orellana
thermostat is operating normal, block test pass, advice.

*** Web - Advice created on 06/26/2019 04:36:58 and created by Brian Lall ***
1: Is there still air bubbles coming out after the vehicle got up to operating temp and the thermostat opened?

*** 06/27/2019 10:25:12 ***
Web - Note created on 06/27/2019 10:25:11 and created by Pedro Orellana
yes still bubbling air after thermostat opened.

*** Web - Advice created on 06/28/2019 07:30:27 and created by Brian Lall ***
1: When you did the block test did you wait for the engine to get to operating temp with the thermostat open? Are you sure the fluid is good that you are using in the tester?

*** 07/01/2019 11:42:21 ***
Web - Note created on 07/01/2019 11:42:21 and created by Pedro Orellana
yes the engine was at operating temp with thermostat open, the fluid that i using is good on the tester, FYI on the last 5 engines v6 that I diagnosed this year, for overheating concern, all 5 pass the block test but when I tear down the engines I found the cylinder head main bolts were loose due to the thread on the short block came out with it, that happens on all 5 engines, what do you think about this vehicle?

*** Web - Advice created on 07/02/2019 11:00:43 and created by Brian Lall ***
1: The symptoms are like a blown head gasket. Is it possible the fluid you used is no longer good. You can verify by putting some of the fluid in the tester and starting any vehicle then putting the tester in the tail pipe and checking if the fluid changes color. For this vehicle if the bubbling in the cooling system continues, please do a cylinder leak down test on all cylinders and note the % of leakage and where the air is escaping during the test. Thanks.

*** 07/09/2019 16:58:03 ***
Web - Note created on 07/09/2019 16:58:02 and created by Pedro Orellana
I performed leak down test on all cylinders, result cylinder #3 and #2 leaking more than 60%, I could not tell through were, maybe cooling system and because the engine is cold is was not obvious, not through intake,exhaust or crankcase, the other cylinders were 10% or less.

*** Web - Advice created on 07/10/2019 07:36:10 and created by Brian Lall ***
1: Please remove the spark plugs and inspect cylinders 2 and 3 with a bore scope and note if you find any fluids, any damage to the pistons, or damage or scoring to the cylinders. Let me know what you find. Thanks.

*** 07/11/2019 12:02:27 ***
Web - Note created on 07/11/2019 12:02:27 and created by Pedro Orellana
I performed the inspection using a bore scope, cylinder number two have a signs of coolant on combustion chamber, scoring walls are present but I can not tell if is normal or damage, number three also have signs of water on combustion chamber plus the top of the piston have sign of heavy explosion and damage the piston.

*** Web - Advice created on 07/12/2019 09:14:01 and created by Brian Lall ***
1: Please attach the WRTY 143 form to the case and make sure it is filled out as per PS 561. Thanks.

*** Web - Advice created on 07/18/2019 16:21:04 and created by Jesse Lancaster ***
1: I have generated a PWA case for you; please validate the vehicle warranty so the PWA can be approved
Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

2: • Replace the engine with a long block, if available; otherwise, please order a short block assembly
•If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect the original cylinder head thoroughly to determine whether head replacement is required
•If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
•Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.
•If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan od engine), do not use the original intake manifold; replace the intake manifold with a NEW one.
The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.
• Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.
Thank you

*** Web - Advice created on 07/15/2019 12:28:51 and created by Eric Patterson ***
1: Thank you for the attachments to the case.

2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 45 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

*** 07/16/2019 16:25:42 ***
Web - Note created on 07/16/2019 16:25:42 and created by Cam Ly
Remove engine & tear down to inspect & found b1 cylinder head bolts loosened. recheck cylinder bolts @ b2 and found 2 head bolts not tight also. Possible cylinder head warped. Slight metal shavings on ocv

*** Web - Advice created on 07/17/2019 08:03:00 and created by Eric Patterson ***
1: Thank you please add pictures of the metal and the stripped threads and the PWA WRTY 143 form to the case for the PWA approval case. TY Cam
2: Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.
3: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

*** 07/23/2019 07:43:24 ***
Web - Note created on 07/23/2019 07:43:24 and created by Cam Ly
Heads pressure check okay and are not warped. We have replaced the seals and checked the guides and they check okay. Are we to replace short block and reuse these heads?

*** Web - Advice created on 07/23/2019 10:26:44 and created by Eric Patterson ***
1: Please add the engine PWA form to the case, Then I will create the PWA case for you. Then you will need to replace the short block and re use the heads.

can not get small enough tappets for head

*** 10/02/2018 12:18:15 ***
Web - Diagnostics created on 10/02/2018 12:18:15 and created by Cole Beckett
i am building heads for this car and i can not adjust the valves to spec. all of the intake valves are to tight on the left head. i need smaller tappets then a 3.00 but they are not available through parts.

*** 10/02/2018 13:19:25 ***
Accepted, from Queue = TL_Sorento_Sportage to WIPBin Default

*** Web - Advice created on 10/02/2018 13:21:02 and created by Eric Patterson ***
1: Is the cylinder head new? Or rebuilding the original head? If this is a new head compare to the other cylinder head, are the valves sitting too high?

*** 10/02/2018 13:28:22 ***
Web - Note created on 10/02/2018 13:28:21 and created by Cole Beckett
new head. the valves seem to be sitting fine

*** Web - Advice created on 10/02/2018 15:34:14 and created by Eric Patterson ***
1: Is the cam new? If so please try the old cam, is the clearance the same?

*** Service Alert Escalated to CA as: 12890852 on 10/03/2018 01:04:50 (PST)

*** 10/03/2018 04:59:19 ***
Web - Note created on 10/03/2018 04:59:18 and created by Cole Beckett
no it is the original cam

*** Web - Advice created on 10/03/2018 07:47:54 and created by Eric Patterson ***
1: Are the seats in the head on the intake side?
Do they look pressed in farther than normal?
Are you reusing the valves? Are they new?

2: What's the smallest clearance you have and what's the measurement of the tappet for that clearance?

*** 10/03/2018 08:04:04 ***
Web - Note created on 10/03/2018 08:04:04 and created by Cole Beckett
they are the old valves they look to be seated fine. i swapped everything back to the old head and the clearance in within spec. my smallest clearance is .003 in with a 300 tappet also have a .004 with a 285 tappet. all of the intake valves are to tight the exhaust is ok on that head but on the right head i have a exhaust valve this is tight it is .009 with a 405

*** Web - Advice created on 10/03/2018 08:52:58 and created by Eric Patterson ***
1: Looks like there is a possible issue with the head, the heads may have to go to the machine shop for the valves to be grinded for proper fitment.
2: I will return after having the Techline lead review the information as well.

*** 10/03/2018 12:31:51 ***
Web - Note created on 10/03/2018 12:31:51 and created by Cole Beckett
do i need to send the heads out for valve adjustment?

*** Web - Advice created on 10/03/2018 13:10:26 and created by Eric Patterson ***
1: Yes I would. After review of the information, I see you do have a shim under the .300. Please have parts call Mobis and see if they do have smaller shims, otherwise the stems may need cut down to resolve the clearance issue. Please give the machine shops the specs when sending the head.
2: If the smaller buckets are available then use them.

*** 10/09/2018 07:55:58 ***
Web - Note created on 10/09/2018 07:55:58 and created by Cole Beckett
i sent the heads out and got them back they are within spec now. Also i have a question do you need a pwa for head replacement when you are doing a short block if the are damaged?

*** Web - Advice created on 10/09/2018 09:26:38 and created by Eric Patterson ***
1: No sir. You will need DPSM approval for the head replacement. Just explain the reasoning why the cylinder head needs replaced. That's it.

*** Phone - Advice created on 10/09/2018 10:35:25 and created by Steven Okimura ***
1: Service manager called questioning if DPSM approval is required to replace the heads. Advised they do not and to refer to PS539 which states "If the part condition is determined not to be serviceable, then a detailed description of the exact defect per part replaced, along with supporting measurements where applicable, are required to be documented on the repair order and in the claim notes to explain why the part could not be thoroughly cleaned and transferred to the new engine."

2: This case states they 'sent the heads out and got them back they are within spec now' he will speak with the tech to verify if the heads require replacement or not.

*** 10/10/2018 06:14:46 ***
Web - Note created on 10/10/2018 06:14:45 and created by Cole Beckett
i ran into another issue. when i was installing the heads on the new block i found a head bolt hole in the block is stripped out. i was on the second sequence of the torquing procedure when this occurred.

*** Web - Advice created on 10/10/2018 07:50:58 and created by Eric Patterson ***
1: Please add the pictures of the stripped out hole to the case. Then add a WRTY 143 form to the case. The block will need

replaced.
2: Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.

*** 10/10/2018 08:28:07 ***
Web - Note created on 10/10/2018 08:28:07 and created by Cole Beckett
i will shortly, but to make you aware this is a new block that was approved on a previous case for this vehicle due to stripped head bolts and blown head gaskets.

*** Web - Advice created on 10/10/2018 09:32:52 and created by Eric Patterson ***
1: If the engine was not installed on the vehicle please parts warranty the block. Thank you for the updated information.

1: Joe,
Thank you for the information. I would like to know if this vehicle is still under power train warranty.

Next I recommend to gain access to bank one head bolts and see if they will maintain a 65 foot pounds of torque by using a torque wrench.
Thank you

*** 07/26/2019 13:02:18 ***

1: TY for the update to the case.
+
Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.

