vehicle was towed in. c/s oil is leaking just had major engine repairs at another kia dealership.

*** 04/30/2020 11:41:31 ***
Web - Diagnostics created on 04/30/2020 11:41:31 and created by Noe Muniz
verified concern. there was an oil leak. at first suspected the oil was leaking from the head gasket from cylinder closes to fire wall, there was oil dripping down from the head gasket area. had to remove the intake manifold along with the injectors to further inspect location of oil leak. found the oil filter housing was leaking therefore oil was dripping along the cylinder head area making it look as if the head gasket was leaking. replaced the oil filter housing put the vehicle back together. test drove vehicle 10 miles re inspected vehicle for leaks no leaks found releasing vehicle back to customer.

Web - Problem Description created on 04/30/2020 11:42:46 and created by David Weaver
Vehicle is smoking badly (white smoke) and barely running.
Backstory - just so you know what's going on. The vehicle is out of warranty and we told the customer it has a blown head gasket at least but I think it's going to need a block due to the bolts having pulled the threads out of the block. I did not disassemble engine to verify but it's a commen issue that's been happening. So the customer started a consumer affairs case and now the Dpsm and service manager wanted me to start this PWA.

*** 04/30/2020 11:43:26 ***
Web - Diagnostics created on 04/30/2020 11:42:47 and created by David Weaver
Vehicle was down coolant. Performed block test and test failed there IS combustion gas in the coolent passages. Dpsm wanted me to remove valve cover and take pictures for maintenance verification. Engine is clean. Pictures will be uploaded along with pictures of leaks across rear cylinder head.

*** 04/30/2020 11:43:28 ***

*** Web - Advice created on 04/30/2020 11:54:23 and created by Juan Vazquez ***
1: Thank you for information and attachments, attachments shows coolant leaking from head gasket.

We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts with block aluminum treads if they will not hold.

At this point this vehicle is out of warranty, be sure to get customers authorization before repairs, thank you.

*** 05/14/2020 08:58:42 ***
Web - Note created on 05/14/2020 08:58:42 and created by David Weaver
Attached photo of bolts on rear head. 4 bolts where loose and would not tighten down. Removed bolts and the threads from the block came with them.

*** 05/14/2020 08:58:45 ***

customer states vehicle overheated and smelled coolant.

*** 05/04/2020 14:51:07 ***
Web - Diagnostics created on 05/04/2020 14:51:06 and created by Justin Burgess
upon original inspection found that the coolant would reach over 212 degrees farenheit.
the fans were operational and was low on coolant due to it boiling out of the overflow tank.
upon inspectiong of thermostat it was melted in the center were its rubber seals are built into it.
replace thermostat and test drove car.
vehicle continued to overheat and boil out of the overflow tank.
water pump is spinning, the temperature gauge reads properly and each time the system is burped.
gases now expelling from radiator when cap is opened and coolant turning a faded brown color.
upon accelerating with the radiator cap off an excessive amount of combustion gasses are forcing coolant to explode out of the radiator.
I believe the head gasket(s) and or cylinder head(s) to be damaged.
writing this case to see in which way you would like me to continue.

no visible exterior leaks at the block/head indicating coolant leak.
the block test would not change color on tests however i pulled all six plugs and noticed that cylinder #1 in the back left was the only clean plug.
I scoped that cylinder and you can see very small drops running from the head gasket seal down into the block while the system was pressurized.
i am attaching the best picture of the scope i could find as well as the plugs.

1: Thank you for the video attachment. The video you have sent in is acceptable showing the VIN and engine block damage.

I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly, thank you.

*** Web - Advice created on 04/30/2020 12:16:38 and created by John Nguyen ***
1: Jesse, please provide a 10 minute flight recording with all PCM data for review. Thanks.

*** Web - Advice created on 04/30/2020 12:27:46 and created by John Nguyen ***
1: Tech called in to discuss this case and stated that the engine does not run so he can not perform an engine block test and a flight recording.
2: Jesse I will need to run this by my lead. Please standby for a response.

*** Web - Advice created on 04/30/2020 13:30:43 and created by John Nguyen ***
1: Jesse, after some review with my supervisor he has verified some discrepancies with your readings. Please perform the dry and wet compression tests again and perform the cylinder leakdown test again. Please try another compression gauge to rule out the factor of a faulty compression gauge. Thanks.

*** Web - Advice created on 04/30/2020 13:34:51 and created by John Nguyen ***
1: Please also use a battery booster when cranking the engine during the tests. If you need assistance please seek your shop foreman to assist.

*** 04/30/2020 14:31:45 ***

Web - Note created on 04/30/2020 14:31:45 and created by Jesse Quintana
Used a different compression gauge and found one through six were between 200-210psi performed cylinder leak down test and the results are the same

*** Web - Advice created on 04/30/2020 14:42:29 and created by John Nguyen ***
1: Jesse according to your compression readings this does not sound like an engine concern. Please check for proper fuel quality by performing fuel test as outlined in KGIS under TB006. Please also inspect GDI pump fuel pressure and view injector pulse width.
2: Please also remove spark plugs and provide a picture of their condition to the case.

*** Phone - Advice created on 04/30/2020 14:53:50 and created by Juan Vazquez ***
1: Tech called, unable to hear anything, technician ended call

*** Web - Advice created on 04/30/2020 15:04:20 and created by John Nguyen ***
1: Technician called in to discuss this case. He stated that he does not think that fuel is a factor. He stated that engine oil was found in the intake manifold and causing the misfire. Tech feels the oil may be leaking past the valves.
2: Jesse if you feel that oil is leaking past the valves then there will be a percentage of cylinder leakdown. Please perform the cylinder leakdown test again and provide a picture of the gauge to the case for documentation.

*** Web - Advice created on 04/30/2020 15:28:52 and created by John Nguyen ***
1: Jesse was the intake replaced with the last engine replacement or was it reused?

*** 04/30/2020 15:54:37 ***
Web - Note created on 04/30/2020 15:54:37 and created by Jesse Quintana
intake manifold was reused

*** Web - Advice created on 04/30/2020 16:25:12 and created by John Nguyen ***
1: Jesse, thank you for the cylinder leak down test results. Please perform the compression test again using a known good compression gauge. Please provide a continuous video of the test being performed on each cylinder and include a clear view of the VIN. Please repeat this for all six cylinders to verify that you have good compression.

*** Web - Advice created on 05/01/2020 09:25:40 and created by Gino Leon ***
Jesse, was this a long block or short block that was replaced? Check the timing chains. Usually if there is a misfire on the one bank 2,4,6, the timing jumped. Since the vehicle wont stay running. Need to check the basics. Fuel, spark, compression. also worst case scenario, the threads for the cylinder head bolts in the block stripped. Check them with a torque wrench.

*** Web - Advice created on 05/18/2020 11:42:05 and created by Frank Lusic ***
1: I called Ruben and we discussed the case and how the oil level was still full and is this was oil smoke the oil level would be low Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 05/19/2020 10:46:48 ***

VEHICLE CAME IN FOR A OVER HEATING CONCERN. LIFTED VEHICLE AND FOUND OBVIOUS SIGNS THAT THE HEAD GASKETS HAVE BLOWN. CUSTOMER GOT WITH THERE EXTENDED WARRANTY COMPANY AND GOT THE APPROVAL TO REPLACE THE SHORT BLOCK IF THE HEADS WERE GOOD AND THEY WERE. SO I REPLACED THE SHORT BLOCK PUT THE VEHICLE ALL BACK TOGETHER ADDED OIL AND COOLANT. VEHICLE RAN ON MY RACK FOR HOURS BURPING THE COOLANT SYSTEM, PULLED IT OUTSIDE TO WORK ON SOMETHING ELSE. AFTER A FEW HOURS BROUGHT THE VEHICLE BACK IN AND NOTICED A KNOCK COMING FROM THE BOTTOM END, NOT EVEN 5 MINS LATER THE KNOCK GOT A LOT WORSE. I'M GUESSING THIS WILL BE PARTS WARRANTY MY SERVICE MANAGER JUST WANTED ME TO LET YOU KNOW OF THE SITUATION. THANK YOU

1: Thank you for that information. Yes if this block is defective, repair will be as parts warranty.

Please verify that original repair order is closed and invoiced, and attach all copies to this case.

Attach a short video showing VIN and engine knock.

Attach a photo of the engine reman blue tag, the serial number has to be clearly visible.

1: Thanks for the pictures. I can see what looks like some residue on the head and block in the head gasket area but I cannot see a clear source of any leak. If you clean that area and run the engine can you verify it is leaking? I did not see any metal on the OCV but the condition of the spark plugs indicates there is likely oil burning and that could be the cause of the misfire. Is the leak on bank 1 or bank 2?

*** 06/01/2020 08:12:16 ***

Case Number: XXXXXXXX Reopen Requested by Wilbert Lim.
Reason: [After replacing short block and faulty timing chain tensioner, still have same code P0300 active, P0302 pending, P0304 and P0306 history. So, then we replaced both timing chains and gears on a the crankshaft, but then still has same exact issue. Therefore, we went to do a further diagnosed did Oscilloscope normal, did power and ground from coils, spark plugs, OCV Ohm still same. So, then I did fuel pressure that has a reading of 450 to 300 kpa which kind of low and vacuum test that has a reading of 22 inch of mecury, did a snap for 4000 rpm it goes to 25 and back to 22; thereafter we swapped IDB, Fuel Pressure Pump from a known good one and even replaced a brand new CPU and still have same issue.]

Web - Problem Description created on 05/29/2020 14:04:44 and created by Mark Novak
hello,
I'm just getting back to this ,my cylinder heads came back this week, today I was putting the heads back on.
before I even got to the first 90 degrees of the 118-122 turn I could fell two of the bolts loose clamping force/tension, I went ahead and finished the procedure, but on those bolts I'm confidant, they have pulled out of the block, Not totally, but they are loose. and others seems" TOO TIGHT" a lot of effort to complete the turn's/angles, as if they bottomed out.
There is something wrong with the threads in those holes, I have only done one head the other is still off,
What is the call on this??

*** 05/29/2020 14:08:46 ***
Web - Diagnostics created on 05/29/2020 14:04:44 and created by Mark Novak
reassembly trouble loose/ worn/ threads in cylinder head bolt holes
new bolts gaskets
all according to kgis/pitstops.

1: Hello Mitch
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 06/15/2020 08:50:29 ***

*** Web - Advice created on 05/29/2020 11:03:11 and created by Chris Schang ***
1: Jose,
We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

oil in coolant system

*** 06/22/2020 11:10:33 ***
Web - Diagnostics created on 06/22/2020 11:10:32 and created by jessy willingham
customer states after repairs were done a couple months ago there is oil mixing with the coolant. i have tried to flush out the oil but there is just so much in the coolant system that i cant get it all out the radiator hoses have swollen from oil deteriorating them. the engine runs good with no misfires and i have not got it to run hot, im assuming some one has put oil in the coolant reservoir and when the engine needed more coolant it sucked it in through the tank because when it got here the reservoir was full of used engine oil that didnt look contaminated with coolant yet

but there is no coolant mixing with the oil, oil level is full and not contaminated but the coolant is contaminated with oil

*** Web - Advice created on 06/22/2020 12:15:04 and created by Juan Vazquez ***
1: Thank you for that information. Two questions.

1. Was there any oil in the coolant last time the vehicle was in for engine repairs?

2. Can this be transmission fluid in the cooling system?

*** 06/22/2020 12:21:29 ***

Web - Note created on 06/22/2020 12:21:29 and created by jessy willingham
well im not sure because this car is from alaska and im not sure where the engine repairs were done because this is the first time this car has been to this dealership in alabama.
to me it looked like used motor oil in the reservoir and smelled like oil as well. i dont think i will be able to flush all of it out of the system because the oil is gunked up in the radiator fins

*** Web - Advice created on 06/22/2020 15:26:39 and created by Juan Vazquez ***
1: Thank you for that information. Have you been able to determine where the oil came from?

Please attach photos showing contaminated coolant, also pressurize cooling system and see if it losses pressure.

*** 06/23/2020 05:58:36 ***
Web - Note created on 06/23/2020 05:58:35 and created by jessy willingham
im not 100 percent sure where the oil came from at this time, it seems like the more i flush the coolant is getting cleaner and cleaner but theres just so much gunk from mixing its sticking to everything and its hard to get it all out i will pressurize the system and let you know but pics are sent

1: Thank you for the attachments. The attachments are acceptable showing the engine knock needs to be replaced due to treads coming out of block.

I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly, thank you.

2: For GDI Engines handling and service procedures, please refer to service info and TSB ENG083

Customer states their car is burning through a lot of oil. Has to keep adding oil in between oil changes. After further looking over the vehicle I found that the head gaskets are slowly leaking oil. We have approval for tear down from customer but want to make sure we are covered for any parts when removing the head bolts if any of them are stripped on the way out. Let us know how you would like us to proceed.

1: Austin,

I don't see a significant oil leak that would cause this type of an oil consumption concern.

Please thoroughly inspect the PCV system for any restrictions. Plugged up PCV valve (Make sure the PCV valve rattles when you shake it) Pinched or plugged up PCV hose or breather hose. “Check to see if the port in the valve cover is plugged up” as this is part of the PCV system.
Thank you

Please provide a clear picture of the spark plug electrodes for review.
Thank you

Web - Problem Description created on 06/30/2020 10:37:25 and created by Jason Buder
i had previously open a case for this vehicle when having issues with the reman short blocks (case# 13616214) the issue was after INSTALLING the cylinder heads onto the new short block the one of the cylinder head bolt holes didnt have enough threads in the block and the head bolt just striped when applying my first sequence of torque. if you refer to previous case i was told damage identified prior to being installed on the vehicle should be returned following MPA policy and create a return request through Web DCS. No techline pwa required.

*** 06/30/2020 10:39:52 ***
Web - Diagnostics created on 06/30/2020 10:37:25 and created by Jason Buder
the issue is we cant get the claim paid due to the fact that i had already installed the cylinder heads to the new short block then found the damage. so we can't claim it as a parts warranty return

*** 06/30/2020 12:01:47 ***

*** Web - Advice created on 06/30/2020 12:11:01 and created by Brian Lall ***
1: Jason, thanks for letting me know what happened. I reviewed the previous case where it was stated "Damage identified prior to being installed on the vehicle should be returned following MPA policy and create a return request through Web DCS. No Techline PWA is required." That was incorrect, since the head was installed you did need a PWA. Has the repair already been completed and has this vehicle been returned to the customer?

*** 06/30/2020 12:13:46 ***
Web - Note created on 06/30/2020 12:13:46 and created by Jason Buder
yes the repair has been complete and the vehicle was returned to the customer

*** Web - Advice created on 06/30/2020 13:42:46 and created by Brian Lall ***

1: I am going to have this case reviewed by the Techline manager to find out how to proceed. I will update the case when I get a response. Thanks.

1: Thanks for the photos. Is there any metal debris on the OCV screens? If not, please check to see if any of the head bolt threads have pulled out of the block.

*** 07/03/2020 09:41:17 ***
Web - Note created on 07/03/2020 09:41:16 and created by Jerry Sheppard
I removed the ocvs and there is no metal in the screens. Attached photos. Removed the valve covers, timing cover a timing chains and cam shafts. Checked the cylinder head bolts and found some are not very tight on the rear head. I removed one that was not tight and it has the threads pulled out of the block. The one next to it was very loose and when trying to remove would not come out got bound up and finally broke. photos attached.

1: Rodney,
We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Your DPSM can approve the labor time for this.

*** 07/15/2020 13:51:33 ***
Web - Note created on 07/15/2020 13:51:33 and created by Rodney Ledet
Okay, I have checked the head bolts and the corner bolt on the left cylinder head, above leak, is loose and will not tighten up. The threads in the block are stripped out of one bolt hole.

*** Web - Advice created on 07/15/2020 14:59:26 and created by Chris Schang ***
1: Thanks Rodney,

1: Thank you for the video in the case.

Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
3: Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and

make sure all the check balls are installed in the oil galleys as well.

2: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Thank you,
If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

1: Thank you for that information. Please verify cooling system components are operating as designed (cooling fan, hoses, clamps thermostat, radiator).

If components are OK, then I recommend removing the heads to inspect head gaskets,

NOTE: before removing head bolts, you need to first torque them down to 75 ft lbs and make sure none of the head bolts are stripped or loose. If any of the bolts are stripped, please let me know before continuing.

Please add picture of the stripped bolts with block aluminum treads if they will not hold, then I will approve the PWA case for the short block replacement.

1: Thank you for the attachments. The attachments you have sent in are acceptable showing the VIN and stripped block treads.

I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly, thank you.

2: For GDI Engines handling and service procedures, please refer to service info and TSB ENG083

1: Thank you for the information.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 08/10/2020 06:10:35 ***
Web - Note created on 08/10/2020 06:10:35 and created by Justus Bjurstrom
Ocv does not have metal in it, and the two right front bolts are stripped, can easily br turned by hand, attached video of ocv, valvetrain and bolt spinning in place. Thanks

Customer states vehicle engine started shaking and check engine light didplayed.

*** 08/03/2020 10:23:04 ***
Web - Diagnostics created on 08/03/2020 10:23:04 and created by Jose Lira
Car had dead battery and has to jump start and started but their was no engine light present. Notice clear white smoke coming out the exhaust pipe. Test drove car around the block and drove good till i got to the shop the car over heated to high. Coolant reservoir was at full before test drive and after was over full and leaking and u can see lots of bubbles was coming out from radiator. Car has a head gasket leak and can see exhaust fume coming out from cooling system.

1: Thank you

Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.

If there is and it looks like it will please see line 2
2: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 08/05/2020 09:42:08 ***

Web - Note created on 08/05/2020 09:42:08 and created by Jose Lira
Found no coolant leaks at all only small oil leak from timing cover. Clear white smoke coming from exhaust pipe and can see coolant reservoir overfilled and bubbling from exhaust fumes coming out head gasket to the cooling system.

*** Web - Advice created on 08/17/2020 08:49:28 and created by Eric Patterson ***
1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

*** Web - Advice created on 08/18/2020 15:25:18 and created by Juan Vazquez ***
1: Thank you for the attachment. It shows the block treads for the head bolt have come off and engine replacement is necessary.

I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly, thank you.

2: For GDI Engines handling and service procedures, please refer to service info and TSB ENG083

1: Darnell, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications. If you find any damage please provide a continuous video of the stripped threads and include a clear view of the VIN. Please report your findings

*** 08/22/2020 05:38:29 ***

1: Lawrence,
Can you please perform a block test to confirm if there are any exhaust gasses in the cooling system?

*** 08/20/2020 11:09:45 ***
Web - Note created on 08/20/2020 11:09:45 and created by lawrence ellison
Performance engine block test fluid turned yellow which indicate combustion leak is on the exhaust side there is no oil and coolant mixture also smoke steam admitting from tailpipe with smell of coolant

*** Web - Advice created on 08/20/2020 13:16:17 and created by Chris Schang ***
1: Lawrence,
We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

*** 08/25/2020 06:46:32 ***
Web - Note created on 08/25/2020 06:46:31 and created by lawrence ellison
Remove and inspect oil control valve no metal on screen, nor metal in oil when drained oil for metal or coolant inspection. Head bolts on back side of engine, (cylinder head 1)head bolts were loose and also stripped out when attempted to torque bolts. Need to know what is the next step, also was wondering if the front side of head needs to be inspected as well for any issues concerning that head (cylinder 2)

*** Web - Advice created on 08/13/2020 16:07:45 and created by John Nguyen ***
1: Darcy, Rob, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications. If you find any damage please provide a continuous video of the stripped threads and include a clear view of the VIN. Please report your findings

*** 09/17/2020 14:45:59 ***
Web - Diagnostics created on 09/17/2020 14:45:59 and created by Souta Saephan
Verified customer's concern, the engine is overheating. Noticed the coolant in the reservoir is above the full mark and radiator cap is brand new. I checked the head gaskets and found bank 2 is leaking coolant from which looks like cylinder 4. I attached pictures of the leak coming from the head gasket on bank 2. I had a couple of these engines with the head bolts being loose or stripped out causing the leak.

1: Thank you for the information on the case and the photo attachment. I can see the trail of coolant residue on the side of the block from the gasket. I think you're going in the right direction with the head bolts.

We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 09/18/2020 09:25:14 ***
Web - Note created on 09/18/2020 09:25:14 and created by Souta Saephan
I removed the camshafts on bank 2 then checked all the head bolts and had 4 of them loose. Cylinder 4 area head bolts were loose and 1 of the bolts had coolant on it when i pulled it out. I attached some photos of the head bolts and the torque readings I got.

Web - Problem Description created on 09/18/2020 07:42:20 and created by Ramon Santiano
Three cylinder head bolts are not tight and will not tighten because the threads in the cylinder block are stripped. The job was originally for head gasket replacement because of internal coolant leak. When removing the cylinder heads, bank 1 cylinder head bolts (3 of them) were not tight.

*** 09/18/2020 07:47:34 ***
Web - Diagnostics created on 09/18/2020 07:42:20 and created by Ramon Santiano
Performed coolant block test. It failed and determined it was from the head gasket. Removed cylinder head and found three head bolts to be loose. Upon inspection, found that the threads in the cylinder block are stripped.

*** Web - Advice created on 09/18/2020 08:30:16 and created by Juan Vazquez ***
1: Thank you for the video attachment. The video you have sent in is acceptable showing the cylinder block treads have come out and engine needs replacement.

I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use

Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083

Thank you.

*** Web - Advice created on 10/12/2020 12:00:06 and created by Frank Lusic ***
1: Hello Chris
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

Web - Problem Description created on 10/14/2020 09:34:23 and created by Arnold Corpuz
customer states engine over heated & will not restart.

*** 10/14/2020 09:40:39 ***
Web - Diagnostics created on 10/14/2020 09:34:23 and created by Arnold Corpuz
Checked for dtc's & none found. Engine cranks over but will not start. While cranking engine over i found coolant reservoir bubbling up. Checked for coolant mixing with inside engine & none present.. Removed radiator cap & found radiator is empty. Refilled radiator & pressure tested cooling system & found small coolant leaking at bank 1/ right side of engine at the cylinder head. Please advise. Thank you.

*** 10/14/2020 12:18:08 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin Everyday Cases

*** Web - Advice created on 10/14/2020 12:20:51 and created by Chris Schang ***
1: Arnold,
We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 80 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.

*** 10/23/2020 10:44:10 ***
Web - Note created on 10/23/2020 10:44:10 and created by Arnold Corpuz
I found 6 out of the 8 head bolts are loose at right side cylinder head (bank1) & 2 out of the 6 loose head bolts are stripped. No metal found at intake & exhaust OCV(bank1). Please advise. Thank you.

*** Web - Advice created on 10/23/2020 12:54:57 and created by Chris Schang ***
1: Arnold,

Can you check with your parts department and see if there is a long block available?

*** 10/23/2020 14:06:08 ***
Web - Note created on 10/23/2020 14:06:07 and created by Arnold Corpuz
There is an active part number for a long block, however there is none available in the warehouses. Please advise. Thank you.

*** Web - Advice created on 10/23/2020 14:51:17 and created by Chris Schang ***
1: Arnold,
The heads will need to be removed to be inspected for warping. We already know that we will be replacing the block for damaged threads but we need to tear down to determine the extent of the repair.

*** 10/27/2020 05:56:53 ***
Web - Note created on 10/27/2020 05:56:53 and created by Arnold Corpuz
yes middle of both cylinder heads are warped (more than 0.05mm). Please advise. Thank you.

*** Web - Advice created on 10/27/2020 07:03:33 and created by Chris Schang ***
1: Arnold,
I will generate a PWA for the short block as I believe that the long block is discontinued. You will also have to replace the heads. Thanks.

I have generated and approved a PWA case for you.

*** 12/10/2020 07:30:04 ***
Case Number: XXXXXXXX Reopen Requested by Arnold Corpuz.
Reason: [after replacing short block and got everything back together engine was running fine. I let run for 30 mins, then took it out for a good road test & ran great until about 3 mile into the road test. While on road test after about 3 miles MIL lite came on started flashing & vehicle did not want to pass 20 to 30mph & felt like it was misfiring. Then I shut off the engine & restart engine ran fine & got it back to the shop. While on road test back to the shop I was watching data analysis & found that the fuel- high pressure desired & sensor signal would dropped down around 80 psi & that's when the vehicle starts to act up & will not go pass 30mph. Then the desired & high pressure sensor signal jumps back around 1300 psi & engine starts to run fine again. I wasn't able to record dtc at the time but it was for low fuel rail pressure. Got back to the shop started diag & found high pressure fuel pump was the issue. So I parked vehicle outside & I order new high pressure pump. Next day I drove vehicle in the shop then replaced high pressure fuel pump & when I tried to start engine it would crank but not start. So while cranking the engine over I was watching data analysis & found that the desired & high pressure sensor signal is around 1100 to 1300 psi. So now I know that the high pressure fuel is working & engine is getting fuel. Performed diag & found that now I have NO SPARK. Checked for dtc's & none present. Checked all fuses & all checks out fine. Please advise. Thank you.]

*** 12/10/2020 07:34:03 ***
Reopen Denied by Chris Schang
Reason: arnold this is a seperate concern and you will need to open a new case

1: Perform normal mechanical, electrical and fuel system inspections for misfires and test fuel quality per TB006. Check fuel trims; test the fuel sample for quality (color, smell). For quality, it should have a strong fuel smell, and a clear yellowish color. Burn a small amount by smearing a few drops into a metal pan and see if you have an oily residue left over. If no problems are found, remove the plugs and check for signs of porcelain cracking or carbon tracking.

1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

1: Thank you
It is hard to tell but I hear what sounds like a possible loose timing chain and valve train noises

1, check the timing chains to see if they are loose , by using the crank bolt and rotating the crank backwards while checking for chain slack between the cam gears
2, remove the valve cover, check the valve clearance , If any are loose remove the cam and cam follower , check the contact area on the bottom side of the cam follower for wear marks,

call me if you need a better explanation on Monday

*** 11/17/2020 07:39:18 ***
Web - Note created on 11/17/2020 07:39:18 and created by Jesse Tomlinson
Removed front valve cover, checked timing chain tension, tension seem good and tight, no excess slack. Started to perform valve clearance test, and found cylinder 6, one of the exhaust valves furthest right, the spring seems to have collapsed, or the valve is stuck in the downward most position with the cam not touching it at all. used borescope in spark plug hole on #6, possible damage to piston was seen.

*** Web - Advice created on 11/17/2020 07:53:48 and created by Frank Lusic ***
1: Based on this information the cylinder head will need to be removed for inspection of the piston top
but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 11/17/2020 15:05:58 ***
Web - Note created on 11/17/2020 15:05:58 and created by Jesse Tomlinson
torn down and removed cams and checked head bolts, 3 out of 8 were a little looser then the rest, on torqueing them back down they were very hard to bring to the last 90 degrees on the second angle pass, but no threads pulled. I did find the bucket on the affected vale looks to be damaged where it contacts the valve itself. I do not see any damage to the piston.

*** Web - Advice created on 11/18/2020 05:54:15 and created by Frank Lusic ***
1: Thanks for checking, please have the cylinder head repaired and reinstall on the motor

1: Thank you for the information and video attachment. We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head.

If unable to torque the head bolts because they are striped, then attach photos of the stripped bolts with block aluminum treads, then I will approve a PWA case for the short block replacement, thank you.

*** 11/13/2020 08:09:07 ***

*** Phone - Advice created on 11/13/2020 11:00:53 and created by Juan Vazquez ***
1: Thank you Felipe for the phone call and for the video attachment. The video you have sent in is acceptable showing the cylinder block treads have come out and engine needs replacement.

I have generated and approved a PWA case for you. Based on the information you have provided; you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly.

When repairs are completed, fill crankcase with the proper amount of oil. Recommended Product: QUARTZ 9000 FUTURE FGC 5W-30 Full Synthetic SN PLUS, QUARTZ 9000 FUTURE XT 5W30 Full Synthetic SN PLUS,

Mobil Super Synthetic 5W30 or above.

If not available, use other brand 5W30 and Full synthetic type with API SN/SN+/SP, ILSAC GF4/GF5 or higher service grade.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083 Thank you.

1: Hello Curtis
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 11/23/2020 09:09:03 ***
Web - Note created on 11/23/2020 09:09:02 and created by CURTIS WHITT
checked the threads in the block and found that the vehicles front head (which consist of cylinders 2,4,6) has a stripped head bolt/ stripped block. it is the bottom row (closest to the front) bolt #2. the bolt just spins and does not tighten down

*** Web - Advice created on 11/23/2020 11:17:05 and created by Frank Lusic ***
1: Based on the information you have provided, you are authorized to replace the engine following normal service procedures.
Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
Catastrophic Engine Failure: e.g., rod through block, large metal debris in pan, or seized engine
Please refer to Pitstops PS539 and PS213 Fill crankcase with the proper amount of oil. Recommended Product: QUARTZ 9000 FUTURE FGC 5W-30 Full Synthetic SN PLUS, QUARTZ 9000 FUTURE XT 5W30 Full Synthetic SN PLUS,
Mobil Super Synthetic 5W30 or above.
If not available, use other brand 5W30 and Full synthetic type with API SN/SN+/SP, ILSAC GF4/GF5 or higher service grade

1: John,
Please access the cylinder head bolts and see if the bolts will retain 60 FT LBS of torque by using a torque wrench.
Please list the results when done. Thank you.

*** 11/24/2020 06:59:52 ***
Web - Note created on 11/24/2020 06:59:52 and created by John Fox
checked torque on head bolts. 3 bolts from the front bank did not hold the 60 ft lbs.