Please and make sure the vehicle has powertrain warranty. 1st owner up to 100,000 miles and 10 years . 2nd owner up to 60,000 miles 5 years of original sales date.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 45 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

sorry for taking so long to get back to you ,but I just gone some time because I and the only one doing engines were a very small shop and I have more towed in ... I removed cover and cams tried torqueing head bolts on ft. head and 3 just spin around threads in block pulled out ..this needs a block replacement thank you for your help... also I hope it comes in befor july because I will be 66 and retiring.... not saying there is a long wait for engines ////

*** Web - Advice created on 08/15/2019 07:29:26 and created by Chris Schang ***
1: Thanks Jeffrey,
The engine will need replaced. If the heads are warped they will need replaced. If they are within specs after the inspection with the strait edge please replaced the block with a reman block and send the heads out for inspection. Or if there is a long block available please use the long block reman engine. Please attach a photo of the valve train as best you can considering its been removed and attach the core data form. Since we have some new software and its a bit touchy, you may have to open a new PWA case on your end that I can go into and approve.

customer states engine is over heating.

*** 08/07/2019 06:49:24 ***
Web - Diagnostics created on 08/07/2019 06:44:49 and created by Nicholas Panetti
confirmed vehicle overheating on heavy acceleration. pressure tested, slowly loosing pressure. preformed block test, found exhaust gases escaping. removed upper and lower intakes, was able to pinpoint where head gasket was leaking.(pictures attached). I am aware that the head bolts tend to strip out. I attempted to torque head bolts, bolts around effected area did not torque and pulled out threads. I then removed cylinder heads to check for warpage, head's are ok no warpage. There is only a short block available. At this point i would like to replace cylinder block, head gaskets and head bolts.

1: Why replace the cylinder head if there is no warpage? I would thoroughly check that head, not just for warpage, but if there is no damage, It shouldn't be necessary to replace it. If you do not find any actual damage to the head, you would have to run

it by your DPSM and see if he wants to replace it. Please add a photo of the valve train to the case.

*** 08/07/2019 09:46:53 ***
Web - Note created on 08/07/2019 09:46:53 and created by Nicholas Panetti
as i noted cylinder head has no warpage or damage, i am only trying to get authorization for cylinder block, gaskets and bolts.

1: Based on the information you have provided, you are authorized to replace the engine. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Replace the engine with a long block, if available, and follow PS539. If a long block is not available, then replace the short block and follow PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

Customer states there is a possible coolant leak and the vehicle would not accelerate when driving at freeway speeds and then started to run rough.

*** 08/08/2019 14:48:18 ***
Web - Diagnostics created on 08/08/2019 14:48:18 and created by FRANCIS LE
I removed the engine from the vehicle and performed tear down. Check torque specs on the both cylinder head. Specification for first pass is 27.5-30.4 ftlb and I set the torque wrench to 30 ftlb. Found some of the head bolts were loose and some will not reach 30 ftlb. Checked head surface and found that Right hand cylinder head is warped measuring at .003 inch with a feeling gauge and straight edge. A case was open #13182302 and I was advised to close the case an open a PWA. I have attached a PWA form to this case

Customer was complaining about the cooling fan running after shutting engine off.

*** 08/21/2019 14:00:03 ***
Web - Diagnostics created on 08/21/2019 14:00:03 and created by Dan Beaird
Another tech diagnosed that it was leaking coolant at the left head gasket near cylinder #2 causing it to run hot.

I got the vehicle to do the repair and during tear down I found two head bolts loose indicating the threads are pulled out in the block, it is the two bolts on both sides of bank 2 exhaust port. The only reason I found this before I pulled the head is that I've had one do this before so I checked them before pulling the cams and the heads wiggle.

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin default

*** Web - Advice created on 08/20/2019 14:19:50 and created by Frank Lusic ***
1: Hello Erwin
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold,

then if these are okay then replace the cylinder head

*** 08/26/2019 14:06:40 ***
Web - Note created on 08/26/2019 14:06:40 and created by Erwin Dale
disassembled engine to check head bolt torque
by the chart in kgis head bolts 1 4 5 were loose compared to the rest
re-torqued the head bolts in proper order found 1 5 are stripped out of the block

*** Web - Advice created on 08/26/2019 14:27:06 and created by Frank Lusic ***

Customer state engine over heating and engine light on

*** 08/19/2019 09:23:10 ***
Web - Diagnostics created on 08/19/2019 09:19:55 and created by Farzad Makarehchi
This vehicle has been in several time for the same issue .
when first start noticed a slight engine miss and DTC is set as p0300, P0310, p0303
Up on inspection found the coolant is low .
Top off coolant and bring the engine to operating temperature . at this time water is circulating as upper and lower hose are hot .
max observed temperature 212 deg , fan at 35%
no misfire recorded.
the pressure cap is new and tested , the thermostat was replaced and previous visit with pressure cap.
noticed the coolant overflow tank emits bubbles from the radiator indicating combustion in the cooling system .

thread pulled at 53 ft pounds of torque

*** Web - Advice created on 09/10/2019 14:40:20 and created by Mike Ozonur ***
1: tech called in and states the head bolts are stripped and added picture to the case, also measured cylinder head for flatness and found them to be warped over 0.03
2: advised tech Based on information you provided engine has to be replaced. Recommend that you Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.
3: For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083

*** 07/29/2019 11:14:58 ***
Web - Problem Description created on 07/29/2019 11:03:24 and created by Adrian Records
Customer states A/C blows warm.

*** 07/29/2019 11:14:58 ***
Web - Diagnostics created on 07/29/2019 11:03:24 and created by Adrian Records
I tested A/C system and found that the A/C blows cold initially, then blows warm once engine operating temperature is achieved. Upon visual inspection, I noted that the coolant reservoir was depleted. I also found the radiator was filled only to approximately half capacity. Upon further inspection I found coolant residue around the front exhaust manifold where the manifold bolts to the cylinder head. This coolant trail in no way appeared to connect the plastic coolant distribution block on the side of the engine. The radiator fan operates normally. I replenished the cooling system with a burp funnel and started the engine. When applying throttle, there is a considerable surge of coolant into the burp funnel, and when allowed to run at length, the engine to consumes a non trivial amount of coolant. I suspect at least one of the head gaskets is blown. With sufficient coolant in the system, the A/C seems to operate indefinitely.

*** 07/29/2019 12:37:13 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin defaults

*** Web - Advice created on 07/29/2019 12:39:30 and created by Sam Camarillo ***
1: Please gain access to the head bolts closest to the area of the head gasket leak. Apply 45-50ft lbs of torque to them, see if the loosen or spin. If any do the threads in the cylinder block have stripped, will need short block replacement

*** 07/30/2019 06:32:39 ***
Web - Note created on 07/30/2019 06:32:39 and created by Adrian Records
Upon closer inspection, it appears as though the coolant residue originates from the exhaust manifold itself, specifically the studs to which the manifold is attached. The residue seems concentrated around the studs, spreading from there. There is even coolant residue present around the upper most studs. Perhaps this is an indication of an issue with the head itself? I've

included pictures for clarity.

*** Web - Advice created on 07/30/2019 06:39:33 and created by Sam Camarillo ***
1: I have seen that but not a very common issue. I would remove the exhaust manifolds and pressurize to verify if it is from studs or coming out of the ports.

*** 07/30/2019 10:22:19 ***
Web - Note created on 07/30/2019 10:22:19 and created by Adrian Records
I have removed the exhaust manifold, removed the coolant residue, and attempted to pressure test the cooling system. After 10 minutes have elapsed, the cooling system pressure has not lowered, nor have any active leaks made themselves apparent. I suspect the leak is only present when the engine is at operating temperature. I have included more pictures showing the distribution of coolant residue along the head and exhaust manifold.

*** 07/30/2019 10:22:21 ***
IMG_3706.JPG added by Adrian Records on 07/30/2019 10:22:19

*** 07/30/2019 10:47:44 ***
Web - Note created on 07/30/2019 10:47:43 and created by Adrian Records
After allowing the system to remain under pressure for over half an hour, I have discovered a small trickle of fresh coolant. While I am unable to locate its exact point of origin, it is abundantly clear that it is leaking from some point above the exhaust ports.

*** Web - Advice created on 07/30/2019 10:48:11 and created by Sam Camarillo ***
1: I think it is the Head gasket leaking down onto the manifold top
I would do my initial suggestion as the loose head bolts are much more common

*** 07/30/2019 11:08:16 ***
Web - Note created on 07/30/2019 11:08:16 and created by Adrian Records
I'm not sure if you saw my latest update, as it is time-stamped only a few seconds before your reply came through. I have traced a small leak to a point above the the exhaust ports. I'm also slightly confused as to how the head gasket could leak on to the top of the exhaust manifold, as it is on the bottom of the cylinder head.

*** Web - Advice created on 07/30/2019 12:09:03 and created by Sam Camarillo ***
1: OK I see you last note. it sounds like a porous spot or crack on the head.
I realized what I wrote after I sent it but all notes are stuck in the case forever lol
I would get approval if needed to remove that head and inspect closer. Probably a good idea to send it out to get it checked.
Also when you remove the head bolts be conscious of the break away torque. I do see bolts pull on this model.