*** Web - Advice created on 11/24/2020 08:00:04 and created by Jerry Gossling ***
1: John,
Based off of your information, the short block will need to be replaced and the cylinder heads check for warpage by using a machinist straight edge.
NOTE, if one of the cylinder heads is found to be warped beyond spec's you will need to replace the cylinder head as its

against Kia's policy to resurface the cylinder heads.
Thank you

*** 11/24/2020 15:31:29 ***
Web - Note created on 11/24/2020 15:31:28 and created by Preston Valdez
at this time short block is on order. awaiting parts arrival prior to further teardown to check cylinder head and deck warpage.

1: Thank you for the videos and picture of the block test. I can see the color of the fluid changed there. We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please refer to service info and TSB ENG083.
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

*** Web - Advice created on 12/02/2020 10:34:00 and created by Brian Hernandez ***
1: I have validated your concern. Please use the Create PWA Case tab that I have enabled and provide all the required information for final review.

The engine diagnosis portion still needs to be completed to complete authorization(only available in a PWA case). I would recommend to open PWA cases when you are requesting engine replacement. This will prevent any further delays in approvals.
Thank you.

Web - Note created on 12/15/2020 11:43:52 and created by DEVIN MITCHELL
I've pulled everything apart and found that 5 of the bolts on the left head are excessively stripped and 3 on the right head. The cooling fan does actuate. It looks as if It had a water pump leak at one point.

1: Thank you for the pictures attached.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with

all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Fill crankcase with the proper amount of oil. Recommended Product: QUARTZ 9000 FUTURE FGC 5W-30 Full Synthetic SN PLUS, QUARTZ 9000 FUTURE XT 5W30 Full Synthetic SN PLUS, Mobil Super Synthetic 5W30 or above. If not available, use other brand 5W30 and Full synthetic type with API SN/SN+/SP, ILSAC GF4/GF5 or higher service grade

Web - Problem Description created on 12/18/2020 14:02:35 and created by Tony Lencowski
Customer states that while driving, vehicle started making a chirping noise followed by a cloud of white smoke from rear. vehicle stalled, possibly overheated, customer noticed coolant leaking under vehicle.

Vehicle had engine replaced previously, short block and head assemblies.

*** 12/18/2020 14:12:36 ***
Web - Diagnostics created on 12/18/2020 14:02:36 and created by Tony Lencowski
Started vehicle, slight knocking noise heard at around 1200 rpm from rear of engine. Massive amount of white smoke coming from exhaust. once in the shop, using coolant pressure tester, set to 16 psi, found rear head gasket to be leaking externally. (see attached video.) Coolant is also mixing with oil, oil is very milky consistancy. (see attached photo.) engine does have a slight knock from rear of engine. (see attached video.) as coolant is coming out of rear cylinder head gasket area, suspect cylinder 3 or 5 to be knocking. I am going to remove the intake and spark plugs to check rear cylinders.

1: Hi Tony,
2: Was engine installed seed engine or reman engine? Please send a picture of the BLUE tag on block if reman engine.

*** 12/21/2020 07:09:49 ***

Web - Note created on 12/21/2020 07:09:49 and created by Tony Lencowski
I see no blue tag over the engine serial number, which is where the service information says the tag would be. Unless I am mistaken, but it does not seem to be a remanufactured engine.

*** Web - Advice created on 12/21/2020 09:38:38 and created by Aldo Parada ***
1: So was this engine a seed engine, long or short block? Please check with parts if this was SEED OR REMAN>

*** Phone - Advice created on 12/21/2020 11:55:45 and created by Brian Hernandez ***
1: Tony called in for an update. He advised that parts checked in on the engine's part number and mentioned that just because it has an R at the end of the part number might not mean that it is a Reman engine. They called the parts hotline and the hotline said they would check in with the engine reman department and get back to them. I advised Tony that if there isn't a blue tag then to add a picture of the serial number of the block near the starter to the case for review. I can reach out to Aldo and see if that would be helpful in moving forward with the case.

*** 12/21/2020 11:59:33 ***
Web - Note created on 12/21/2020 11:59:33 and created by Tony Lencowski
I installed a short block engine last time it was in. I have attached a photo of current serial number on engine. I also took information from previous RO. It is listed as a REMAN engine by part number. I had my parts department call Kia to verify it was not a SEED engine, I am waiting on them to call back after they talk to reman department.
Original repair, I had to build an engine, using a short block assembly, new heads, new front cover, new cam shafts, timing components, oil pans. Everything about this engine is new, I had to build it.

By part number, it pulls up a Reman short block.

Hello Techline, have a 2019 Sorento that has come with coolant lose. Customer stated that could smell coolant. I checked to level and found none in the reservoir. Removed rad cap and found coolant to top of neck. Pressure tested and in approx 10 min went from 17psi to 8 psi. With KDS checked for misfire counts expecting coolant in cylinder. #6 showed 1 and #1 showed 50. with #6 being easiest to get to checked it first. found no real signs of coolant leak. let vehicle do a cold soak and rechecked this mourning. With KDS found #1 had 110 misfires on startup. Removed surge tank and spark plugs to borescoipe. Found #3 still had some coolant on piston and #1 and #5 have signs of steam clean to pistons. Also noticed with the surge tank removed the valves on bank 1 are cleaner than bank 2. Belive have a head gasket starting to fail. Uploaded pics of findings.

*** Web - Advice created on 01/05/2021 11:47:33 and created by Chris Schang ***
1: Josh,
Thank you for all the information up front. This could be a head gasket but this could also be a head bolt issue, same as the older ones. At this time, I would get some labor approval from your DPSM so you get paid to tear down and make sure the head bolts torque down and do not spin.

*** Web - Advice created on 01/07/2021 11:29:49 and created by Andrew Velasco ***
1: Tech called in for Chris. I informed him that Chris is on lunch, but would be back soon. He stated (770) 354-8963 is his personal number.

*** Web - Advice created on 01/07/2021 11:41:10 and created by Chris Schang ***
1: Josh called in,
Tech did not find any head bolts that pulled threads from the block. Tech and agent have agreed that only bank 1 head gasket should be replaced at this time. Tech will get DPSM approval for all necessary components for repair.

1: tech states looses pressure when pressure testing, I will reach to the original agents to discuss this case . And i will close as duplicate

*** Web - Advice created on 04/12/2021 11:24:08 and created by Eric Patterson ***
1: Then please perform a block check and add a short video or a clear picture of the fluid color after the color change please. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.

If there are combustion gasses in the cooling system, Please check the head bolts on the other cylinder head. Then we may need to replace the gasket on the other head.

1: Hello Nicholas
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

Please remove the cylinder head or heads and inspect for a warped block and or heads by using a precision straight edge , also check for cylinder wall damage, stripped threads in the block for the head bolts please take and attach any pictures of any damage if found and attach it to the case, and if the head or block is warped let me know by how much thank you

*** Web - Advice created on 01/06/2021 15:58:13 and created by Eric Patterson ***
1: Based on the information, looks like the head bolts gave way or a major gasket leak. Since the vehicle does have powertrain, lets see if the head gaskets show any signs of failure.

Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.

We are not sure what has caused this but please look closely at the head gaskets.

2: If there is add the pictures and we will need to preform an inspection. See line #3
3: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Thank you
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

3: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

Customer original concern was vehicle was over heating and coolant resevior was bubbling.

*** 01/11/2021 11:20:49 ***
Web - Diagnostics created on 01/11/2021 11:15:00 and created by Derek Wyatt
Performed Block test, dye almost immediately turned yellow verifying a combustion leak. There were also signs of minor coolant residue on rear cylinder head by exhaust manifold. Recommended cylinder head gaskets. Upon cylinder tear down, i noticed no resistance on head "5" (according to process of loosening heads to prevent warping). Was able to remove bolt "5" by hand and block threads came out with it. I have attached a photo of the bolt as well.

1: Hello Derek
I see that the power train warranty has expired
Kia does not recommend that the block be repaired using Time serts
usually the heads and the block are warped when this occurs too

*** 01/11/2021 13:02:37 ***
Web - Note created on 01/11/2021 13:02:37 and created by Derek Wyatt
Good afternoon Frank,

Yes, there is no warranty so this will be customer pay.
I will take measurements on the cylinder heads to see if they are warped and price out block assemblies for the customer then.
Thank you for your input. I figured it would not be recommended for repairs, but wanted to cover all my bases before contacting the customer.

1: A; Thank you Danial
2: B: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 01/20/2021 15:19:28 ***

1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

3: . Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

Web - Problem Description created on 01/21/2021 13:17:45 and created by BRAD REGAN
Lube tech noticed oil that seemed to be leaking from the oil pan and our service advisor recommended he come back for further diagnosis. Upon removing the lower belly cover, I noticed that there was oil seemingly coming out of everywhere. The front cover, oil pan, girdle, and front cylinder head are all leaking to varying extents. I cleaned the engine to the best of my ability and put UV dye into the crankcase. I can see dye seeping out of all the spots previously mentioned. I did a compression test on the first 3 cylinders in front and got 140, 145, and 150 respectively. According to KGIS these are acceptable figures. I also removed the oil fill cap with the engine running to test for excessive crankcase pressure but there was not. I suspect a leaking head gasket causing exhaust gases to be let into the crankcase.

1: Hello Brad
I have never seen a 3.3 head gasket leaking combustion gases into the crank case,
if it was I would think that the engine would have other issues too

are the head gaskets leaking oil externally ? attach pictures if so

also attach pictures of the oil leaks too

*** 01/22/2021 05:36:06 ***

Web - Note created on 01/22/2021 05:36:06 and created by BRAD REGAN
Hello I had my apprentice write this case for me we were bouncing ideas off of each other and the idea of the compression leaking into the crank case is pure speculation not founded in proven fact. The oil leaking externally from the head gasket area is indeed happening. This engine appears to be leaking oil externally from every sealing area. Oil Pan gasket, front head gasket, block to crank reinforcing girdle this seems odd for such a low milage vehicle. I will shoot some photos for you as soon as I get it in on the rack.

1: Thank you Brad for the clarification ,
let's start with the head gasket leaking oil
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 01/22/2021 08:12:40 ***
Web - Note created on 01/22/2021 08:12:40 and created by BRAD REGAN
We attempted to remove the camshafts without removing the front cover or engine but it simply is not possible without jumping time. The only way this is going to be feasible is to remove the entire engine and operate on the ground. Additionally we cannot retorque head bolts as they are torque to yield. We looked into availability of a short block and it seems one is a minimum of 6 weeks out. Cylinder heads are in stock nearby and could be acquired in a few days.

*** 01/22/2021 08:43:33 ***
Web - Note created on 01/22/2021 08:43:32 and created by BRAD REGAN
UPDATE: We were able to fit a chrome socket into the space between the cam and head to check the torque on some of the head bolts, and were able to break them free at just 45 ft/lbs of torque.

*** Web - Advice created on 01/22/2021 09:32:14 and created by Frank Lusic ***
1: Brad called in I asked him to try to retorque the head bolts to see if the threads in the block hold

*** 01/22/2021 10:33:06 ***
Web - Note created on 01/22/2021 10:33:06 and created by BRAD REGAN
I have attempted to re-torque the head bolts as you requested and on the final torque sequence I cannot get the bolts to torque down to spec they just spin.

Web - Note created on 01/25/2021 15:55:54 and created by Shane Chase
Update #2. case started due to factory warranty still intact and unsure if I have approval to tear cylinder heads off to test and check the cylinder heads without a tech case approval.

*** 01/26/2021 06:42:49 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin All Others

*** Web - Advice created on 01/26/2021 06:44:56 and created by Eric Patterson ***
1: You are a DSA A Dealer. Please proceed with checking the head bolts and cylinder heads. Thank you Shane

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 01/26/2021 10:31:19 ***
Web - Note created on 01/26/2021 10:31:19 and created by Shane Chase

Pulled bank 2 valve cover and was able to access most of the head bolts. 5 of which are finger tight and just spin. no metal found in the exhaust ocv filters on this side.

*** Web - Advice created on 01/26/2021 14:21:45 and created by Eric Patterson ***
1: Perfect, please add a picture of the stripped threads, then I will approve the PWA case for the engine replacement

*** Web - Advice created on 01/26/2021 16:41:14 and created by Eric Patterson ***
1: Perfect, thank you

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

1: Do you have any misfires that may lead you at least to the bank that has the issue? I would use a bore scope and see if there is a lot of coolant in any of the cylinders. Check for external head gasket leaks around that cylinder. And then yes, we'll need to do a little further tear down to see if this is more than just a head gasket.

*** 01/25/2021 14:49:44 ***

1: Double check to make sure that you entered the customer's name correctly on the warranty validation page. And what I would do next is see if those rear cylinders have a lot of coolant in any of them. If not, check for proper maintenance by removing the rear valve cover and check for sludge (get a photo) and try to check the head bolts near the leak. See if the bolts are loose or stripped. Some of these can be gotten to with the camshaft still installed if you have a socket that will fit.

1: Hello, Jay. Did pressure drop at all when you performed the pressure test? If you can, please try cleaning off the coolant residue and perform the pressure test again.

Please perform a block test and attach a picture of the result to the case.

2: Please also perform a leak down test on the engine per Technician basics TB009 & while performing the test listen and note any air pressure escaping from the Intake(throttle body), Exhaust system, Radiator w/cap removed or Crankcase/oil cap and list the leak down % results of each cylinder and where air is escaping.

3: If you find that while perform the leak down test you can see bubbles in the radiator, please attach a continuous video showing the VIN plate and bubbles.

*** 01/27/2021 12:02:30 ***

*** Web - Advice created on 01/19/2021 14:51:06 and created by Frank Lusic ***
1: Hello Daniel
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

1: Lets recheck the head bolts as seen below for Bank 1
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

*** 02/08/2021 07:03:09 ***

Customer noticed coolant pooling under the vehicle.

*** 02/09/2021 06:01:13 ***
Web - Diagnostics created on 02/09/2021 06:01:13 and created by Jonathan Burns
Confirmed coolant leaking from back of the engine and down both sides of the transmission and block. Found coolant temp control assembly leaking from the center where the halves of the case connect. cleaned off area and replaced coolant temp control assembly. Didn't notice any further leaks after bleeding cooling system but by the time the customer came to pick up the vehicle, coolant had starting to pool underneath again. Pressurized the system and inspected for further leaks and saw coolant dribbling down the block from the bank 2 cylinder head gasket. I can only confirm bank 2 is leaking at this time as I can't fully see bank 1. I attached a photo of the area of the leak.

1: Hello Jonathan
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

1: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** Web - Advice created on 02/27/2021 13:01:46 and created by Brian Lall ***
1: Did you find any external leaks or a root cause of the overheating? Please inspect the vehicle and note if there is any damage from outside influence to the vehicle especially at the cooling system components and note if any components appear to have been replaced recently. Please also remove both valve covers and check if there are any loose head bolts. If you find loose bolts take pictures or a video showing the bolt will not tighten or showing it removed with any damaged threads from the block on it and attach them to the case. Thanks.

*** 03/10/2021 09:49:46 ***
Web - Note created on 03/10/2021 09:49:46 and created by Zachary Epperly
I can't see any external damage or any obvious signs or overheating from external factors. Vehicle does smoke substantially and smells like coolant. Using borescope, verified damaged head bolt threads. Please see pictures. One good bolt hole for reference as well as a damaged bolt hole.

Engine is overheating.

*** 03/01/2021 06:20:30 ***
Web - Diagnostics created on 03/01/2021 06:13:10 and created by Watson Jean baptiste
Engine does not show any sign of overheating but the coolant goes to the reservoir tank when the engine reach normal temperature and when accelerating . Compression test is ok. C1-150psi, C2-145psi, C3-148psi, C4- 148psi, C5- 145psi, C6- 150psi. I pressurized the cooling system but I did not noticed any coolant in the combustion chambers. Head gaskets were recently replace. No DTC.

*** Web - Advice created on 03/02/2021 10:56:22 and created by Andrew Velasco ***
1: Thank you for all of the information, Watson. Please perform a leak down test on the engine per Technician basics TB009 & while performing the test listen and note any air pressure escaping from the Intake(throttle body), Exhaust system, Radiator w/cap removed or Crankcase/oil cap and list the leak down % results of each cylinder and where air is escaping.

2: If you can see bubbles in the radiator while performing the leak down test, please attach a continuous video showing the VIN plate and bubbles.

3: Please also remove the valve covers and check if any of the head bolts are stripped by tightening them with a ratchet. If

they turn continuously, please attach a continuous video displaying the VIN plate and head bolt turning continuously with the ratchet.

Please also remove the head bolts and show the stripped threads.

*** Web - Advice created on 03/02/2021 10:56:47 and created by Andrew Velasco ***
1: Please attach a picture of the bolts. They do not need to be shown in the video.

Engine is leaking substantial oil and coolant from between block and head.

Technician has seen this before. The headbolts were overtorqued at the factory and have sheered the threads from the short block. A new SB Assy will be required to correct this. Providing 2 photos and a short video of coolant actively dripping from rear of block.

1: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 03/02/2021 08:58:35 ***

*** Web - Advice created on 03/03/2021 09:55:05 and created by Eric Patterson ***
1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

*** Web - Advice created on 09/04/2019 09:43:25 and created by Chris Schang ***
1: Bryce,
We will need to measure the cylinder heads for warpage and see if they are within specs. You can get DPSM approval to tear down the engine to perform this test. When you are removing the head, take note if any of the head bolts pull the block threads out.

hey Chris.
I finally had the time to take the pictures. the valve train looks clean it looks like the heads are in good shape. we maybe able to reuse I took the pictures of the valve train, front casing and the bolts. I added the pictures on this case.

Web - Diagnostics created on 03/15/2021 06:46:45 and created by tai huynh
HELLO SIR.
COOLANT IS DRIPPING TO THE FLOOR, COOLANT LEVEL IS LOW, I DID NOT DETECT COMBUSTION LEAK.
I BELIEVE CYLINDER BLOCK HEAD BOLTS THREAD STRIPPED AND AND LEAKING COOLANT THROUGH CYLINDER HEAD GASKET AT BANK 1
OIL LEVEL IS FULL, NO DTC STORE.
I ATTACHED SCREEN SHOT OF DTC WITH VDN
I ATTACHED SHORT VIDEO OF COOLANT LEAKING AT RIGHT BANK (B1) CYLINDER HEAD GASKET AREA.
IF ENGINE RUNNING LONG ENOUGH I CAN SEE COOLANT BUBBLE OUT.
PLEASE ADVISE. THANKS

ok will so far I can see the head gasket leaking rear one and also the fan working no issue

*** Web - Advice created on 02/11/2021 11:05:16 and created by Greg Phillips ***
1: Samuel, you'll need to dig deeper on this and determine if this is just a head gasket, or if there is something bigger going on. Is there a lot of coolant in any of the cylinders on that back head? Any scoring or cracking of the cylinder walls? If you can't see anything definitive, then I would start removing that head for further inspection, but I would check the torque on the head bolts before removing them. Are any of them loose? If so, I would see if there is stripped head threads on the bolt threads.

1: based on the information you have provided, I recommend that you replace the engine following normal service procedures as outlined in the Shop Manual. Please refer to Pit stop PS539 for Engine Component Re-use Guidelines .

2: For GDI engines, some high pressure fuel system components require replacement if removed, including: high pressure fuel pump bolts, fuel pipe, delivery pipe mounting bolts, injector retaining clip, injector O-ring, injector combustion seal ring, injector backup ring & injector washer seal. Refer to ENG083.

3: Fill crankcase with the proper amount of oil. Recommended Product: QUARTZ 9000 FUTURE FGC 5W-30 Full Synthetic SN PLUS, QUARTZ 9000 FUTURE XT 5W30 Full Synthetic SN PLUS, Mobil Super Synthetic 5W30 or above.

SENT 2 VIDEOS ONE FOR THE BURNING OF OIL ON THE PLUGS AND A SECOND FOR THE SMOKE OUT THE TAIL PIPE.
THE SMOKE IS A COMBINATION FOR OIL BURNING AND COOLANT.
THERE IS A STRONG ODOR OF COOLANT BURNING FROM THE TAIL PIPE AS WELL AS OIL. THE ENGINE WAS 2 QTS.
LOW ON OIL. VALVE TRAIN IS VERY NOISE AT START UP BUT QUITS DOWN AFTER A FEW SECONDS.

1: Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 03/26/2021 10:30:48 ***
Web - Problem Description created on 03/26/2021 10:30:48 and created by Roberto Siqueiros
Engine has a no start condition.

*** 03/26/2021 10:30:49 ***
Web - Diagnostics created on 03/26/2021 10:30:48 and created by Roberto Siqueiros
Removed spark plugs from cylinders 2, 4, and 6. Notice that all the spark plugs were covered in coolant. Performed a compression test and found low compression on all cylinders, the highest was 25 psi on cylinder 1. A video of the coolant shooting out of the cylinders and a picture of the spark plugs will be uploaded.

1: Thank you for the video. We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Hi Jeffrey,
Thank you for the video showing the coolant leak. Please also send a picture showing the stripped head bolt threads for review.

*** 03/30/2021 05:30:59 ***
Web - Note created on 03/30/2021 05:30:59 and created by Alan Mcmillen
Brian,
Jeff is recommending the short block due to the fact that commonly these threads pull out of block (not that they already have) your not asking him to tear this engine down to take photos, right?

*** Web - Advice created on 03/30/2021 08:43:03 and created by Brian Hernandez ***
1: That is correct, Alan. I'd like to provide PWA authorization for an engine and I believe the head bolt threads could be

stripped from the engine overheating. In order to provide authorization for an engine we would need to see pictures of head bolt threads.

1: Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please refer to service info and TSB ENG083.
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

1: "Thank you for the video attachment. The video you have sent in is acceptable showing the cylinder block treads have come out and engine needs replacement.

I have generated and approved a PWA case for you. Based on the information you have provided; you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083. Thank you."

1: Hello Kenneth
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 04/15/2021 09:02:37 ***

Engine is over heating,

*** 04/13/2021 16:58:20 ***
Web - Diagnostics created on 04/13/2021 16:21:24 and created by Patrick Gabello
scanned dtc's

Checked coolant level, it is very low. No coolant in radiator.

Performed cooling system pressure check. System held pressure.

Checked for external leaks, found leaks from the back of the left bank cylinder head gasket.

Removed left bank valve cover and checked the back cylinder head bolt for torque, found zero torque.

Cylinder head bolt threads pulled out of the engine.

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin Default

*** Web - Advice created on 04/14/2021 08:02:16 and created by John Rehm ***
1: Patrick, was the only leak found to be from the head gasket? Is it leaking a lot under pressure?
At the end of the video attached it looks like the bolt started to get tight. Does the bolt get to 30 ft lbs? DO not torque it beyond this if the 30 ft lbs can be achieved, please note here.
Is the engine oil contaminated with coolant?
Coolant has oil?

*** Web - Advice created on 04/14/2021 09:51:02 and created by John Rehm ***
1: Patrick,
We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 04/16/2021 07:17:29 ***

1: Thank you Patrick. I will get a PWA approved for this concern.
If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

1: Hello, Robert. Thank you for all of the information. Please perform a leak down test on the engine per Technician basics TB009 & while performing the test listen and note any air pressure escaping from the Intake(throttle body), Exhaust system, Radiator w/cap removed or Crankcase/oil cap and list the leak down % results of each cylinder and where air is escaping.

2: Please also attach a video displaying the VIN plate and the bubbles coming from the radiator while performing the leak down test.

3: Please also remove the valve cover from the affected bank and use a ratchet to check if any of the head bolts are stripped.

If you find that they are stripped, please attach a continuous video displaying the VIN plate and stripped bolts by using a ratchet to continuously tighten them.

Please also remove the head bolt(s) and show the stripped threads in a picture.

1: "Thank you for the video attachment. The video you have sent in is acceptable showing the cylinder block treads have come out and engine needs replacement.

I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083. Thank you."

1: Scott,
Do the 2 head bolts you accessed show any signs of block material on the threads?

*** 04/20/2021 10:18:50 ***
Web - Note created on 04/20/2021 10:18:50 and created by SCOTT SPOHN
yes there is small shards of aluminum on the threads

*** Web - Advice created on 04/20/2021 12:04:33 and created by Chris Schang ***
1: Scott,
Can you submit photos of the debris on the bolts. From there, I can approve a PWA for engine replacement. A long block would be advised first and foremost to avoid any tear down to inspect for warped heads. If one is not available, you would

have to tear the heads down to inspect for warping and determine the extent of the repair.

CUSTOMER STATES THE VEHICLE SHUT OFF ON THE HIGHWAY AND ALL THE LIGHTS CAME ON. TOWED IN.

TRIED TO START VEHICLE, JUST CRANKS AND WILL NOT START.. ALSO SOUNDS LIKE THERE IS NO COMPRESSION. PUSH VEHICLE IN AND INSPECTED, CHECKED COOLANT LEVEL AND FOUND RADIATOR IS EMPTY AND IS MELTED ON THE NECK OF THE RADIATOR AREA FOR THE CAP. ADDED WATER TO FILL SYSTEM AND CHECK FOR LEAKS. AFTER ALMOST 4 GALLONS OF WATER WAS ADDED DID NOT SEE A LEAK. REMOVED 3 FRONT SPARK PLUGS AND FOUND WATER IN CYLINDERS 4 & 6 THAT WENT PAST THE SPARK PLUG HOLE THREADS INTO THE PLUG TUBES. LOOKING TO REPLACE THE LONG BLOCK DUE TO OVERHEATING. SCANNED AS WELL, NO ENGINE CODES WERE STORED.

1: Thank you for the information.,

Please make sure there are no holes in the radiator that has caused the leak and the overheating.
2: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.
3: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 04/21/2021 16:52:06 ***
Web - Note created on 04/21/2021 16:52:05 and created by Miki Djilas
Alright thanks for getting back to me. I am off work tomorrow (Thursday) so I am responding from home. Being that the cylinders filled with water so quickly and fully, I do not believe a short block will be enough, which is why I brought up a long block, this thing over heated enough that it melted the plastic on the radiator neck (needs a new one anyways) I can take some pictures Friday when I can get the car back in the shop, maybe even a video of it. After I did fill the cooling system with water I used a blow gun in the neck of the radiator and it was making the water bubble in the combustion chamber. There was even water leaking out of the tail pipe after putting so much in it. I'm really feeling the heads are warped from the overheating. Being I am new at kia, I want to make sure there is authorized time for engine tear down, i will not be accepting of loosing time for diagnosis, especially major engine disassembly. thank you.

The customer came in the first time, stating their vehicle was overheating. I found the cooling fan to be bad, so it was replaced. The customer left, but returned a couple days later saying it is still overheating. It has a blown head gasket, likely from the first time overheating before the fan was fixed. Coolant out the tailpipe, exhaust in the cooling system. I am wondering what the proper steps are to repair. is it something that is covered under warranty, or will it be customer pay?

1: This would be warranty.

Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.
2: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 05/06/2021 08:41:02 ***
Web - Note created on 05/06/2021 08:41:02 and created by Justin Swint
I did not see any coolant leaks, i tore down the front bank, and attempted to torque the middle bolt, and it just free spins. I will

update again with a picture of the bolt.

Customer stated that vehicle will over heat randomly.

*** 04/29/2021 08:45:25 ***
Web - Diagnostics created on 04/29/2021 08:45:17 and created by Harrison Stivrins
Found vehicle to be slightly low on coolant. Customer states that they have not added any coolant. Found signs of dried coolant residue on upper hose where goes over radiator. also found signs of dried coolant on heater core hoses. Do not see any visible signs of wet coolant besides between the head and the block.. Pressurized system and found the pressure to drop fairly quickly. Performed combustion test and the fluid turned blue indicating that there is a blown head gasket.

Web - Problem Description created on 05/26/2021 08:42:29 and created by Rodney Ledet
Coolant leak at rear of bank 1 cylinder head. See attatched photo.
Also customer complaining of oil consumption. 3qts low since last oil change at 70,876 miles. (3 its in 4,330 miles)
vehicle still has powertrain warranty.
The coolant leak is not large but it probably will only get,worse.

*** 05/26/2021 09:36:38 ***
Web - Diagnostics created on 05/26/2021 08:59:38 and created by Rodney Ledet
Performed inspection for external oil leaks and found coolant leaking from head gasket area of bank 1 cylinder head.
Checked cooling fan operation and found cooling fan operate as designed, checked thermostat operation and found thermostat is opening and coolant is flowing through cooling system..
No restrictions seen in air flow through radiator.
Checked for restricted PCV valve. Valve is not restricted.

*** Web - Advice created on 05/26/2021 11:51:49 and created by Eric Patterson ***
1: Thank you for the picture.:

Especially near the leak area, see if the head bolts are loose

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

Misfire cyl 1. Found oil and coolant leaking from bank one head gasket around cyl 1. While running I can see bubble coming from same area. Block test failed. Removed valve cover and checked torque of head bolts. Two head bolts rotate freely and will not even tighten to 20 lb/ft. Head bolt threads are pulled out of block. Needs short block.

1: Thank you for the video I see the threads are stripped.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please replace the engine under normal warranty procedures.

*** Web - Advice created on 06/18/2021 14:39:29 and created by Frank Lusic ***
1: Hello Dylan

Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 06/23/2021 14:44:09 ***

C/s that their vehicle would overheat during driving cycles. Customer had the thermostat replaced at another facility.

*** 06/17/2021 06:43:48 ***
Web - Diagnostics created on 06/17/2021 06:23:32 and created by SAMUEL SPEARS
Inspected and found that the coolant level is low, noted that the coolant color is yellow. Performed a coolant pressure test and confirmed that the system is not holding pressure, goes to zero after 5 minutes from 20psi. Performed a block tester for combustion gases in the cooling system, tester was inconclusive. Removed intake and checked cylinders with a bore scope for any abnormality, found cylinder 2 has fluids on the pistion, and cylinder 5 has wetness. Performed a leak down test, found that pressure in the cooling system rises with both cylinder 2 and 5.