*** Web - Advice created on 09/25/2019 07:56:17 and created by Mike Ozonur ***
1: based on information provided recommend to replace the engine assembly,
2: Based on information you provided engine has to be replaced. Recommend that you Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines
3: For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin defaults

*** Web - Advice created on 08/22/2019 13:08:40 and created by Sam Camarillo ***
1: Please gain access to the head bolts closest to the area of the head gasket leak. Apply 45-50ft lbs of torque to them, see if the loosen or spin. If any do the threads in the cylinder block have stripped, will need short block replacement

*** Case has been auto closed by the system on 09/07/2019 01:08:06 (PST)
*** 09/24/2019 14:08:15 ***
Case Number: XXXXXXXX Reopen Requested by David Schuneman.
Reason: [tech applied 45ft-lbs of torque to head bolts closest to leak. tech found about 45 degrees of rotation on head bolts. since the engine overheated would a long block be recommended due to head possibly being warped? it will be hard to tell until the head is pulled.]

*** 09/25/2019 10:32:43 ***
Reopened with Sub Status of Working

*** Web - Advice created on 09/25/2019 10:36:03 and created by Tony Thomas ***
1: David. If the head bolts spin it will need a long block if they torqued and did not spin, you will need to pull the heads for inspection Be sure you validate proper maintenance has been performed and the overheating is not related to damage or neglect to the cooling system.

*** 09/25/2019 14:08:27 ***
Web - Note created on 09/25/2019 14:08:27 and created by David Schuneman
tech applied 45ft-lbs of torque to the head bolt closest to head gasket leak and found the bolts spun. tech inspected cooling system and found no damage to radiator or cooling components.

1: Thank you for the attachments to the case.
2: : We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add photos of the stripped bolts to the case.
3: If the heads are warped then replace the m and transfer all components.

*** Web - Advice created on 10/05/2019 08:19:24 and created by Eric Patterson ***
1: Or if there is any metal on the OCV screens please stop and attach photos to the case.

*** 10/08/2019 17:07:25 ***
Web - Note created on 10/08/2019 17:07:25 and created by Ryan Young
found no metal shaving on ocvs. found 4 headbolts spinning in the block, video attached (using a 3/8 ratchet to turn head bolts) . cylinder head warp is 0.003. photo attached of head bolts.

1: Is it possible to include the VIN in the video for documentation purposes? Please see video guidelines below. Thanks.
2: TL authorization required for all dealers – Video of condition required*
Video requirement examples below are for illustration purposes, individual requirements will vary based upon the condition reported:
• Video should be continuous and show the VIN

(most convenient VIN plate) and pan to show the engine condition
• For engine seizures, attempt to turn over engine with breaker bar in video with the belt off
• For hole in engine block, show hole in video
• For engine smoking condition (piston ring sealing), show smoke in video.

1: Hello Kevin
Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.

For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.
Based on the information you have provided, I recommend that you replace the engine following normal service procedures

as outlined in the Shop Manual. DO NOT order or install a QQK Campaign

*** Web - Advice created on 10/23/2019 11:15:36 and created by Frank Lusic ***
1: Hello Sean
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

*** 11/05/2019 06:52:34 ***

measuring psi

*** 10/29/2019 06:49:15 ***

Web - Note created on 10/29/2019 06:49:15 and created by Joseph Garone
radiator and cap holds safely at 15 psi for over 5 min

*** Web - Advice created on 10/29/2019 06:55:22 and created by Aldo Parada ***
1: What about the rest of system?

*** 10/29/2019 07:14:27 ***
Web - Note created on 10/29/2019 07:14:27 and created by Joseph Garone
system holdoprth externallyapplied and internal on its own as the car is running, my concern is stemming fromthe fact that the car overheats at speed (twice) on long trips. I'm feeling with the hot running presuure at 19psi plus that the system is pressure locked ,ie.compression pressure bleeding in .

*** Web - Advice created on 10/29/2019 09:00:56 and created by Aldo Parada ***
1: You will need to rephrase that paragraph, I do not know what you are trying to tell me. How did you confirm issue, have you driven it and got the vehicle to over heat yourself?

In addition, check your thermostat for proper operation, use KDS to check when it opens and it opens at the correct time.

*** 10/29/2019 09:43:06 ***
Web - Note created on 10/29/2019 09:43:06 and created by Joseph Garone
as the engine is running the pressure on the radiator goes over 19 psi . my concern is a bad head gasket leaking

*** Web - Advice created on 10/29/2019 11:11:48 and created by Aldo Parada ***
1: You said the system holds pressure when doing cooling system pressure test. If the head gasket was leaking you would loose pressure.

When you run vehicle at operation temp does the radiator bubble with the radiator cap open?

*** Escalated to CA as: 13413353 on 10/30/2019 01:06:32 (PST)
*** 10/30/2019 06:05:57 ***
Web - Note created on 10/30/2019 06:05:57 and created by Joseph Garone
The radiator does not bubble but coolant does expand to the top of the neck I have enclosed three videos of the radiator pressures . Once car is off coolant in radiator goes back to a normal level..

*** Web - Advice created on 10/30/2019 09:17:10 and created by Aldo Parada ***
1: Have you successfully duplicated over heating concern?

The temperature differential you show from upper and lower hose has nothing to do with a blown head gasket, this is normal heat dissipation by the radiator, in addition the pressure you show from radiator will go up due to thermal expansion of the coolant at high temperature, again not a sign of blown head gasket.

*** 10/30/2019 12:23:49 ***

1: Thank you for that information. Please verify no coolant leaks, pressure check cooling system, perform a chemical block check and provide results.

Is there any power enhancement components on this vehicle?

Is there any evidence of vehicle being in a front end accident?

Is there any aftermarket cooling system components? Or components recently replaced?

Is the cooling fan operating properly when commanded with KDS?

Is the thermostat opening according to temperature gauge?

Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.

*** Web - Advice created on 10/01/2020 13:15:34 and created by Frank Lusic ***
1: If resistance is less than 2Ω then reconnect sensor only and check sensor resistance from ECM connector C300-A pins 54 to 58, see attached chart to check accuracy.

If everything checks out OK, then by back-proving ECT sensor pin 3 (green wire) provide a temporary external ground and see if readings improve.

*** 09/03/2020 06:26:32 ***

*** Phone - Advice created on 09/03/2020 14:03:04 and created by Juan Vazquez ***
1: Thank you Joseph for that call. Based on our conversation, this vehicle has a history of actually overheating 4 different times, the thermostat, water pump, radiator and ECT sensor have all been replaced. During this visit, the overheating was not verified, but the ECT sensor has skewed readings, sensor was replaced , readings were normalized and vehicle road tested for 106 miles without incident. Cooling system was checked for hydrocarbons and also pressure checked, no leads, head gasket does not show signs of leaks. Tech noticed that coolant temperature climbs up quicker on this vehicle when compared to others, but does not overheat. After the extensive road test the vehicle will be released to customer.

Joe - Thanks for your time today.

A, You said you drove the vehicle ~900 miles with out duplicating the concern.

B, We checked the connector / tension and wiring at C311- no problems were found.

C, I did locate and review the customers video.

1, lets check the pins at the PCM. in the same way - monitor the data for the ETC while moving the wire at the PCM and down to the sensor.

Thanks

1: Please obtain authorization from the DPSM, but we better check something first the engine may need replaced.

We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
2: Please see if any of the bolts will not hold, If they strip then please add a picture to the case of the stripped head bolts to the case Then I will have to approve a short block as well.

Customer states engine is overheating.

*** 10/25/2019 11:57:51 ***
Web - Diagnostics created on 10/25/2019 11:56:39 and created by Steve Karels jr
Scanned for codes and found none. Found coolant on top of trans. Filled cooling system and pressure tested, found no obvious leaks. Bled cooling system and test drove. During test drive, found engine started overheating after approx 8 to 10 miles of driving. Pulled over vehicle and let cool down. Had vehicle towed back to shop. Pulled all spark plugs and found coolant in cylinder 6. performed compression test and found cyl. 1 at 205 psi, cyl 2 at 190psi, cyl 3 200psi, cyl 4 at 140psi, cyl 5 at 200 psi and cyl 6 at 190 psi. Those readings were after long cool down period. Performed cylinder leak down test on all cylinders cold and found cyl 1 at 5%, cyl 2 at 8%, cyl 3 at 30%, cyl 4 at 67%, cyl 5 at 8% and cyl 6 at 5%. Reinstalled all plugs and warmed up engine again to normal operating temp and retested cyl leakage and found no real change in front cylinders however, vehicle will overheat under load. Fan works properly and thermostat is operating normal. I suspect head or gasket.

Web - Note created on 10/31/2019 12:03:19 and created by Steve Karels jr
Applied additional torque to head bolts around cylinder 4 as requested. Approx 47 ft-lbs. The two bolts between cylinders 4 & 6 spun. Thw lower bolt between cylinder 4 and 2 spun as well. Please advise

*** Web - Advice created on 10/31/2019 12:47:21 and created by Sam Camarillo ***
1: • Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. I recommend that you replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use

2: I have generated a PWA case for you .Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

1: Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083. Please replace the timing chain, the tensioner, guide rails with engine repair and intake manifold if metal debris is found related to the engine knock.

2: • Replace the engine with a long block, if available; otherwise, please order a short block assembly
• If the short block is replaced, replace the oil pump or BSM (make sure the to count the teeth on the gear prior to assembly), inspect the original cylinder head thoroughly to determine whether head replacement is required
• If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
• Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.
• If the failed engine had catastrophic damage (e.g., rod through the block, large metal debris in the pan od engine), do not use the original intake manifold; replace the intake manifold with a NEW one.
The Turbo and oil feed line should be replaced if a lack of maintenance or metal debris is found.
• Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.
Thank you

CUSTOMER STATES VEHICLE IS OVERHEATING AND BELIEVES WATER PUMP HAS GONE BAD. CHECK ADVISE.