1: Hello Sean
I have seen coolant leaking from exhaust manifold studs,
please replace the cylinder head

*** 06/17/2021 08:47:56 ***
Web - Note created on 06/17/2021 08:47:56 and created by Sean Goodall
if coolant is leaking inside cyl head is that from spun head bolts?

*** Web - Advice created on 06/17/2021 09:33:23 and created by Frank Lusic ***

1: not usually , coolant leaking from the exhaust studs is usually due to coolant leaking into the hole for the exhaust stud not a head bolt issue , unless the coolant is leaking from the head gasket and not the stud

*** 06/17/2021 10:43:07 ***
Web - Note created on 06/17/2021 10:43:07 and created by Sean Goodall
ok cool

*** Web - Advice created on 06/17/2021 11:34:25 and created by Frank Lusic ***
1: There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

Vehicle is out of warrenty. Customer concer was that engine began knocking and engine shut off.

*** 07/02/2021 07:25:11 ***
Web - Diagnostics created on 07/02/2021 07:25:11 and created by moises flores
Once vehicle arrived, performed inspecion and found that the enigine had seized. upon further inspection, engine short block got approved by service contract. Now that all parts have arrived, i began putting together cylinder heads on the block. The LH side had no problems, HOWEVER, when i got to the RH side, while performing second set of torque to the headbolts, 3 of the center bolts became loose. I removed the 3 head bolts and i found that the threads on the block came appart. All torque specs i was following according to KGIS. The Block that was sent is defective and looks as if it was used and in no good condition.

*** Web - Advice created on 07/03/2021 08:48:46 and created by John Rehm ***

1: Steve, if there are no other leaks from cooling system and no accident damage which could have caused a leak due to damage, then
We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold.
Please attach a carfax report to the case for maintenance and any accident history. Thank you

*** 07/05/2021 08:44:28 ***
Web - Note created on 07/05/2021 08:44:28 and created by Steve Rihacek
I will check what you advised, I have also attached a photo of the carfax.

Web - Note created on 07/06/2021 12:31:38 and created by Steve Rihacek
yessir, pulled the engine down to the head bolts and the head bolts on bank 2 cylinder head right by the coolant staining spun nearly instantly. i dont think i even had 10ftlbs on the 3 on that side before they broke loose. pulled the ocv valves as you asked and found no metal in the ocv's, but it looks like this is either gonna need a long block or a short block build my man. seems to be a common occurance with these v6's lately

*** Web - Advice created on 07/06/2021 14:07:38 and created by John Rehm ***
1: Thank you for confirming Steve.
Please add picture of the stripped bolts if they will not hold. 1 image of all the bolts is ok.
Please request maintenance records from the customer and if no records, or few can be provided, please request a Carfax report and attach to the case for review. Records with Kia show NO maintenance at the dealerships. After you gather all the needed information and perform testing, update the case. Thank you.

Web - Problem Description created on 06/25/2021 09:20:25 and created by Richard Lindner-Jackson
I have a 2018 Sorento that the customer is stating that is loosing coolant and overheating. I looked car over and replaced the radiator May 21,2021 because it had a leak in it. Customer came back today complaining of the same problem and i found no leaks but I did a pressure test and system loses pressure at a decent rate and I performed a leak test and the liquid turned from blue to yellow which indicates that the head gaskets are leaking. I am asking for an engine because I know that the head bolts will strip out as I have had this happen multiple times when doing a short block on a 6 cylinder engine.

1: Richard, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications. If you find any damage please provide a continuous video of the stripped threads and include a clear view of the VIN. Please report your findings

Customer states vehicle shut off while driving.

*** 07/06/2021 12:52:21 ***
Web - Diagnostics created on 07/06/2021 12:52:21 and created by Daniel Nielsen
When cranking vehicle the cooling system instantly overpressurizes and blows out the bottle. When vehicle starts you can hear air escaping rapidly. While underneath you can see coolant and oil spraying out from between both cylinder heads. Watching the rear of the engine while running you can see the exposed portion of the headgasket flap and when you put your hand near it you can feel the super hot air being forced out from between the two. At 80,078 miles vehicle was at NY076 and had timing components replaced. Unsure of other work performed.

1: Thank you for the pictures attached.
2: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** Web - Advice created on 07/16/2021 16:25:29 and created by John Nguyen ***
1: Michele, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications. If you find any damage please provide a continuous video of the stripped threads and include a clear view of the VIN. Please report your findings

customer states vehicle has transmission and oil leak

*** 07/26/2021 10:23:58 ***
Web - Diagnostics created on 07/26/2021 10:23:57 and created by Giovanni Guevara
verified there is a leak but its just engine oil from the left hand cylinder head and also coolant is bubbling in the reservoir

*** 07/26/2021 10:46:07 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin defaults

*** Web - Advice created on 07/26/2021 10:48:15 and created by Sam Camarillo ***
1: Ok if the leak is from the head gasket and you also have a coolant leak it sounds like do the following:
Please gain access to the head bolts closest to the area of the head gasket leak. Apply 45-50ft lbs of torque to them, see if they loosen or spin. If any do the threads in the cylinder block have stripped, will need short block replacement. Let me know what you find.

*** Case has been auto closed by the system on 08/11/2021 01:14:30 (PST)
*** 09/23/2021 14:41:57 ***
Case Number: XXXXXXXX Reopen Requested by Giovanni Guevara.
Reason: [Cylinder head bolts were tight and did not take out threads
Sounds like I'll just replace the gasket and hopefully the threads do not pull when I re torque it]

*** 09/23/2021 17:27:06 ***
Reopened with Sub Status of Working

*** Web - Advice created on 09/23/2021 17:27:50 and created by Sam Camarillo ***
1: Ok be sure to check head and block for flatness as per Kia specs thanks

Engine overheats

*** 08/03/2021 05:37:21 ***
Web - Diagnostics created on 08/03/2021 05:37:21 and created by Bob Dempsey
Compression is entering the cooling system. There are bubbles in the coolant bottle.
We removed the spark plugs and put air pressure into the cylinder # 5. The head bolt around that cylinder just turns. We removed the bolt and the threads are pulled. I have attached a picture of the bolt. there are 2 pictures of the same bolt.

*** Web - Advice created on 08/03/2021 08:29:41 and created by Greg Phillips ***
1: Does the fan work? Any damage to the fan, the radiator or condenser, any blockage or modification of air flow through the radiator? Has proper maintenance been verified, there are almost no Dealer oil services on record.

*** 08/03/2021 09:08:49 ***
Web - Note created on 08/03/2021 09:08:49 and created by Bob Dempsey
The fan does operate normally. We have never seen this vehicle so I have no history.
The radiator and condenser have no restriction, we can see light through the fins. We have seen this issue in the past, only on

the V6 engine and only in the rear. Do you want records from the customer?

*** Web - Advice created on 08/03/2021 10:20:17 and created by Greg Phillips ***
1: You have the valve cover off, get a photo of the valve train. If there is sludge, yes, we'll need records.

1: We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold.

1: I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please refer to service info and TSB ENG083.

2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

*** Web - Advice created on 08/11/2021 09:00:06 and created by Juan Vazquez ***
1: Thank you for that information. Please use a mirror to verify oil is not coming from under the intake manifold. Clean surface and run vehicle to determine exact location of leak.

It may be necessary to add oil dye and if leak is under the intake, the manifold may have to be removed to determine the origin of this leak.
2: NOTE: If it is determined that leak is coming from the head gasket, we will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

If unable to torque the head bolts because they are striped. Please remove stripped bolts and attach photos showing block aluminum treads on the bolt(s), then I will approve a PWA case for the short block replacement, thank you."

1: Dustin, have you pressure tested this system or run a block test on it? Your video doesn't really show anything. The movement that we can see in the video could be an air bubble. And there is virtually no smoke form the tailpipe visible in the video. Has this vehicle overheated? Are there external coolant or oil leaks around the head gaskets? Is there sludge in this engine? There are no Dealer oil service records on this that I can find. I need more than what's in the video, the video doesn't really show us much.

uploaded a pic of block test results as for any leaks there are none and no signs of sludge.

*** Web - Advice created on 08/12/2021 11:06:45 and created by Greg Phillips ***
1: I would recommend next start disassembling the heads to see if this is more than just a head gasket. Look for coolant in cylinders or misfires, to determine which bank it is. And if you find head bolts that are stripped along the way, stop and let me know. Otherwise, inspect the head gasket, block and head.

*** 08/12/2021 14:02:54 ***
Web - Note created on 08/12/2021 14:02:54 and created by DUSTIN MAY
upon tear down i did find that the back corner head bolt on the rear head is stripped.

*** Web - Advice created on 08/12/2021 14:38:18 and created by Greg Phillips ***
1: This will need an engine. You guys are DSA Level A, so you don't need a PWA for it.

1: Thank you for the attachments in the case.
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the

heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

*** Web - Advice created on 08/24/2021 14:17:03 and created by Frank Lusic ***
1: Hello Marcus
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** Web - Advice created on 08/20/2021 10:55:23 and created by Frank Lusic ***
1: Hello Kyle
yes it is covered

Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings
2: To remove the oil from the cooling system please use Shout laundry detergent with just water in the cooling system and the thermostat out then let the engine idle for about 30 minutes the flush with clean water then repeat if necessary until all of the oil has been removed , use about 1 cup per flushing

Customer states vehicle is overheating while driving.

*** 09/07/2021 09:28:29 ***
Web - Diagnostics created on 09/07/2021 08:53:27 and created by Monserrat Chavez
Confirmed customer concern, checked for codes and there's no present codes at this time, coolant was low added coolant and performed cooling filling procedure with KDS, took vehicle for a drive and when got back to the shop noticed that exhaust gas was coming out of the coolant reservoir, performed a combustion leak test and fluid turned yellow.

*** Web - Advice created on 09/07/2021 11:21:43 and created by Eddie Milton ***
1: Good afternoon, Monserrat. Can you please inspect both heads for any external coolant leaks?

*** 09/07/2021 15:21:10 ***
Web - Note created on 09/07/2021 15:21:09 and created by Monserrat Chavez
No evidence of any external leaks to cylinder heads.

*** Web - Advice created on 09/07/2021 15:25:46 and created by Eddie Milton ***
1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** 09/17/2021 08:42:18 ***
Web - Note created on 09/17/2021 08:42:18 and created by Monserrat Chavez
Treads in the block and head bolts were fine, checked flatness on cylinder heads with a straight edge and filler gauge and I was able to pass through with filler gauge .004 in. in between straight edge and cylinder heads, both of the cylinder heads are out of spec.

*** Web - Advice created on 09/20/2021 08:35:25 and created by Eddie Milton ***
1: Monserrat, did you check the trueness of the block as well?

*** 09/23/2021 08:05:56 ***
Web - Note created on 09/23/2021 08:05:56 and created by Monserrat Chavez
Cylinder block is good checked it with straight edge and is in specification.

*** Web - Advice created on 09/23/2021 08:17:37 and created by Eddie Milton ***
1: Thank you for the update.

2: Monserrat, I recommend to replace the heads. Please update the case once they have been replaced.

1: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Ok Thank you

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please replace the engine under normal warranty procedures.

I have this sorento here that the customer states the vehicle is overheating. I have confirmed the customer concern. I have found traces of coolant leaking in the valley of the engine. I have removed both the upper and lower intake manifolds and am uploading photos to the case for your review. I have also performed a coolant pressure test and did not see any leakage but I do smell coolant.

1: Jake, thanks for letting me know what you found. Please take pictures of the blue reman tag on the engine, of the metal contamination, and of the worn/damaged bearings and attach them to the case. Please also note if the oil pump or any other components were replaced when the engine was replaced. Thanks.

*** 09/30/2021 12:35:11 ***

*** Web - Advice created on 09/20/2021 13:05:44 and created by Greg Phillips ***
1: Is there any sign of coolant in the oil, or that this had overheated? Any misfires on that bank? The spark plug photo is blurry, but it kind of looks like they are ashed like it's been burning oil. Is that the bank with the leaking head gasket? You may need to remove that valve cover and check for head bolts that are loose or have threads on them pulled from the block.

*** Service Alert Escalated to CA as: 14264073 on 09/21/2021 01:06:25 (PST)

Case Number: XXXXXXXX Reopen Requested by Mathew Stinnett.
Reason: [there is no signs of oil in the coolant and no signs of coolant in the oil. the spank plugs were not from the leaking bank. i took the back valve cover off and there is no way to get to head bolts without removing cam]

*** 12/22/2021 09:21:51 ***
Reopened with Sub Status of Working

*** Web - Advice created on 12/22/2021 09:24:27 and created by Greg Phillips ***
1: If you have the right size socekt and extension, it is possible to get to some of the head bolts without removing the cams. When we do encounter one with pulled threads, it's usually one of the bolts we can get to. So I would check those first. If none are pulled, get DPSM authorization to pull the cams and head to further inspect the gasket, head and block. If you find pulled bolt threads along the way, stop, add a photo and let me know.

*** 12/22/2021 10:51:06 ***
Web - Note created on 12/22/2021 10:51:06 and created by Mathew Stinnett
So since you said it was possible, I asked around for suggestions and someone came up with an wobble head extension. Now able to check 6 of the head bolts on rear bank and none of them had loose treads.

*** Web - Advice created on 12/22/2021 14:08:41 and created by Greg Phillips ***
1: Thanks Mathew, please get DPSM authorization to proceed further and check the rest.

*** 12/23/2021 10:13:21 ***
Web - Note created on 12/23/2021 10:13:21 and created by Mathew Stinnett
so with the bolts i checked not being loose and and me not really remembering the details on cars and it being left apart. i put intake back on and ran car to hear again and check for bubbling out the coolant funnel which there was no bubbling. was a cup or so low. rattling noise sounding like it was coming from front bank timing cover or valve cover. decided to take off front valve cover and found that the front chain is loose and is the cause of the rattling. i am now convinced that none of the threads are stripped and the head gasket is fine comparing the symptoms to a V6 with actually stripped treads. sent attachment of the chain

*** Web - Advice created on 12/23/2021 10:19:09 and created by Greg Phillips ***
1: We were following the path from the leaking head gasket, oily substance in the coolant, and the coolant being low. And the coolant bubbling with the engine running. It looks like the attachment has not come through yet.

*** 12/23/2021 10:21:48 ***

1: Sorry for the delay. I was out last week. I can't see what you are trying to show me in the chain photos. One way to check for a stretched chain would be to see if you can twist or wiggle the individual links. There should be no play in any direction on the individual links, except in the direction that they are designed to pivot, if the chain is good. I would also try rotating the engine slightly just to make sure you haven't caught it on a spot that allows brief slack without the engine running. And check for a failed tensioner.

*** 01/11/2022 10:50:45 ***
Web - Note created on 01/11/2022 10:50:45 and created by Mathew Stinnett
sorry the pics are mislabeled. those are the best pics i could get with borescope of the timing chain tensioner. i inspected the chain and compared the links to the chain on the back bank and there is no difference. in the way both chains pivot. when i rotate the tension does get tight but i felt it was way more slack than any engine I've worked on with the ratcheting tensioner. when comparing the tension on the back bank, the front bank chain get way looser than the rear. i can physically se the chain go limp in the front, the back chain may get a little slack but it stays tight against the top chain guide

1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
2: Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.
3: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please replace the engine under normal warranty procedures.

1: Hello Roberto
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

ENGINE OVERHEATING/OIL IN COOLANT

*** 10/05/2021 13:39:21 ***
Web - Diagnostics created on 10/05/2021 13:39:15 and created by Branden Mckibben
DURING VISUAL INSPECTION, FOUND NO OIL ON DIPSTICK, NO COOLANT IN RADIATOR AND COOLANT RESERVOIR FULL OF OIL. RADIATOR IS SLUDGED UP AS WELL. I FOUND THE UPPER RADIATOR HOSE BLOWN OUT. I REPLACED THE UPPER HOSE, CLEANED THE RESERVOIR AND ADDED COOLANT SO THAT I CAN TRY TO DO A BLOCK TEST. WHEN RUNNING THE ENGINE AND BURPING THE COOLING SYSTEM THE COOLANT BLOWS OUT OF THE RADIATOR LIKE A VOLCANO SO I AM UNABLE TO DO A BLOCK TEST. I KNOW IT NEEDS HEAD GASKETS BUT I WANTED TO OPEN THIS CASE TO SEE HOW YOU GUYS WOULD WANT ME TO PROCEED. IF THE UPPER HOSE CAUSED THE OVERHEATING THEN I WOULD ASSUME THAT THIS WOULD NOT BE COVERED UNDER WARRANTY. ALSO EVERY V6 IVE DONE HEAD GASKETS ON HAS ENDED UP NEEDING A SHORT BLOCK BECUASE THE HEAD BOLTS STRIP THE BLOCK OUT WHEN TRYING TO TORQUE THEM DOWN.

*** Web - Advice created on 10/05/2021 16:49:18 and created by Brian Hernandez ***
1: It's possible the top hose came off due to the excessive heat and pressure in the system. Check with your DPSM as far as it qualifying for warranty. I do agree with the idea of tearing down the engine to check the torque on the head bolts. Go ahead and do so. Please send a picture of the head bolt threads if they are stripped.

*** Web - Advice created on 10/11/2021 16:21:44 and created by John Rehm ***
1: Jayden, the bolts look like they got tight ok in your video.
The bolts you showed do not show any threads from the engine block.
Is there any metal on the OCV's?
Please add a picture of the stripped bolts if they will not hold. If all bolts tighten ok, please note this.
Usually techs show the removed bolts with the threads from the block still on them.

I am aware that we have had headbolt issues on earlier models.
when I filled the cooling system up earlier, in was leaking at the back of bank 2 head.

*** Web - Advice created on 10/19/2021 16:28:16 and created by John Rehm ***
1: Dennis,
We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing.
If there is any scoring in the #6 cylinder, and you are able to show this then you can attach the images to the case. This would show the need for an engine block with this repair.

*** 10/22/2021 07:52:00 ***
Web - Note created on 10/22/2021 07:52:00 and created by Dennis Hogan
removed timing chain and bank #2 camshafts,
checked headbolt torque @ 75 ft. lbs. (2 bolts will not tighten)
checked for metal in oil control valve (none found)
when drained oil, found coolant in oil pan, not sure how long was driven like this.

*** Web - Advice created on 10/22/2021 10:22:57 and created by John Rehm ***

OK YES ON A PULL IT DROPS TO LESS THAN 30PSI

*** Web - Advice created on 10/26/2021 14:00:11 and created by Brian Lall ***
1: Thanks for letting me know. Now remove the fuel pressure gauge and reconnect the low fuel line to the GDI pump inlet securely. Then connect the fuel pressure gauge inline between the outlet of the low pressure fuel pump and the low pressure fuel line at the back of the vehicle. Then do the same test again with the help of an assistant to monitor the fuel pressure and

note if it still drops or if the pressure is maintained. Thanks.

*** Web - Advice created on 12/10/2021 06:47:27 and created by Brian Lall ***
1: Did the vehicle leave and return or has it been at the dealer the entire time? Please check for any DTCs in any system and attach a screen shot of them to the case. Then take an all data engine flight recording after clearing the DTC set up for DTC or manual trigger and stop the recording (if in manual trigger mode) after the concern is duplicated. This will record the previous data and capture the concern. Then attach the flight recording to the case. Thanks.

1: Please double check and install the low-pressure fuel gauge in line with the GDI pump inlet and if it can be done safely rout it under the hood and tape it to the windshield so the pressure can be monitored while driving. With the help of an assistant, note the high side fuel pressure actual and set point shown in the current data, and what the low side pressure is at idle, while driving under a heavy load, when you shut the engine off (turn the ignition back on and leave it on to check the high pressure in the data) and then after it has been shut off for 10 mins.

*** 12/10/2021 11:34:55 ***
Web - Note created on 12/10/2021 11:34:54 and created by Homer Lanham
at idle when first starting its low 75psi high480 and desired is 485 after 100 yards of driving low pressure is 70-75 high pressure is 65 and desired is 65 . sets p0087. key off then on set ten minutes all three are 65 psi

*** Web - Advice created on 12/10/2021 12:48:43 and created by Brian Lall ***
1: Please double check the wiring and pin tension at the connector to the regulator on the GDI pump, rail pressure sensor, at CC22-B, and at EC11 pins 58, 59, and 75. Add at least 2 coats of stabilant to the male terminals allowing it to completely air dry between coats and before installing the connectors then retest. If the concern continues my recommendation is to replace the GDI pump. Thanks.

*** Phone - Advice created on 12/13/2021 07:00:09 and created by Tony Thomas ***
1: Bill called in and I reviewed the case and flight recording. Appears the rail pressure sensor is dropping the 5 volt reference or signal wire and putting the high pressure pump in default. Advised to use tee connectors to check the rail pressure sensor to see which signal is being lost and disconnect the FTPS to see if normal operation is restored.

*** Phone - Advice created on 12/15/2021 05:21:07 and created by Brian Lall ***
1: The tech called and advised he can back probe the pressure sensor and he does not loose the 5v reference or ground and the signal voltage shows the same at the sensor as in the PCM data. The GDI pump was replaced and he even swapped a known good low pressure pump into the vehicle and there is no change. The rail pressure sensor has been replaced 3 times, this is the 3rd one. I advised I do not think the RPS is reading incorrectly and we discussed the possibility of a restriction in the opening to the sensor and he blew through the rail onto a white paper and it had good air flow with no debris found. When the high side pressure drops there is 75psi of low fuel pressure to the inlet of the GDI pump. I advised to check the oil for fuel saturation indicating there may be one or more injectors stuck open. If the fuel is not oil saturated, I advised my recommendation is to replace the GDI pump again and to inspect the bracket, tappet, and camshaft lobe the tappet rides on for any scoring, discoloration, or other damage.

*** 12/20/2021 11:28:09 ***
Web - Note created on 12/20/2021 11:28:09 and created by Homer Lanham
oil not fuel saturated , replaced high pressure pump, line and tappet cam looks good . test drove about ten miles , high pressure slowly drops down to were car will go into limp home mode . set p0087 .
would the crank sensor do this ?

*** Web - Advice created on 12/21/2021 07:34:46 and created by Brian Lall ***
1: The CKP cannot cause this concern. If the fuel pressure is dropping it is leaking from a line, the pump, injectors, or it is draining back into the tank unless the pressure sensor is reading incorrectly. I know the rail pressure sensor has been replaced multiple times. Please check the pin tension and connections to the RPS and to the related connections in the circuit. Thanks.

1: I did escalate the case to try and get some FTS assistance. I am not sure if they will be assisting remotely or what the travel availability is currently. Since the concern happens when the low fuel pressure into the GDI pump is stable and it happens very quickly I suspect this could be the result of a connection issue, especially since the RPS, GDI pump, and all injectors have been replaced. Please carefully check the pin tension and for any loose, bent, backed out, terminals that can be pushed out, or are damaged at pins 5, 9, and 10 of CC22-B, at EC11 pins 58, 59, 75, 94, and 95, at pins 15, 28, and 37 of E500-A, at pins 45, and 60 of E70, and at pins 1 and 2 of C509. Check the pin fit tension with the appropriate pin fit tool.
Thoroughly inspect the pin fit tension using the T connector, review TSB electrical 064 to determine the correct size T connector.
Review Tech Times Article Volume 18 Issue 4 Page 4 for the correct pin fit tool.
Note it's critical to take the time to determine the correct size tool for proper pin fit inspection.
Thank you

1: Michael, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications. If you find any damage please provide a continuous video of the stripped threads and include a clear view of the VIN. Please report your findings

*** Service Alert Escalated to CA as: 14455093 on 10/29/2021 01:08:34 (PST)

*** 10/29/2021 06:57:22 ***
Web - Note created on 10/29/2021 06:57:22 and created by Michael Boyer
The heads have already been removed the picture is the head gasket removed. When removing the head 2 of the head bolts were not tight one was finger tight. Location of bolts were in front of the gap in the gasket also. Would have to reassembly heads to test torque but I can verify that one was loosely tight and one was finger tight did not use a breaker to turn just hand on socket. For being warped the block was out of spec the head was in but a good amount of scoring present.

*** Web - Advice created on 11/04/2021 07:43:26 and created by Frank Lusic ***
1: Hello Wesley
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 11/09/2021 06:59:38 ***
Web - Note created on 11/09/2021 06:59:38 and created by Jordan Byrd
found that the rear head bolt closest to the exhaust cvvt is lifted shown in video attached,. Attempted to torqued head bolt down and will not hold torque

*** 11/09/2021 06:59:45 ***

i believe the head gaskets are blown. With the radiator cap removed and revving the engine coolant sprays out of the radiator. should i go ahead and check the torque spec on the head bolts?

*** 07/06/2021 15:48:10 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin Default

*** Web - Advice created on 07/06/2021 15:51:26 and created by Andrew Velasco ***
1: Hello, Aaron. Please attach a funnel to the radiator and attach a video showing the VIN plate and coolant bubbling while increasing engine speed.

2: Yes, please remove the valve cover on the problem bank and attach a continuous video displaying the VIN plate and use a torque wrench to show the torque on the stripped head bolt(s).

Please also remove the head bolt(s) and attach a picture showing the stripped threads.

customer states coolant leaking all over the place. car is pushing out coolant.

*** 11/09/2021 06:34:12 ***
Web - Diagnostics created on 11/09/2021 06:32:06 and created by Ray Becker
check and verified lower splash shield covered in coolant. performed radiator pressure test no signs of external leak hot or cold. could watch pressure tester drop fairly quickly. if leak was external should have been fairly easy to find. try perform chemical block test could not get correct test as was drawing coolant into test tube even after draining coolant. installed rad pressure tester with out applying pressure started engine and let run. watched pressure tester increase to roughly 4 psi. suspect pulled head bolt threads in the engine block. will have the service advisor call the customer to see if this engine has ever been overheated. may need to perform compression test and cylinder leak test next.

*** 11/09/2021 07:20:46 ***
Web - Note created on 11/09/2021 07:20:46 and created by Ray Becker
had the service advisor contact the customer and what he is describing sounds like the car did over heat. on saturday the coolant fan kept running would not shut off. coolant was running out from under car and the over flow was empty. i did check and verify the car has good heat does not seem like a poor flow condition.

Web - Problem Description created on 11/19/2021 12:19:00 and created by omar cabello
C/S THE VEHICLE WAS OVERHEATING is the customers original concern. found the overheating has caused the head gaskets to fail. after pulling off the cylinder heads, found one of the piston has a mark on it.

*** 11/19/2021 12:33:35 ***
Web - Diagnostics created on 11/19/2021 12:19:00 and created by omar cabello
found the what looks like a crack in one of the piston after removing the cylinder heads. the cylinder head does NOT have any damage to it or the cylinder wall. looks like it may be a defect in the material that was used in making the piston. should the short block be replaced? will send a video and pictures of the piston and the cylinder head. let me know if more information is needed.

1: Thank you for that information. Please attach another photo of the piston, this time use a pointer or screw driver to show the crank on this piston.

Was there any misfires out of this cylinder?

Was the spark plug fouled on this cylinder?

Did you find the root cause of the overheating?

Let me know.

*** Web - Advice created on 11/19/2021 14:25:26 and created by Juan Vazquez ***
1: One more thing, please verify that a smart check code search is conducted during this visit and VDN is uploaded. A code search must be created prior to performing any engine repairs, even if here are no DTCs in the system. If a VDN is not created and uploaded, warranty claim submission issues will occur, thank you.

*** Service Alert Escalated to CA as: 14497172 on 11/20/2021 01:09:09 (PST)

*** 11/22/2021 06:55:07 ***
Web - Note created on 11/22/2021 06:55:06 and created by omar cabello
found a different dealership replaced the radiator on the first visit, on the second that same dealership replaced the thermostat and gasket. i want to believe that dealership fixed the root cause of the overheating. i don't know why the radiator was replaced the first time, but i think the damage happed to the head gasket because the radiator failed. did check for DTC's . VDN was created. no misfires and the spark plugs are good.

uploaded picture that you wanted

*** Web - Advice created on 11/22/2021 22:03:42 and created by Juan Vazquez ***
1: Thank you Omar for that information. Please check the cylinder head surface directly above the mark on the piston to verify no damage to the head.

The attached images do not show this mark on the piston as going through or of any considerable depth as to cause any issues. If you believe this piston will cause any problems in the future, let me know.

If OK, verify head and block surfaces are straight (not warped), if no problems, clean block treads before assembling and continue with head gasket replacement. No PWA needed for this repair.

*** 11/23/2021 07:08:08 ***
Web - Note created on 11/23/2021 07:08:08 and created by omar cabello
I believe the potential for this piston to cause problems in the future is possible, that is just my opinion. found both cylinder heads are warped. specifications for cylinder heads is less then 0.05mm. both cylinder heads measurements were 0.13mm. please advise on how to proceed.

*** Web - Advice created on 11/23/2021 13:05:04 and created by Juan Vazquez ***
1: Thank you Omar for that information. Was there any print on the head directly above the park on the piston to suggest something was sandwich between the two?

If not, is this a casting mark on this piston?

*** 11/23/2021 14:19:16 ***
Web - Note created on 11/23/2021 14:19:15 and created by omar cabello
there is no signs of damage on the cylinder head or the cylinder wall for the piston is question. it is not a casting mark. should i replace the short block, what is you recommendation?

*** Web - Advice created on 11/24/2021 07:55:57 and created by Juan Vazquez ***
1: Omar, case is being reviewed by a supervisor, I will get back to you ASAP

*** Web - Advice created on 11/24/2021 08:02:37 and created by Eric Patterson ***
1: Omar, If there is any cylinder wall damage please add clear pictures to the case for review.

Also were any of the head bolts slightly loose when you took it apart?