*** 11/01/2019 09:23:38 ***
Web - Diagnostics created on 11/01/2019 09:23:38 and created by Jack Archer
Customer has put stop leak in the cooling system. Pressure tested, holding pressure.
Cannot duplicate the overheating right now but the upper hose has almost blown off from the pressure build up, the reservoir hose has also blown off.
I have a feeling the head bolts have probably stripped out. Please advise

*** 11/01/2019 09:24:49 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin default

*** Web - Advice created on 11/01/2019 09:34:18 and created by Brian Lall ***
1: Jack, did the customer advise that they added stop leak or did you see evidence of it. If there is evidence of outside chemicals take a picture of video showing it and attach it to the case. Please let the vehicle cold soak then double check from cold start making sure the thermostat is opening as designed, making sure the heater works as designed, and making sure with the radiator cap removed if you increase the rpm that the coolant flow increases. Please also perform a block check. Let me know what you find Thanks.

*** 11/01/2019 13:37:20 ***
Web - Note created on 11/01/2019 13:37:19 and created by Jack Archer
I can see evidence of it. The customer states they only added coolant. I will have to cold soak the vehicle over the weekend as I do not work this saturday and it is currently still warm. I have attached pictures of inside the reservoir where I see evidence of what appears to be stop leak and also the radiator.

*** 11/04/2019 08:26:59 ***
Web - Note created on 11/04/2019 08:26:59 and created by Jack Archer
Started vehicle after cold soak. Cylinder 4 misfire active upon startup. Heater operation is normal, lower radiator hose does not get warm. Coolant flow increases slightly in tad with rpms increased. I have a block tester coming tomorrow

*** Web - Advice created on 11/04/2019 08:47:11 and created by Brian Lall ***
1: Thanks for letting me know what you found. Since there was a cylinder 4 misfire at start up, please let the vehicle get warm then pressurize the cooling system and let it cold soak under pressure with all the spark plugs out. After a cold soak inspect all the cylinders with a bore scope and note if you can see any coolant in the cylinders.

*** 11/04/2019 11:44:51 ***
Web - Note created on 11/04/2019 11:44:51 and created by Jack Archer
After pressurizing the cooling system with plugs removed, pressure dropped from 14 to 7 PSI in a little over an hour. Checked cylinders with scope, found the top of cylinder 4 damp, no pools of coolant but damp compared to the rest. Sourced a block tester, passed block test

*** Web - Advice created on 11/04/2019 12:40:39 and created by Brian Lall ***
1: If there is coolant going into cylinder 5, even if it passed the block test my recommendation is to get authorization from the DPSM to remove the bank 1 head and to inspect the head and block for any damage and for the flatness of the gasket surface and to repair or replace components as needed. Keep me updated with what you find or if you find anything that requires engine replacement durring the repair process. Thanks.

*** 11/07/2019 11:42:58 ***
Web - Note created on 11/07/2019 11:42:58 and created by Jack Archer
It was cylinder 4 but I got authorization and started removing bank 2 head, checked the 2 head bolts I had access too after removing the valve cover and they both just spin. I can attach a video if you would like. Engine will need to be replaced, most likely short block. Would you recommend replacing heads if no long block is available?

*** Web - Advice created on 11/08/2019 07:19:29 and created by Brian Lall ***
1: Jack, thanks for clarifying and for letting me know what you found. My recommendation is to replace the engine and I will create and authorize a PWA case for you. You will need to check the heads for flatness or damage if no long block is available and only replace them if needed. If they are not flat and are out of spec they should be replaced, Kia does not recommend resurfacing heads You will need to refer to PS539 for engine component replacement. Thanks.

1: Darnell, I can't make out a knock in your video. I hear something high pitched that could be top end. Try varying the rpm in your video so we can hear it loaded and on unload. Or, lets concentrate on the overheat.

*** Web - Advice created on 11/08/2019 10:29:04 and created by Greg Phillips ***
1: Darnell, I can't make out a knock in your video. I hear something high pitched that could be top end. Try varying the rpm in your video so we can hear it loaded and on unload. Or, lets concentrate on the overheat. Did you get a photo of the valve train? Have you looked into the cylinders to see if they are filling with coolant? And if you have the valve cover off, check the torque on the head bolts that you can access without removing the cam shafts. Are any of them loose, can they be torqued back down? If they are loose, are you able to remove them and get a photo of the threads?

*** Web - Advice created on 11/08/2019 10:56:01 and created by Greg Phillips ***
1: Darnell, there is still no clear knock in your video. When you have a noise that isn't very loud, and you hold the RPM the same the entire time, it actually makes it harder to pick out in a video. You have to try varying the RPM. This loads and unloads the failed bearing or wrist pin and the noise it makes will vary in frequency slightly from the engine for a second. This will make the noise stand out in your video. Or chase the overheat instead.

*** 11/08/2019 11:19:13 ***
Web - Note created on 11/08/2019 11:19:13 and created by Darnell Reese
Performed coolant pressure a duplicated a leak coming from rear cylinder head oil coolant mixture was trickling down block appears to be failed head gasket on rear c cylinder head. Did not remove valve cover yet because was still inspecting for leak. Do you want me to remove valve cover now after pressure test.

*** 11/08/2019 11:19:15 ***

Coolant leak from RH cylinder head gasket

*** 11/15/2019 15:35:48 ***
Web - Diagnostics created on 11/15/2019 15:35:48 and created by Kyle Marchi
Confirmed coolant leaking from RH cylinder head gasket just at corner toward front bumper/transmission. During cylinder head removal for further inspection found cylinder head bolt at effected corner had no torque. When bolt was removed found bolt had stripped block of threads. Further inspection of engine components found excessive deviation in LH bank between intake and exhaust cvvt assemblies as well as RH bank intake cvvt.

*** Web - Advice created on 11/16/2019 09:10:54 and created by Sam Camarillo ***

1: Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Replace the engine with a long block, if available, If a long block is not available then replace the short block and follow Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.
2: PWA covers collateral damage, if the CVVT's are loose write down the reason they are being replaced and it will be covered. I would recommend the cams be replaced as well as the pins are probably loose.

*** 11/16/2019 09:11:01 ***

*** Web - Advice created on 11/16/2019 09:27:10 and created by Sam Camarillo ***
1: Most likely it will need an engine replacement, when the head gaskets leak it is often lifts the head and strips a bolt
This will be a CP job, I see it is second owner. If they approve further diagnosis I would try to get 40-50 lbs of torque on a head bolt near the leak see if it spins.

*** 11/18/2019 08:31:40 ***

1: Thanks Maurice,
Let me know when the vehicle is repaired per FTS findings.

*** Web - Advice created on 12/11/2019 08:20:02 and created by Chris Schang ***
1: Service manager called in,
Manager is looking for more information. Manager states that disabling the #4 coil causes the noise to cease. Agent is reviewing the case information and asked if the intake manifold has been inspected for any damage and manager states no, it has been swapped. manager states that no machine work was done by the machine shop. Manager is advised that 2 of the OCVs are covered in silicone and should not have any silicone on them. Manager is also advised to have his tech pinch off the purge valve and see if the noise goes away.

*** Web - Advice created on 12/12/2019 11:57:26 and created by Frank Lusic ***
1: The service manager called in and we discussed the case
they determined that under load there is a popping in the intake only on cyl #4
they said that both intake CVVTs were not locking , I asked that both CVVTs and cams be replaced
I asked them to check the crank sensor on tone ring for damage
I had them check the intake spring strength and all were equal

1: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.
2: : We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Thank you, I see the threads are damaged.

I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
3: Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

Engine overheating

*** 12/02/2019 05:16:32 ***
Web - Diagnostics created on 12/02/2019 05:16:03 and created by Martin Ceciliano
Vehicle was low on coolant.During top off and bleeding bubbles would not stop coming up out of the radiator. Suspect blown head gasket.
Confirmed by performing a cylinder leakage test and found number 6 cylinder leaking into the coolant passage. When removing the left hand cylinder head, the head bolt on the outside corner of the head came out with the threads that should be in the block.
Was told to get approval from you to put a short block in it.
Any suggestions?? Thank you.

ATTACHED PICTURE OF SPARK PLUGS. PLUGS NOT REALY FOULED, BUT #5 WAS WET. COMPRESSION TEST RESULTS- #1-190 PSI (8% LEAKDOWN) #2- 195 PSI (6% LEAKDOWN)
#3-185 PSI (10 % LEAKDOWN) #4- 190 PSI (10% LEAKDOWN) #5- 170 PSI (17% LEAKDOWN) #6- 190 PSI (8 % LEAKDOWN) CYLINDERS PUMP UP, BUT #5 COMPRESSION ALOT
LOWER THAN OTHER CYLINDERS. TOPPED OFF COOLANT ON THE 2ND OF DECEMBER AND COOLANT LEVEL IS LOW AGAIN.

*** Web - Advice created on 12/09/2019 06:39:09 and created by Steven Okimura ***
1: John, based on the information provided the cylinder head should be removed with DPSM approval and check the head and block for flatness, if out of spec, Kia does not recommend resurfacing and replacement is necessary. Before removing the head bolts, check if they with torque to specs or continue to rotate indicating a bad block.

1: Perfect, Thank you for the information.

I appreciate it. This vehicle is out of warranty. Just making sure you know.

Valvetrain looks acceptable.