Thank you

*** 11/24/2021 09:34:39 ***
Web - Note created on 11/24/2021 09:34:39 and created by omar cabello
There was maybe one or two head bolts that didn't take as much effort as the others did to remove them. I have uploaded the pictures of the number 4 cylinder walls. Is there a problem with the head bolts or the threads in the engine block? I'm just asking because you asked about the head bolts.

*** 11/24/2021 09:37:01 ***
Web - Note created on 11/24/2021 09:37:01 and created by omar cabello
there is no damage to the #4 cylinder walls.

*** Web - Advice created on 11/24/2021 20:21:47 and created by Juan Vazquez ***
1: Thank you for that information. Lead agent for this platform has also reviewed this case and we feel that this mark on the piston has been there for 16,000 miles and it has not caused any problems, we do not see it causing a problem in the future.

Please clean all the treads on the block, blow out any debris inside them, lubricate the treads and run a bolt in and out on all the bolts before installing the head to verify treads in the block are in sound condition.

Please continue with repairs, no PWA needed for head repairs.

*** 12/02/2021 12:36:24 ***
Web - Note created on 12/02/2021 12:36:23 and created by omar cabello
based on your advice i will proceed with the repairs and not be concern about the mark on the number 4 piston.

1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head

bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

1: Damien,
Have you performed a block leak test? If you do perform a block leak test, please record the test being performed and include the VIN in the same continuous video.

*** Web - Advice created on 11/26/2021 08:05:33 and created by John Rehm ***
1: Damian,
Have you performed a block leak test? If you do perform a block leak test, please record the test being performed and include the VIN in the same continuous video.
Also,
please request a Carfax report and attach to the case for review. Records with Kia show very little maintenance at the dealerships. If Carfax/records are incomplete, Please ask the customer to authorize removing the valve cover for the engine condition to be inspected, and if approved, please add a short video of the VIN plate and the valvetrain and the underside of the valve cover. Thank you

*** Web - Advice created on 11/26/2021 11:07:52 and created by John Rehm ***
1: Damian, I did not clearly see the block leak tester fluid change colors. It looked like some coolant was being sucked into the tester and may have discolored the fluid. To prevent this you can use a funnel above the radiator neck to prevent fluid from being sucked into tester. If fluid does NOT change color clearly to show the presence of exhaust gasses, then a leak down test may be needed to show this clearly.
If the head gasket is leaking externally, please note this and SKIP the block leak or leak down video. If external leakage is found from head gasket, please clearly show this in a picture or short video.

*** 11/26/2021 11:46:35 ***
Web - Note created on 11/26/2021 11:46:34 and created by Damian Barrientos
The block test was from gases radiator was almost empty. Pressurized cooling system and sent video of external leakage from headgasket.

*** 11/26/2021 11:46:54 ***

*** Web - Advice created on 11/26/2021 13:27:30 and created by John Rehm ***
1: Thank you Damian,
We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 11/29/2021 06:59:58 ***
Web - Note created on 11/29/2021 06:59:58 and created by Damian Barrientos
Sent video of torquing the head bolts. The ones towards the intake they torque.but the bottom ones just keep spinning. Only torque to 19 found pounds and then drop to 10 foot pounds.

Is video ok?

*** Web - Advice created on 11/29/2021 10:18:27 and created by John Rehm ***
1: Damian ,
Please request a long block for this repair if available. If they decline a long block then follow below.
If the heads are not warped I would recommend sending them out for pressure checking replace seals and check the guides. If they are warped I would recommend a long block be used if available. If there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly.
Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

<For Internal Use Only

Vehicle is intermittently overheating. Also has a cylinder 1 misfire. Runs rough.

*** 11/27/2021 13:56:08 ***
Web - Diagnostics created on 11/27/2021 13:54:50 and created by MARK WHITE
Found the engine misfiring in cylinder 1 that fades away as the vehicle runs for a bit. Found there to be coolant leaking outside the engine from the head gasket on the right bank. Removed the intake to get at cylinder 1. Found there to be coolant accumulation inside the cylinder. Would recommend engine replacement at this time. Will attach pictures.

Customer states oil and coolant mixed together, engine running rough.

*** 12/02/2021 13:47:36 ***
Web - Diagnostics created on 12/02/2021 13:33:49 and created by Christopher McKenney
Verified complaints, scanned all systems for DTCs, found P0116 and P0193 stored in system (VDN # B28VAPA050211202002I) verified oil and coolant in coolant reservoir, looked for external oil and/or coolant leaks, found fluid leaking from back corner (cylinder 5) of engine between cylinder head and block. Removed intake plenum and bank 1 valve cover, unbolted cam caps and moved cam aside. Checked for loose/stripped head bolts between cylinders 3 and 5, found head bolt between cylinders 3 and 5 on exhaust side loose, attempted to tighten bolt to see if it would hold torque, but bolt just kept spinning and did not tighten. Video of valve train attached.

1: Matthew,
Warranty validation shows a different name than what's listed under the vin number.
You will need to contact Consumer Affairs or Kia warranty to validate warranty coverage and to have the name corrected in Warranty Validation. If its determined the customer has valid warranty than make sure they correct the name in Warranty Validation.
Thank you

is there any update on this issue yet.

*** Web - Advice created on 12/31/2021 12:06:30 and created by Jerry Gossling ***
1: Matthew,
The name on the registration, on the repair order and in the case do not match.
You will need to contact Kia warranty to resolve this concern.
Thank you

*** 01/05/2022 14:34:58 ***
Web - Note created on 01/05/2022 14:34:58 and created by Shelby Ross
The customers registration is under her married name. Wagner is her maiden name, in which she purchased the vehicle under, Prillaman is her married name. What is the fastest and easiest way to resolve this issue? I have already contacted our DPSM once to get the 10/100 validated as she leased the vehicle prior to purchasing once her lease expired.

Thank you.

*** Web - Advice created on 01/06/2022 04:30:41 and created by Jerry Gossling ***
1: Shelby,
You will need to contact Kia Consumer Affairs or Warranty as I cannot override the system to authorize the engine replacement.
After the warranty coverage is resolved, I will need you to perform the following procedure.
>>>Please access the cylinder head bolts and see if the bolts will retain 50 FT LBS of torque by using a torque wrench.
If an issue is found remove the head bolts and provide a picture
Of the head bolt threads. Thank you.

*** 01/18/2022 04:28:21 ***
Web - Note created on 01/18/2022 04:28:20 and created by matthew creech
i will get my advisor to work on that.

*** 01/18/2022 05:15:08 ***
Web - Note created on 01/18/2022 05:15:08 and created by Joseph Ducey
Called Consumer Affairs, VIS is updated to Ashley Wagner and showing 10/100 coverage. Uploaded updated vis showing that coverage.

Web - Note created on 02/15/2022 12:28:45 and created by Shelby Ross
Yes, Wagner is her married name. I reprinted the VIS showing warranty validation. I have already contacted the DPSM and he has resolved this issue as of Feb. 8th. What else would I need to do to get this resolved? The car has been down for quite a while now, we have taken every step needed to get the warranty validation to show and there still seems to be an issue. Can I upload a copy of the VIS showing that she has 10/100?!

*** 02/15/2022 13:09:34 ***
Web - Note created on 02/15/2022 13:09:33 and created by Shelby Ross
So, I have contacted my DPSM and figured this out. I do have a validated VIS here and the registration with the last name as Prillaman, which is her maiden name. Can I upload that to the case or do I need to edit the techline case information in order for yall to see the validation for 10/100?

*** 02/15/2022 13:53:08 ***

1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** 01/04/2022 04:31:01 ***

1: What is leaking? I cannot tell what area this is from the video

*** 12/29/2021 07:55:58 ***
Web - Note created on 12/29/2021 07:55:58 and created by Harvinder Singh
the head gasket is leaking from bank 1

*** Web - Advice created on 12/29/2021 08:23:19 and created by Frank Lusic ***
1: Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 12/30/2021 09:27:24 ***
Web - Note created on 12/30/2021 09:27:23 and created by Harvinder Singh
Removed the cams to inspect the head bolts. Bolt numbers 5-6-7-8 were torqued to specs. Bolts 1-2-4-3 were loose. Went to tighten the bolts to spec. Only #3 bolt tightened however the rest of the bolts threads wont hold in block. Seems like the bolts are going to snap.

car was overheating and smoking white from tail pipe. found 80% leak down to radiator in cylinders 1, 3 and 5. front valve cover was off when i inherited the car from another tech that no longer works here or i would send a video. when i turned the engine by hand coolant poured from cyls. 3 and 5 so i suspect this engine has probably been hydro locked at some point. please advise.

car is loosing coolant causing no heat.

*** 12/22/2021 06:23:05 ***
Web - Diagnostics created on 12/22/2021 06:20:28 and created by Steven Williams
pulled car into shop and checked car for proper coolant level. found that coolant level was low. topped off coolant and performed cooling system pressure test to car. found that pressure was dropping but there was no signs of coolant leaking. checked oil dipstick for any oil coolant mixture. had funnel sitting on radiator and checked operation. found that when car was running there where bubbles coming out of radiator. performed cooling system block tester and found that when testing that there is signs of a head gasket issue. removed front valve cover from head and checked head bolt torque. found that 2 head bolts just spun and would not tighten. how should we proceed

1: Since there are no threads on the head bolts please send a video showing the head bolt inside the slot it's threads are stripped from and then spin the bolt into the slot where the threads are stripped and keep ratcheting it in to show that it just spins but doesn't grab on to anything. You can you a regular ratchet so you can spin it in quicker. Show it spinning for at least 10 seconds. Then Warranty will allow us to approve an engine.

1: I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please refer to service info and TSB ENG083.
<For Internal Use Only
If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks>

Customer states vehicle died in flight would not start back up.

*** 12/20/2021 15:31:17 ***
Web - Diagnostics created on 12/20/2021 14:58:51 and created by Jason Wood
Verified customers concern tried starting vehicle, cranking abnormally. Performed compression test and found cylinder 1 at 20 psi, cylinder 2 at 150 psi, cylinder 3 at 140 psi, cylinder 4 at 150 psi, cylinder 5 at 145 psi, cylinder 6 at 155 psi. Performed leak-down test and found cylinder 1 leaking in the cooling system with a leak rating of 90%. Removed cam assemblies for Bank 1 and checked torque on head bolts. Found corner head bolt by cylinder 1 to brake loose and have a torque rating of 20ftlbs. I have attached a photo of the head bolt with threads that have been pulled out of cylinder block.

1: Thank you Case under review.
<For Internal Use Only
Jerry, Looks like they did have the heads sent out. Unsure where the metal came from. But it does look almost like melted aluminum.>

*** Web - Advice created on 01/12/2022 12:19:08 and created by Jerry Gossling ***
1: Giovanny,
After thoroughly reviewing this case with the DPSM, I am denying the request for PWA parts warranty engine replacement.
The cylinder head should not have been resurfaced and the oil pump should have been replaced.
There's obvious scoring in the cam journals which leads me to believe this was due to lack of oil pressure.
If you have any further question please contact Kia warranty or your DPSM.
Thank you

Found vehicle would overheat while driving down the interstate

*** 01/07/2022 14:59:30 ***
Web - Diagnostics created on 01/07/2022 14:59:30 and created by Shawn Herkes
Confirmed vehicle overheats, inspected connectors, all connectors are secure. Pulled codes, found no codes. Verified cooling fans are working. Found that lower radiator hose was not getting hot even though vehicle was overheating. Performed coolant bleed mode, vehicle said bleed mode was performed successfully. Vehicle would still overheat and lower radiator hose would not get hot. Followed KGIS steps to diagnosing faulty thermostat. Removed thermostat and put in hot water. Got the water over 235 degrees for 3 minutes and found thermostat would not open up. Replaced thermostat and re-tested. Ran into all the same issues again. Checked KGIS for any issues, found nothing. Pulled codes again, no codes found.

1: Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any please attach a clear picture to the case for review.
2: Next, . Please let the vehicle cool down a bit and please remove the radiator cap, start the engine and lower the coolant level a bit and run the vehicle until the coolant is visible but low in the radiator. Then perform a Block check as the RPM's are at 1500 and perform the check and see if the color changes on the fluid.

*** 01/08/2022 09:12:43 ***

1: Perfect, Thank you I remember that the small drivebelt could be missing for the pump only

*** 01/11/2022 08:10:51 ***
Web - Note created on 01/11/2022 08:10:51 and created by Shawn Herkes
No, everything is there. Am I good to order an engine or do you still need something?

*** Web - Advice created on 01/11/2022 11:32:28 and created by Eric Patterson ***
1: I have no reason t replace the engine at this time. Have you performed the block check?

Are the fans operational?
KDS actuation and low and high speeds work?

*** 01/11/2022 12:57:15 ***
Web - Note created on 01/11/2022 12:57:14 and created by Shawn Herkes
Performed block check, fluid color did not change. Fans are operational, low and high speed are working. Reason I ask about the motor is the last vehicle I had with a leak around the head, they requested I remove the valve cover, torque the head bolts 25ft-lbs and see if they stripped out. If they did then I was supposed to replace the short block as well. Only reason I asked.

*** Web - Advice created on 01/11/2022 14:53:26 and created by Eric Patterson ***
1: Got you

The only thing I have left is to check all head bolts.

2: : We will need to tear down the engine. Please try and torque down the engine head bolts to 50 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

C/S No heat at idle. 2nd time in for concern.

*** 01/19/2022 12:37:46 ***
Web - Diagnostics created on 01/19/2022 12:31:17 and created by Don Verville
Vehicle was in 1/10 for same concern. Inspection found radiator cap loose and low coolant. Took about 3/4 of a gallon. Performed bleed procedure with fill funnel and got heat. Droive vehicle and confirmed good heat. Allowed to idle for 20 minutes, still good heat. Vehicle released to customer.
Vehicle returned within 1 week, and 100 miles with concern returned. Customer also stated concern previously addressed at Rowe Kia of Auburn Me. Copy of invoice indicates same concern, with same result. They even flushed the heatercore.

Revving the vehicle for a few minutes gets heat to return. Revving with fill funnel gets it to return and stay. Vehicle is some how becoming air bound.

Removed plugs and pressurized cooling system. Inspect each cylinder for coolant intrusion. none at this time.
Perform leak down testing of each cylinder with coolant fill funnel partially full.
Monitor fill funnel for 5-8 minutes. No evidence of coolant level change, or air bubbles.