We need to see if the block is re usable. Please see below. please attach a picture if there is a failure ang bank 1. Then you can recommend to the Customer the proper repair.
2: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

*** 12/13/2019 06:26:19 ***
Web - Diagnostics created on 12/13/2019 06:26:19 and created by Chris Ramirez
I brought the vehicle into the shop and checked the coolant level and saw that it was low on coolant. I topped of the radiator with about half a gallon of coolant. I performed a quick visual inspecton of the engine and found some coolant laying on top of the transmission. I removed the air box from the vehicle and performed a visual inspection again with a mirror but did not find anything obvious. I cleaned off the top of the transmission and let the vehicle run for about an hour and rechecked and again found no signs of coolant leaking back on the top of the transmission. I installed the coolant pressure tester and pressurized the cooling system and rechecked for leaks and again found no coolant leaking back on top of the transmission. I lift the vehicle and removed the undercover and found that the front side of the transmission was covered in coolant. I cleaned the entire transmission off again this morning.

*** 12/13/2019 06:30:38 ***
Web - Note created on 12/13/2019 06:30:38 and created by Chris Ramirez
I started the vehicle from a cold start and found coolant traveling down the seam of where the head meets the engine block. I took pictures of what I am seeing. I took a picture of it cleaned off and then one more after the engine was running for about 10 minutes. With a mirror I followed the seam up to under the water temperature control assembly and did not see coolant leaking out of it. I attached a picture of that as well by using a mirror. The coolant I found on top of the transmission is a mystery to me though... Im not sure how possible it would be for air turbulence to push this coolant up and on top of the transmission on the other side. I also attached a picture of that.

1: it looked like where the cylinder head meets the block is leaking.
If that is the case please do the following:
Please gain access to the head bolts closest to the area of the head gasket leak. Apply 45-50ft lbs of torque to them, see if the loosen or spin. If any do the threads in the cylinder block have stripped, will need short block replacement

*** 12/19/2019 10:36:40 ***
Web - Note created on 12/19/2019 10:36:39 and created by Chris Ramirez
Okay I got the cams out of the way and checked the bolt nearest to the source of the leak and found that with just using my hand I was able to move the bolt. I did put a ratchet on it and like you mentioned it kept spinning and never tightened up. I removed the bolt and sure enough the bolt came out with the threads attached to it. I attached a picture of the bolt

1: I have generated a PWA case for you .Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

1: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.

If the leaks are spotted, please see line #2
2: : We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** Phone - Advice created on 12/13/2019 09:03:41 and created by Aldo Parada ***
1: Tech called in, he states he did not perform a compression test or a leak down test on engine. However he did perform a leak down on cylinder #1 which yield 20% coming from the radiator. Tech also states he cannot perform any further testing as valve cover is off and engine"dissembled."

Please at this time remove the 3 stripped bolts and add clear pictures of the bolt thread for review, per Eric request. Thanks!

*** Web - Advice created on 12/14/2019 09:11:02 and created by Eric Patterson ***
1: Thank you fore the information.

Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
3: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

*** 12/19/2019 08:18:01 ***
Web - Diagnostics created on 12/19/2019 08:18:01 and created by Christopher Anders
Verifyed. Inspected coolant level and found that it is low. Filled coolant up and performed coolant pressure test. Found that right hand cylinder head gasket is leaking. I have seen this before on v6 engines where the cylinder head bolts have come loose and warps the block or head and causes this concern. Inspected right hand cylinder head bolts and found several that were loose. Tried tightening bolts and one bolt almost wanted to strip the threads out so I stopped.

1: Please gain access to the head bolts closest to the area of the head gasket leak. Apply 45-50ft lbs of torque to them, see if the loosen or spin. If any do the threads in the cylinder block have stripped, will need short block replacement

*** 12/24/2019 11:12:29 ***
Web - Note created on 12/24/2019 11:12:29 and created by Shawn Dulany
took valve cover off and applied 50pds of tourqe and the head bolts wont torque down,just spin.stripped head bolts.

*** Web - Advice created on 12/26/2019 07:20:34 and created by Sam Camarillo ***
1: I have generated a PWA case for you .Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

1: Hello Tim
There have been cases where the treads in the block that are for the head bolts strip out, please remove the cam shafts on the bank that is leaking, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced, Please report your findings

1: Were the heads sent out to the machine shop?
Was the oil pump replaced?

Thank you for the attachment added to the case. I see the metal debris.

2: So the vehicle has not left since the engine was replaced just double checking.
Also this is a new repair order number correct?

*** Phone - Advice created on 01/09/2020 09:10:46 and created by Eric Patterson ***
1: Tech has called in.

Oil pump was not replaced due to the vehicle just had a coolant leak.

Also the heads were not sent out due to the heads had no metal inside. There were no oil pressure concerns or metal found in the pan at all.

Thank you for the information, just making sure.

Tech will add the picture of the serial number to the case. The blue re-man tag is missing.
2: New oil pump has been ordered and the heads have now been sent out due to the metal now found in the engine.
3: Once the picture is added I will create the reman PWA case for the engine replacement. Thanks Chris

1:
We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

customer states rear head gasket leaking

*** 01/14/2020 07:32:45 ***
Web - Diagnostics created on 01/14/2020 07:29:19 and created by Darrell Scott
pressure tested cooling system confirmed leak at rear cylinder head.

my question is i received this vehicle and disassembled it after verification of leak it wasnt under warranty due to not first owner and over 60k. now i have found out that there is an issue with head bolt holes pulling treads (no puled threads at the time of disassembly). when i reassemble this IF THE THREADS PULL from the block what is kia s stand if any on this known issue. should i attempt a strength test prior to assemble to confirm bolt hole integrity. the goal here is to not have to contact the customer with bad news stateing the block need replaced. there was a tech case opened on this at freedom kia for oil in the coolant which is the direct result of the rear cylinder head leakage.

*** Web - Advice created on 01/14/2020 10:42:06 and created by Brian Lall ***
1: Darrell, I understand your concern. There is no associated warranty extension for this concern. If when you are assembling the engine one or more of the head bolts will not tighten as designed due to the threads in the block, then the block will need to be replaced. I know this vehicle is no longer under warranty but it appears to be a CPO vehicle so you would need authorization through the CPO warranty company. Thanks.

Greetings, we are taking in a bunch of engines from another dealer that could not complete work in a timely fashion
ENGINE has been sitting for I would assume multiple months considering rust on cams has built up substantially.
It appears there has been a techline case opened on this VEHICLE in September, NEED PWA for multiple non-normal parts such as cams, springs, essentially rebuilding entire r/h head due to rust and corrosion build up. Attached are photos, crank is indeed seized and they have r/h bank rocker cover off.

*** Web - Advice created on 01/17/2020 07:10:52 and created by Jerry Gossling ***
1: Chad,
From what I can tell this vehicle originally had an overheating issue due to the head bolts.
Pleas provide a video of the vin # and of you attempting to tighten down the head bolts.
I need to clearly see the head bolts will not retain torque.

NOTE, as for the rusted components, I recommend to thoroughly clean the components with WD40 and a shop towel. If this does not work you can use zero grid steel wool, But you must make sure the components are thoroughly cleaned when done so the steel wool does not contaminated the new short block or any other parts.
Thank you

*** 01/17/2020 08:17:14 ***

1: Chad,
You have validated the warranty. Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083. Thank you,

1: Thanks for letting me know what you found and for the picture. What is the engine oil and transmission fluid level?

*** 01/20/2020 14:10:14 ***
Web - Note created on 01/20/2020 14:10:14 and created by Philip Bodtmann Jr
OIL LEVEL IS LOW AND TRANSMISSION FLUID IS AT CORRECT LEVEL

*** Web - Advice created on 01/21/2020 10:39:40 and created by Brian Lall ***
1: There is no oil cooler on this engine and no common place the oil can mix. My recommendation is to contact the DPSM for authorization to remove the heads and to inspect the heads, head gaskets, block, and all cooling systetm hoses for damage. If you find the head bolts are loose or the block threads are damaged stop and update the case with pictures or videos showing what you found. Thanks.

*** 01/23/2020 12:08:56 ***

1: Thanks for the video, I was able to verify the concern. Based on the informatinon provided, my recommendation is to replace the engine following normal service procedures. I am going to create and authorize a PWA case for you. You will need to replace the water pump, thermostat, any hoses that are swollen or damaged from the oil, and completely clean and flush (or if they cannot be cleaned replace them) the heater core, radiator, coolant reservoir, and any hoses or pipes that are not replaced.

*** 01/24/2020 08:19:42 ***
PWA Case created for RA Case 13515368 by Brian Lall

*** 01/24/2020 08:19:42 ***
Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

*** 01/25/2020 05:08:43 ***
Case Number: XXXXXXXX Reopen Requested by Philip Bodtmann Jr.
Reason: [only short block engines are available...should cylinder heads and balance shaft be replaced as well.]

*** 01/27/2020 05:49:39 ***
Reopen Denied by Brian Lall
Reason: Please follow PS539, the oil pump should always be replacec with an engine but the heads should be cleaned and reused if not damaged or if they are warped, damaged, or cannot be cleaned, replace them

Customer states check engine light comes off and on. NOISE AT START-UP.

*** 01/24/2020 09:02:55 ***
Web - Diagnostics created on 01/24/2020 08:25:49 and created by Aaron Mathenia
Verified noise. Pulled code and found p0014, Referred to tsb eng 046. .removed intake and surge tank to gain access to exhaust occv. When removing lower intake coolant was found inside of rh most forward bolt hole, and along head gasket/block line.
Occv valve has small debris. seemed to clean up okay. Test okay for resistance.
Seen in history this repair was done before for same code {p0014} but used a new solenoid.
This was approximately 5k miles ago.
Found tsb eng 148 for the noise i heard at start up.
Are these two issues related or separate concerns?
Not sure of direction of repair.

Web - Problem Description created on 01/29/2020 11:23:38 and created by Matthew Strader
Mixed coolant and oil, no oil pressure.

*** 01/29/2020 11:23:39 ***
Web - Diagnostics created on 01/29/2020 11:23:39 and created by Matthew Strader
Vehicle came in on 12/28/19 with a coolant leak. Found coolant leaking from LH cylinder head. Oil and coolant were not mixing and no drivability issues were present. After replacing cylinder head, oil pressure will not build at idle. Coolant and oil is mixing. Performed compression test. Compression built to 180 on cylinders 2,4, and 6. After 5 revolutions during the compression test, cylinders 4 and 6 had 180 psi, while cylinder 2 would only build to 150 after 5 revolutions. Original coolant leak was on cylinder 6. I did not remove the RH cylinder head while performing repairs. I did not find any issues with the engine block when I removed the head.

1: Hello Matthew
If I under stand you correctly after the bank 1 head was replaced there is low oil pressure and oil is mixing with the coolant , is that correct?

*** 01/29/2020 14:30:17 ***
Web - Note created on 01/29/2020 14:30:17 and created by Matthew Strader
Yes. I am assuming either a faulty head or gasket. I removed the timing cover after and resealed and replaced all gaskets and o rings on the timing cover again to be positive leak was not from any seals on the timing cover.

*** Web - Advice created on 01/29/2020 14:40:55 and created by Frank Lusic ***

1: I just tried calling you, I am leaving in a few minutes , call me in the morning

*** Service Alert Escalated to CA as: 13529090 on 01/30/2020 01:05:12 (PST)

*** Phone - Advice created on 02/04/2020 12:12:46 and created by Eric Patterson ***
1: Tech has replaced the Bank 2 cylinder head.

Tech is having issues with compression with #2

Cylinders 4,6 came to 180 in 5 strokes
Cylinder 2 came up to 180 but 6 strokes.

Coolant is definitely going into the engine oil some how. Please pressure check the cooling system and see if coolant lands in the cylinder . please use a borescope and let the Agent know. thank you again.

*** Web - Advice created on 02/04/2020 12:57:32 and created by Frank Lusic ***
1: I am back please call me

*** 02/05/2020 06:58:38 ***
Web - Note created on 02/05/2020 06:58:38 and created by Matthew Strader
I will call again later if needed, but it seems that there is no coolant leak. I left 16 psi of pressure on the system for 30 minutes and there were no drops in pressure. I flushed the oil again and it is not a milky color. I still can not build oil pressure at idle. Maybe the oil pump is faulty? I did not take the timing chain off the oil pump so it should not be off timing.

*** Web - Advice created on 02/05/2020 07:14:37 and created by Frank Lusic ***
1: please call me

*** Web - Advice created on 02/05/2020 07:15:32 and created by Frank Lusic ***
<For Internal Use Only
only one head removed ? possible engine issue>

*** Web - Advice created on 02/05/2020 09:58:31 and created by Frank Lusic ***
1: Matthew called in and we discussed the case and what occurred before and after the engine was repaired , My concern is that the rear head was not removed and I am concerned that there may be an issue with the threads in the block for the head bolts
1, the engine still does not have oil pressure at idle and is making a rattle at idle
2, the coolant that was in the engine after is was running for a time may have damaged internal engine components
Based on all of these item I believe that the engine should be replaced

2: I have generated a PWA case for you; Based on the information you have provided,
I recommend that you replace the engine following normal service procedures.
Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

*** Web - Advice created on 12/03/2019 10:29:32 and created by Tony Thomas ***
1: The marks on the engine are for reference only. The timing is set up correctly by lining up the colored links on the chain with the marks on the gears. When the cam gears are lined up parallel the crank mark is usually off slightly.

*** 12/03/2019 10:41:31 ***
Web - Note created on 12/03/2019 10:41:31 and created by Daniel Frazee
ok if they are just for reference, why do all the other marks line up, and the back camshaft does not? also kgis states that you use these marks to confirm timing after rotating engine two times. nowhere in service procedures does it say that marks are "approximate". suspect timing chains are stretched...

*** Web - Advice created on 12/03/2019 11:06:22 and created by Tony Thomas ***
1: It should not have stretched chains after only 18000 miles but it is possible. If you did use the links for alignment to the marks I think you should proceed with the repair and test for normal operation.

*** Web - Advice created on 12/03/2019 11:22:05 and created by John Nguyen ***
1: Technician called in stating that he thinks that both heads are warped due to engine overheating which also in turn caused the timing chain to stretch. He stated that out of all four of the timing marks the timing chain lined up at 3 of the four marks indicating the possibility of the chain being stretched. I advised technician that Tony will have to look at this case when he returns from lunch.

*** 12/03/2019 11:27:30 ***
Web - Note created on 12/03/2019 11:27:30 and created by Daniel Frazee
i didnt say that i think the heads ARE warped, I said that the heads WERE warped and thats why they were replaced previously, however timing chains were not, and i think that the timing chains are stretched from previous heads warping when engine overheated...

*** Web - Advice created on 12/03/2019 12:50:56 and created by Tony Thomas ***
1: Order new chains and do a side by side comparison by hanging them from the same point to see if they have stretched.

*** 12/10/2019 10:01:17 ***
Web - Note created on 12/10/2019 10:01:17 and created by Daniel Frazee
reset timing. installed new chains due to updated p/n. test drove vehicle, still sputtering under heavy accel. no codes have set yet.

*** Web - Advice created on 12/10/2019 10:10:58 and created by Tony Thomas ***
1: Test fuel quality and alcohol content per Technician Basics TB006. If you do not have the kit, the test can be done with a plastic water bottle and magic marker. For quality, it should have a strong fuel smell, clear yellowish color. Burn a small amount (a few drops) by smearing a few drops into a metal pan and see if you have an oily residue left over.
2: If fuel is okay, take a flight recording of all engine data while duplicating the concern and attach it to this case for review.

*** 12/10/2019 10:48:05 ***
Web - Note created on 12/10/2019 10:48:05 and created by Daniel Frazee
fuel has 8-10% alcohol content

*** Web - Advice created on 12/10/2019 10:56:07 and created by Tony Thomas ***
1: That's a bit high but acceptable. Any residue left over from the burn test?

*** 12/10/2019 11:42:23 ***
Web - Note created on 12/10/2019 11:42:23 and created by Daniel Frazee
no not really any residue that i could tell

*** Web - Advice created on 01/28/2020 04:44:04 and created by Tony Thomas ***
1: Bank 1 intake is off by more than 20 degrees in the recording. This appears to be a mechanical problem as the actual timing is moving and cannot keep up with the desired.

*** 01/28/2020 06:43:21 ***
Web - Note created on 01/28/2020 06:43:21 and created by Jason Church
The mechanical timing is not off. The only things that have not been replaced are the intake oil control valves and the exhaust oil control valves. The mechanical timing is not off. If this engine was overheated excessively (it was a rental car after all), who knows if the block got warped and there is an internal oil leak on that back bank or if something is plugging an oil passage. If it is at all possible, would a reman engine be available for replacement?

*** Web - Advice created on 01/28/2020 07:16:11 and created by Tony Thomas ***
1: I am not accusing you of setting the timing up wrong. The actuator controls the mechanical position of the camshaft and in the recording I see the timing not staying with the desired. This system uses a Variable Force Solenoid (VFS) on the intake cams which supplies the engine oil to the cam phaser or cuts the engine oil from the cam phaser in accordance with the ECM PWM (Pulse Width Modulation) control signal, the Cam Phaser which varies the cam phase by using the hydraulic force of

the engine oil. Remove the variable force solenoid to access the OCV plunger and check for debris or sticking plunger. Clean or replace as necessary and test for normal operation.

*** 01/28/2020 15:48:54 ***
Web - Note created on 01/28/2020 15:48:54 and created by Jason Church
When I replaced the camshafts and CVVTs, I inspected the plungers to verify that they moved in and out freely and there was no debris present.

I have just removed the VFS and actuated the VFS to verify that it is actuating properly. I also re-inspected the OCV plungers to make sure that they move freely.

*** Web - Advice created on 01/29/2020 05:37:55 and created by Tony Thomas ***
1: If battery supply voltage is good swap the VSF solenoid and retest.

*** 01/29/2020 11:06:40 ***
Web - Note created on 01/29/2020 11:06:40 and created by Jason Church
I have swapped the variable force solenoids from bank 1 to bank 2 and the scantool data doesn't change.

I did notice that the bank 2 intake camshaft data does not move like bank 1 all the time. Sometimes bank1 will move to 163 deg, and bank 2 will stay at 132 deg. I have attached a screen shot. This data is the same if I swap the vfs' back as well.

Also what I have noticed just now as i have been seeing in the vehicle and watching the cams, is that the oil pressure light comes on and off while idling the engine for a long period. Comes on for 10 seconds and goes back off for 30 seconds

*** Web - Advice created on 01/23/2020 12:48:20 and created by Steven Okimura ***
1: The power train box is not checked indicating its not under warranty, is this correct?

If it is covered, attach proof with the customers name, Inspect spark plugs and determine which cylinders are leaking. Please remove the valve cover and take a few photos of the valve train (not the valve cover) to determine if the engine was maintained properly, attach the photos to the case.
Try torquing down the head bolts near the leak, if the head bolts fail to tighten the block should be replaced. If this is the case, attach an engine core data form and I will create a PWA case for you.

1: David,
Do you have any store freeze frame data?
Does the misfires only occur on cold start up?

NOTE, there's no attachments in the case?
Thank you

*** 01/14/2020 10:06:05 ***
Web - Note created on 01/14/2020 10:06:05 and created by David Sanchez
yes. I will upload freeze frame data. see attachment. and I will also upload the spark plugs pictures.
does not have to be at cold start up. also happens when vehicle warms up.

1: David,
Please use a quality bore scope with a mirror to check the tips of the fuel injectors for excessive carbon build up and the back of the intake valves.
Thank you

*** 01/16/2020 09:02:13 ***
Web - Note created on 01/16/2020 09:02:12 and created by David Sanchez
ok. checked cylinder 2 and 4 with boroscope. fuel injectors do not show a lot of carbon. also the intake valves look decent. pressurized coolant system to inspect for faulty head gasket. used boroscope to see the cylinder walls. can see drops of what appears to be coolant seaping through the head gasket. looked around with the boroscope and can see carbon around the top of the cylinder where it meets with the head gasket. but on one side the carbon is completely cleaned off. I suspect faulty head gasket. coolant leaking slightly and cleaning that side of the cylinder. top of the piston also looks like half of it is cleaner than the other. will attach pictures.

going to start by replace head gasket bank2

1: David called in per my request to discuss the case. David found a small grove in the cylinder wall of cylinder # 4.
David is able to catch his finger nail on the grove and there is a large nick on the surface of the block as well.
Based off of this information I advised David I would generate a PWA case for short block replacement.

*** Web - Advice created on 02/03/2020 10:51:46 and created by Jerry Gossling ***
1: For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083. Thank you

one

*** Web - Advice created on 02/05/2020 07:09:26 and created by Chris Schang ***
1: Justin,
If one is not available, the heads will have to be removed and inspected for warping. If warping is found the heads will have to be replaced. If there is no scoring, the heads can be removed. DO NOT machine the heads at all. I have already seen the valve train from your video so maintenance is fine. I will create and approve a PWA for the engine. Since the RA case will close when the PWA is generated, please call in if you have any questions or concerns after tear down and removal.

Case Number: XXXXXXXX Reopen Requested by justin landes.
Reason: [After engine replacement vehicle still has misfire, has confirmed misfire, vehicle misfiring on every cylinder at different times, timing has been checked and confirmed proper, spark plugs have been gapped properly, coils have been swapped with known good, injectors all firing properly, no air leakage that we can find, fuel pressure is at proper pressure,
wires have been checked for wiggle test and pin tension at coils and pcm, pcm was swapped with know good, only thing I can determine is the positive battery post was soldered together at one point, I swapped the post from another car but problem still there I'm attaching a picture of the battery for your inspection and I will take a flight recording if you need to see what I'm seeing]

*** 06/01/2020 06:53:01 ***

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin default

*** Web - Advice created on 02/05/2020 13:26:13 and created by Frank Lusic ***
1: Hello Jimmy
misfires and low compression on just one bank can be attributed to cam timing being off

Please perform the following diagnostic steps, with the engine cold remove the valve cover
1, check cam timing
2, then using a wrench on the crank bolt, rotate the engine backwards slightly (¼ of a turn) then check the timing chains to determine if there is slack between the cam gears , attach a video of your findings to this case

*** 02/05/2020 14:31:15 ***

1: Do you have any misfires? Please do a block check to confirm the head gasket is leaking. If it fails block check Please gain access to the head bolts.. Apply 45-50ft lbs of torque to them, see if the loosen or spin. If any do the threads in the cylinder block have stripped, will need short block replacement. Let me know what you find.

*** 02/06/2020 13:14:20 ***

performed block test, passed test using bluepoint combustion tester. fluid did not change color. should I proceed in checking the head bolts?

*** Web - Advice created on 02/06/2020 13:36:18 and created by Sam Camarillo ***
1: It does sound like a head gasket leak I am surprised the block check didn't find it. I would search around both banks of the engine where the head meets the block and look for signs of leakage or corrosion.
is there another block tester you can use? on rare occasions I have seen the fluid go bad.

*** 02/07/2020 12:06:47 ***

pulled timing chain and cams out of vehicle to gain access to head bolts and cylinders #1,2, and 3 are stripped. will not tighten at all, thanks.

*** Web - Advice created on 02/12/2020 06:29:47 and created by Sam Camarillo ***
1: Thanks I will recommend engine replacement
I have generated a PWA case for you .Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

replaced short block and oil was leaking.

*** 02/07/2020 08:28:07 ***
Web - Diagnostics created on 02/07/2020 08:28:06 and created by Blake Weber
After replacing the short block and starting the vehicle there was an oil leak present. I had torqued everything the specification and the bolt pattern. Found oil leaking coming from Bank 1(1,3,5) near the exterior head bolt on the corner towards the oil filter housing. Went the make sure that the bolt was torqued correctly when i was installing the heads and the bolt was now spinning freely. Took the bolt out and noticed there were some of the block threads on the bolt. Tried to use another bolt to see if it would fix the leak but there weren't enough threads to torque the bolt to specification. Can attach video of the oil leaking from the head.

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin All Others

*** Web - Advice created on 02/07/2020 15:38:37 and created by Eric Patterson ***
1: There was not a kink in the hose when bypassed correct?

Most of the time this is due to the system having an air packet. This may be caused by exhaust gasses in the cooling system. Possibly could be a head gasket concern.

Then please perform a block check and add a short video or a clear picture of the fluid color after the color change please. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.
2: Please perform a block check. Also look under the vehicle for signs of coolant seepage from the head gaskets.

*** 02/07/2020 15:54:47 ***

1: Thank you.
2: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** Web - Advice created on 02/18/2020 16:09:40 and created by Eric Patterson ***
1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make

sure all the check balls are installed in the oil galleys as well.

3: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

1: Hello Jeff
A misfire on start up can either be injectors or tight valve clearances
1. since you already have the valve cover off you can check the valve clearance and adjust as necessary
2, check the compression
3, then if okay replace the injectors

*** 02/21/2020 11:37:47 ***
Web - Note created on 02/21/2020 11:37:47 and created by Jeff Austin
valve clearance is good. compression is good. should i be using the injectors from the TSB part number ending in 560 or use the injectors that the parts catalog calls for ending in number 550? were the 560 injectors an upgrade?

*** Web - Advice created on 02/21/2020 11:48:23 and created by Frank Lusic ***

1: Hello Bryan
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 02/25/2020 13:02:35 ***

1: Thank you based on this information the engine will need to be replaced
I have generated a PWA case for you; Based on the information you have provided,
I recommend that you replace the engine following normal service procedures.
Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

DIDNOT FINE ANY SIGNS OF COOLANT LEAKAGE FROM THE HEAD GASKET.

*** Web - Advice created on 02/25/2020 14:01:50 and created by Juan Vazquez ***
1: Then please perform a block check and add a short video or a clear picture of the fluid color after the color change please.

You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas can’t get up to the neck.

*** Web - Advice created on 03/16/2020 11:07:18 and created by Juan Vazquez ***
1: thank you for that information. At this point if you were able to torque all the bolts without damaging the block treads and no metal was found on the OCV valves, the next step is to remove heads, inspect and replace gasket as necessary.

NOTE: once heads are removed, it is a good practice to send them to a machine shop and have them pressure tested.

2: NOTE: if the repair cost exceeds $1000.00 then please contact your DPSM for approval.

*** 03/24/2020 14:50:42 ***
Web - Note created on 03/24/2020 14:50:41 and created by Trevor Flaherty
REMMOVE HEAD AND FOUND THAT HEAD GASKET WAS LEAKING AND THE BOTH CYLINDER HEADS ARE WARPED

OUT OF SPEC the left head is .102mm and the right head is .110mm
the block is within spec.

*** Web - Advice created on 03/24/2020 14:59:03 and created by Juan Vazquez ***
1: Thank you for that information. Based on information provided, I recommend replacing both cylinder heads, no PWA needed to replace heads, thank you.

NOTE: if the repair cost exceeds $1000.00 then please contact your DPSM for approval.

1: Thank you for checking that out and sending in the photo.
Based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

DO NOT order or install a QQK Campaign Engine as the failure mode is not currently covered under any open campaign.(PI1802,1803,1805,1806)

2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

After removing both valve covers and intake manifold the head bolts won't retain 60 ftlbs

*** Web - Advice created on 03/02/2020 09:52:33 and created by Jerry Gossling ***
1: Aleika,

based off of your provided information, I am going to generate a PWA case for engine replacement per Pitstop 539.

NOTE,
All the following items will require replacement: Coolant hoses, Heater hoses, Thermostat & gasket, Reservoir bottle & hose. Anything contaminated by the oil.
The heater core & radiator will require thorough flushing to remove all oil contamination.
NOTE,
I don't know if these items are under warranty so you will need to check with Kia warranty or your DPSM.
Thank you

2: For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083. Thank you

1: Thank you for the video attachment. The video you have sent in is acceptable showing the VIN and engine seized.

I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job.

If heads are warped I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly, thank you.

lifted vehicle saw coolant leaking from heater hoses. to confirm leak I pressurized coolant system to 20 psi and saw coolant leaking from heater hoses. replaced heater hoses and burp system for almost two days and still have air coming out while burping vehicle. so I tilted vehicle on lift for several hours to burp and still have a lot of air while burping. I drove vehicle for several miles during test drive and heat goes away. only have heat when sitting at idle while pressing gas. I pressurized system again and is slowly losing pressure no leaks present. please advise

*** Web - Advice created on 03/06/2020 10:45:43 and created by Juan Vazquez ***
1: We will need to tear down the engine.

Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs

make sure none of the head bolts are stripped or loose, specially near the affected leakage of the head gasket.

Please also check for metal in the ocv's.

If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts with block aluminum treads if they will not hold, then I will approve the PWA case for the short block replacement.

Good Morning, today I find myself with this vehicle, seems after I installed a differential , they seem to drive the doors off it, well maybe not, LOL, seems there oil in the antifreeze,
and antifreeze in the oil. there's no complainant of over heating, just an oil leak. and seems the pressure from the cooling system just blew oil out of the jug down the side of the
engine compartment.

*** 03/09/2020 05:21:41 ***
Web - Diagnostics created on 03/09/2020 05:21:41 and created by Mark Novak
visual check no leaks, seems to run ok, I did not drive it down the road , just into the shop. what will you need to inspect, with antifreeze in the oil, the engine is toasted// correct?

1: hello Terry
Thank you based on this information the engine will need to be replaced
I have generated a PWA case for you; Based on the information you have provided,
I recommend that you replace the engine following normal service procedures.
Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

1: Thank you for the attachments. The attachments you have sent in is acceptable showing engine block failure.

I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures.

Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job.

If heads are warped I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly, thank you.

2: For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Please refer to service info and TSB ENG083

*** Web - Advice created on 03/17/2020 11:09:30 and created by Brian Hernandez ***
1: I do agree that engine replacement will be necessary but due to the damage, it won't be covered under warranty since it was not due to a manufacture defect.

Before proceeding with replacement, we will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the OCV's. If either of these two items has failed inspection, please let me

know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** Web - Advice created on 03/17/2020 11:10:51 and created by Brian Hernandez ***
2: Sorry, typo at the end of that last comment. PWA can not be approved due to outside influence.

customer traded in vehicle with a blown head gasket

*** 03/17/2020 13:17:49 ***
Web - Diagnostics created on 03/17/2020 13:16:33 and created by KEITH MULLIKIN
appears that the front bank was bad, head bolt threads coming out of block on 12 of 16 head bolts. no lower end engine noises, vehicle still ran but with a miss. We have contacted a machine shop about installing thread inserts in the block for the head bolts. I have disassembled the engine and checked connecting rod bearings, clearances appear ok between .0015-.002 on plastigage. I was concerned if the dark color of the bearings would be anything to worry about, I am attaching a picture.

1: Hello Keaton
1, Please perform the Block Test inspection, please use this method, with the vehicle fully warmed up, test drive the vehicle again and perform a couple hard accelerations and then when the vehicle is back in the service bay remove the cap from the coolant recovery tank and immediately test the air inside the recover tank, Please report your findings
if it fails then
2, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

Customer states that there is an oil leak coming from the vehicle after engine replacement

*** 03/19/2020 13:08:51 ***
Web - Diagnostics created on 03/19/2020 13:08:51 and created by Jason Church
Verified concern. I have added dye, cleaned the affected area, and the customer drove the vehicle. Upon return of vehicle it appears that the oil leak is coming from the upper oil pan gasket, front timing cover, and there is oil drips hanging from the back of both cylinder heads. DPSM Ralph McGuire requested that the engine be cleaned and ran in a controlled environment to monitor oil leak. Cleaned affected area and ran engine on lift with the vehicle in the air and in gear running at 50mph. Inspected vehicle after 1 hour and found that there is oil running out from in between where the engine and transmission mate, but cannot see dye when the torque converter access cover is removed. There is also dye present at the back of the RH cylinder head forming to a drip. There is also a faint dye line present on the LH cylinder head in between where the head and the block mate. No dye present on the front timing cover as of yet. DPSM requested techline case. I have attached pictures.

1: Jason,

Please use a bore scope and carefully inspect the oil pressure switch for any indication of leaking oil.
Thank you

*** 03/19/2020 14:31:16 ***
Web - Note created on 03/19/2020 14:31:16 and created by Jason Church
I thought the same thing at first but did not see it leaking. I reinspected it again just now and I still do not see any leaks on the switch where the harness connects. I do see a lot of oil pooled up in the cavities between the head and the block on both sides towards the timing cover. It appears to have the dye in. I don't usually see the oil pooling up in those spots with the switch leaking. I have attached pictures

1: Jason,
Thank you for the pictures.
Please access the cylinder head bolts and see if the bolts will retain 60 FT LBS of torque by using a torque wrench.
Thank you and please list the results.

*** 03/23/2020 13:39:27 ***
Web - Note created on 03/23/2020 13:39:27 and created by Jason Church
I have checked the torque on all cylinder head bolts and they all retained 60 ft lbs or torque.

I also removed the oil filter housing and the oil pressure switch housing to inspect the gaskets. I have attached a picture of the oil pressure switch gasket. It looks like it was possible wasn't sealing properly. Not sure though.

Can you see on the previous repair what gaskets were or were not replaced?

1: Jason,
I can't tell by the pictures what is causing the leak. This is something you are going to have to determine since I am not there to personally inspect the vehicle and unfortunately there are not any available FTS'S due to the corona-virus and my be this way for some time.
Thank you

*** 03/25/2020 15:51:53 ***
Web - Note created on 03/25/2020 15:51:52 and created by Jason Church
Alright so I overnighted the oil pressure switch housing and gasket, but when I was starting to reassemble the engine and cleaning the gasket surfaces, I noticed that there was a large amount of silicone in one area and when I removed all the silicone I noticed that the block is missing a chunk. I knew this because I have an old V6 block sitting in the corner from a 14MY sorento.

I have attached 2 photos to the case

customer states oil is leaking from engine and coolant is leaking also temp gauge jumps around from hot to cold

*** 03/20/2020 05:28:49 ***
Web - Diagnostics created on 03/20/2020 05:18:58 and created by hDEREK SCHWADER
visual inspection found oil leak in between engine and transmission leaking down from valley of engine. indicated it was oil pressure switch however oil also coming from cylinder head. found coolant leaking from right hand cylinder head gasket and front cover. while trying to trace source of coolant leak found thick sludge built up in engine. while trying to find cause of coolant leak decided to remove right cylinder head to inspect for damage or cracking on cylinder head or cylinder block. while removing cylinder head found 4 of the 8 head bolts were not torqued down and were only finger tight. after removing all cylinder head bolts found the 4 loose head bolts covered in oil and coolant and sludge. threads in block are filled with oil coolant and sludge and unable to get bolt far enough down in the block. also found 2 of the head bolts pulled threads out of the block and will no longer tighten properly. no dtcs were found in system

1: Chris,
Thank you for the information. I am going to generate a PWA case for shot block replacement per Pitstop 539.
For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector

backup ring & injector washer seal. Refer to ENG083.

1: Thank you for the information and the photos on this case, Mr. Deras. No PWA is needed to replace a head on an engine. Just for a small/long block. One thing I would check before we close the case out is the torque on the head bolts.

We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 03/27/2020 15:15:09 ***

*** Web - Advice created on 04/02/2020 13:50:59 and created by Brian Hernandez ***
1: Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please refer to service info and TSB ENG083

2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

1: Hello Steven
Please remove the cylinder head or heads and inspect for a warped block and or heads by using a precision straight edge , also check for cylinder wall damage, stripped threads in the block for the head bolts please take and attach any pictures of any damage if found and attach it to the case, and if the head or block is warped let me know by how much thank you

1: Thank you for the attachments and information provided. With the information and attachments you have verified this replacement engine has failed.

I have generated and approved a PWA case for you, based on the information you have provided, you are authorized to replace the engine.

NOTE: Be sure to use the same part number as the just failed engine as this will be a parts warranty claim.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083

2: Important: When submitting claim for this case it should only have the short block, head gaskets, head bolts and minimum labor since the engine was not fully assembled or installed

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin All Others

*** Web - Advice created on 04/06/2020 16:50:34 and created by Eric Patterson ***
1: : We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 04/07/2020 15:30:03 ***

1: Thank you Tim

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
3: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

vehicle came in due to it overheating. once inspected found that the engine is making some bottom end noise and that the head gaskets have failed the oil has been mixed with coolant. there is no coolant in the radiator just some in the overflow tank. with something like this happening i know the bottom end will need to be replaced due to oil contamination and the fact that there is bearing noise coming from it. i will need to send the heads out to see if they are warped in any way correct? also with it over heating should all the components in the cyl head be replaced as well or just inspect and replace as needed?

1: Please attach a short video of the VIN then move the camera toward engine compartment on the crankshaft pulley area then to the oil pan. If needed, slowly increase engine RPM to1500. Submit the video to the case.
Drain some oil and attach a photo of the contaminated oil.

Still trying to get to it...sorry for the wait..

*** Web - Advice created on 05/12/2020 08:46:23 and created by George Hall ***
1: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

Engine oil leaking into cylinder block valley.

*** 04/17/2020 11:14:20 ***
Web - Diagnostics created on 04/17/2020 11:14:20 and created by CHRISTOPHER SCHAEFER
I have previously attempted to repair this oil leak by replacing the valve cover gaskets, the oil pressure switch and oil filter housing, and resealing the timing cover. Every time the vehicle would return with the same oil leak.
I finally determined it must be leaking from the cylinder head gaskets. During removal of the cylinder heads, I found the bolt hole threads around one of the cylinder head bolts of cylinder #1 had pulled from the block, and that headbolt was no longer clamping the cylinder head properly.
Cylinder block must be replaced.