1: Hello Don
Please perform the Block Test inspection, please use this method, with the vehicle fully warmed up, test drive the vehicle again and perform a couple hard accelerations and then when the vehicle is back in the service bay remove the cap from the coolant recovery tank and immediately test the air inside the recover tank, Please report your findings

*** Service Alert Escalated to CA as: 14598861 on 01/20/2022 01:07:47 (PST)

*** 01/20/2022 10:38:06 ***
Web - Note created on 01/20/2022 10:38:06 and created by Don Verville
Started and allowed vehicle to get to operating temp, then road tested normally for ab out 4 miles. Upon returning went to the empty inventory lot and perfomed 6 0-60 full throttle accelerations. Immediately pulled in and performed block test as described, with no result. Vehicle was left to idle just outside my bay. Got in to take it to lunch and heat was super hot. Drove approximately 5 miles to my house and left it running in the drive. No heat at idle. Came out 30 minutes later and you could cook bacon on the vents Note- My driveway is a typical florida incline. Returned to shop and left partially on alignment rack (vehicle on incline.) Perfom block test. No result. Pulled cap off and tested again, no result. Pulled some coolant out and attached fill funnel, then set throttle depressor to maintain 2k rpm. Retest at radiator again, no result. Noticed bubbling from coolant, retest with block tester directly over bubbles, no result. Heat is back to hot. I'm going to keep testing i hopes of catching something. Please advise next step.

1: I am not familiar with this brand
try this , try testing the exhaust gasses coming out of the tail pipe, to see if the fluid changes very quickly , it should change with only one pump

*** 01/20/2022 12:07:57 ***
Web - Note created on 01/20/2022 12:07:57 and created by Don Verville
My block tester uses vacuum to draw the air through, in this case the brake fluid machine, so there is no bulb to squeeze. Placed it in front of the tail pipe and it turned almost instantly. I think the actual brand is Lisle.

*** Web - Advice created on 01/20/2022 12:14:59 and created by Frank Lusic ***
1: Thank you
pressure test the cooling system, let the vehicle sit for several hours while maintaining the max pressure ,
start the engine to see if there are any misfires and if the exhaust smell like coolant

*** 01/20/2022 12:45:04 ***
Web - Note created on 01/20/2022 12:45:03 and created by Don Verville
My pressure tester is actually air powered, so I'm going to leave at 20psi over night. Instead of looking for misfires, Id prefer to pull the plugs again and inspect with a borescope. Unless of course you prefer I run it.

*** Web - Advice created on 01/20/2022 15:21:19 and created by Frank Lusic ***
1: That is fine Thank you

*** 01/21/2022 05:20:47 ***
Web - Note created on 01/21/2022 05:20:47 and created by Don Verville
Frank, System was pressurized overnight. Pulled the plugs first thing this morning and inspected with a bore scope. My camera allows me to switch from down facing camera to side facing camera. No signs of coolant running down cylinder walls, or pooling on the pistons. Cylinder 1 did show some staying and light scoring on the cylinder walls, and the piston appeared "damp," but no pooling. I've been doing this a long time and can typically find the failure quickly. This one, however, is wearing me out. I honestly believe combustion pressure is leaking into the cooling system somewhere, but I can find where. This is extremely frustrating.

*** Web - Advice created on 01/21/2022 06:14:43 and created by Frank Lusic ***
1: Thank you Don , I agree I too believe that this engine has a failed head gasket of possibly a head bolt that has pulled out of the block due to failed threads in the block
2: Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

Attached is a photo of the removed and replafed thermostat. Please note the substance attached to and flaking off of the the thermostat body. I suspect there is a foreign substance, and/or residue from incorrect coolant, built up within the cooling system. Unknown if flushing will remove the scale build up, or even what the extent of contamination is.

1: Don If this is not your cell number (978) 479-1258 Please add it to the case notes. I have escalated the case for an FTS to review as well.

*** 04/08/2022 07:49:52 ***
Web - Note created on 04/08/2022 07:49:51 and created by Don Verville
Eric, There is nothing wrong with the New engine in this vehicle. The long block, that just got to us end of last week, did not come with a thermostat or housing. When I removed the thermostat from the failed block, I noticed the flakey build up, and it presented an explanation for loss of heat at idle. I replaced it with a new one, prior to installing the thermostat housing/ water cross over, on the new engine. I requested to reopen the case because I wanted to attach the photo of the thermostat for documentation purposes only. I believe the cooling system in this vehicle has been contaminated with something other than Kia Coolant, and ultimately this is what is disrupting the flow of coolant through the heater core. The vehicle does not have 5/60 warranty left. We will be reviewing the findings with the owner, but she Lives in Maine, and only spends her winters here in florida. I believe she is looking ot head home. Yes. That is my phone number.

*** Web - FTS Summary created on 04/08/2022 12:34:44 and created by Jeffrey Nelson ***
Spoke with tech over the phone and discussed the case and vehicle history. Since there is evidence of some kind of contaminate in the cooling system that may be causing the restriction I am recommending the heater core and radiator be replaced. During replacement all hoses should be inspected for any restrictions and replaced if needed. Tech stated the customer is traveling back to Main and thinks the customer has already picked up the vehicle. So I am canceling the escalation at this time. If concerns are still present after the recommendations are done please reopen the case.

1: Justin,
Actuate the cooling fan using the KDS to see if it functions on low & high speeds.

Thoroughly inspect the vehicle for any damage or recent repairs.
Check the radiator for leaks or damage.
Provide a clear picture of the stripped head blots for review.
Thank you

1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** Web - Advice created on 03/02/2022 09:28:07 and created by Frank Lusic ***
1: Since the short block was assembled at your dealership and many of the seal and gasket that were installed during assembly are now leaking. The engine needs to be removed, disassembled and resealed correctly. Then test driven to confirm that the engine has been resealed properly this time and there are no more leaks

1: Michael,
Please access the cylinder head bolts and see if the bolts will retain 50 FT LBS of torque by using a torque wrench.
If an issue is found remove the head bolts and provide a picture
Of the head bolt threads. Thank you.

*** 02/10/2022 06:13:53 ***

*** Web - Advice created on 02/10/2022 08:28:52 and created by Jerry Gossling ***

1: Michael,
Based off of your provided information, I recommend to replace the short block and to check the cylinder heads for warpage using a machinist straight edge per the shop manual inspection procedure.
Note any components contaminated with oil will require replacement.
NOTE, the radiator & heater core can be flushed using liquide detergent and hot water.
Thank you
Note, your dealer is DSA " Dealer Self Authorizing " So your dealer does not require a PWA case. The only person who has to authorize this repair is your service manager.

Web - Problem Description created on 02/08/2022 13:27:32 and created by Brett Gerasim
Vehicle originally came to us with complaints of a burning smell. We isolated the smell to a coolant leak from a leaking head gasket on the back bank (Bank 1) of the engine.

*** 02/08/2022 13:40:55 ***
Web - Diagnostics created on 02/08/2022 13:27:32 and created by Brett Gerasim
Before removing the cylinder head, I did check to make sure that the head bolts were all holding by setting a torque wrench to 38 Nm and making sure that the wrench buzzed/clicked without the bolts turning at all. Spec from KGIS is 37.3 - 41.2 Nm plus 120 deg plus 90 deg, so they should all be in excess of ~38 Nm once sent to yield. We have seen faulires of the block threads before. No bolts spun at all for this test, which we have performed in the past for techline on similar head gasket failures.

Confirmed that the block and head were within tolerance. Installed the new head gasket. All the new head bolts went to 38 Nm without incident. While performing the first yield step, the fourth bolt in the torque pattern only made it to 77 degrees on the torque angle indicator before it began to turn freely. Please advise how to proceed. At a minimum, the block, head gasket, and the bolts sent to yield will need to be replaced.

Thank you for your help in this matter.

1: Thank you for the video attachment. The video you have sent in is acceptable showing the cylinder block treads have come

out and engine needs replacement.

Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083. Thank you.

1: Robert, I am not sure about the warranty. From what I see the name is entered correctly but this vehicle has no further warranty. WEBDCS shows an owner transfer and no further warranty. I can not adjust this. As far as I can tell this will not be covered. If CA is working on an adjustment to warranty then any type of coverage would depend on that adjustment. As mentioned I do not believe that to be the case.

A water pump not circulating can cause symptoms of coolant to overflow also. Make sure you check the basics if an internal engine failure can not be confirmed. Leak down testing can be performed to determine if there is any leakage from the combustion chamber into the cooling system.

1: Robert,
We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** Web - Advice created on 02/17/2022 15:55:43 and created by John Rehm ***
1: Robin,
We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** Web - Advice created on 02/17/2022 15:56:00 and created by John Rehm ***
1: Also, please request the most recent oil service record from the customer and attach to the case for review.

1: If the heads are not warped, I would recommend sending them out for pressure checking replace seals and check the guides. If they are warped, I would recommend a long block be used if available. If there is no long block available, the heads will need to be replaced and the valvetrain components swapped over. Please make sure the new camshafts are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly.
Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated and approved a PWA case for you.

c/s car overheating and consistently loosing coolant

*** 02/17/2022 12:42:42 ***
Web - Diagnostics created on 02/17/2022 12:42:26 and created by Rafael Nunez
pressurized cooling system and lifted vehicle to inspect for signs of coolant leaks. found coolant leaking from headgasket area on bank 1 cylinder head. advised customer potential head gasket issue present but would have to remove cylinder head to inspect for further damages. upon removal, found 7 of 16 cylinder head bolts loose and found 1 head bolt stripped completely(see photo attached). removed both cylinder heads and found both headgaskets blown as part of diagnosis. inspected cylinder heads for flatness and using straight edge found both cylinder heads with just about .06mm worth of unevenness. looked up specification on kgis and found spec to be less than .05mm showing both cylinder heads exceed maximum limit. now should i replace long block assmebly or order two cylinder heads with shortblock assembly?

*** 02/17/2022 15:55:16 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin Default

*** Web - Advice created on 02/17/2022 15:59:06 and created by Eddie Milton ***
1: Rafael, I greatly appreciate all your hard work.

Since you are a DSA A dealer, you do not need a PWA approval to replace the engine. Considering that both heads are warped beyond spec, I would recommend replacing with a long block if available.

Vehicle came to us with complaint of overheating.

*** 02/18/2022 13:18:42 ***
Web - Diagnostics created on 02/18/2022 13:18:42 and created by Brett Gerasim
Confirm that the temperature does creep well above normal when the vehicle is idling. Verified engine coolant level and found it to be low. There is a lot of coolant residue at the fill neck and surrounding plastic apron. Removed the radiator cap and a large gas pocket was released that smells like oil vapor. Verified proper operation of the engine cooling fan. which is working correctly. Performed an engine block test which the vehicle failed.

Please advise how to proceed. Thank you

1: Hello, Brett. Please attach a picture showing the failed block test.

2: Please remove the valve cover on the leaking bank, then use a torque wrench to check the torque on each head bolt. If any are loose, please attach a video displaying the torque on the wrench and the head bolt continuously tightening.

3: Please also remove the bolt and show the stripped threads in a picture.

*** Web - Advice created on 02/18/2022 06:51:34 and created by Greg Phillips ***
1: Marco, I would check the head bolts on that bank. With the right socket, you should be able to get to some of them without removing the camshafts. And I would check to see if those cylinders have coolant puddled in them, or if coolant pours into them when you pressurize the system.

*** 02/18/2022 07:44:41 ***
Web - Note created on 02/18/2022 07:44:41 and created by Marco Lopez
So from previous repairs I've made to these engines, I usually pull those head bolts and the block threads come out with them, is that what you're wanting me to check for at this point? I will also pressurize the system and check the back cylinders once I have a chance to pull manifold.

*** Web - Advice created on 02/18/2022 07:57:08 and created by Greg Phillips ***
1: Yes, I'm looking for possible pulled thread bolts from the block. As for checking for coolant entering the cylinders first, if it ends up being very excessive, then the block thread test isn't really necessary. Because coolant doesn't compress. If any of the cylinders fill with coolant very quickly, then there is likely rod damage on this already as well.

*** 02/18/2022 08:04:11 ***
Web - Note created on 02/18/2022 08:04:11 and created by Marco Lopez
Okay thank you Greg, I will perform the coolant pressure test first and update you with my findings when I can.

Web - Note created on 02/15/2022 13:43:43 and created by Ryley St John
I do not believe so. the pictures do make the color seem lighter but in person it is definitely solid brown. and also the transmission oil cooler does not run through the radiator on this vehicle

*** Web - Advice created on 02/15/2022 14:01:35 and created by Frank Lusic ***
1: Thank you

Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** Web - Advice created on 03/01/2022 13:22:29 and created by Sam Camarillo ***
1: Please gain access to the head bolts closest to the area of the head gasket leak (probably where the misfire is). Apply 45-50ft lbs of torque to them, see if they loosen or spin. If any do the threads in the cylinder block have stripped, will need short block replacement. Let me know what you find.

1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** Web - Advice created on 03/08/2022 16:44:50 and created by John Rehm ***
1: John,
please show a short video of the pressure test being performed and showing coolant entering the cylinder as noted. Set up a borescope in that cylinder so you can be hands free to record the video.
Then after showing this,
Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold.

*** 03/15/2022 12:54:37 ***
Web - Note created on 03/15/2022 12:54:37 and created by Kevin Griese
AFTER WORKING WITH ENGINE FOUND THAT NO-START ISSUE WAS INDEED CAUSED BY ME. MY TIMING WAS OFF AFTER ALL. HOWEVER NEW PROBLEM PERSISTS. VEHICLE DROVE FINE ALL WEEK AND ON FINAL TEST DRIVE (DRIVE 6) VEHICLE LOST POWER AND MIL ILLUMINATED IN DASH. FOUND CODE P2146 (FUEL INJECTOR GROUP 'A' SUPPLY VOLTAGE CIRCUIT/ OPEN. INJECTOR 2 AND 5). PERFORMED ELECTRICAL TEST OF INJECTORS 2 AND 5. RESISTANCE SPEC 0.98- 1.4 OHMS. FOUND RESISTANCE TO BE WITHIN SPECIFICATION. PER DIAGNOSIS FLOWCHART, REPLACED IDB CONTROL UNI WITH KNOWN GOOD AND TEST DROVE. VEHICLE DROVE PERFECT FOR THE FIRST MILE, THEN WHEN STOPPED AT TRAFFIC LIGHT, BOTH INJECTORS 2 AND 5 CUT OUT. VEHICLE RAN VERY ROUGH. NOT SURE HOW TO PROCEED AS AFTER ELECTRICAL TESTING, INJECTORS TEST GOOD. ACCORDING TO WIRING DIAGRAM, INJECTORS 2 AND 5 DO NOT SHARE ANY OF THE SAME WIRING, NOR DO THEY APPEAR TO INTERACT WITH EACH OTHER

*** Web - Advice created on 03/15/2022 13:16:47 and created by Frank Lusic ***
1: 1, run the engine until it reaches operating temperature
2, disconnect the IDB connector E70
3, check the resistance between the following pins
1, 32-47
3, 16-33
5, 20-35
2, 19-34
4, 31-46
6, 17-18

*** 03/15/2022 13:41:43 ***
Web - Note created on 03/15/2022 13:41:43 and created by Kevin Griese
PERFORMED RESISTANCE TESTS OF PINS AS REQUESTED. AS FOLLOWS:
1, 32-47 = 1.5 OHMS
3, 16-33 = 1.5 OHMS
5, 20-35 = 1.4 OHMS
2, 19-34 = 1.5 OHMS
4, 31-46 = 1.5 OHMS
6, 17-18 = 1.6 OHMS

*** Web - Advice created on 03/15/2022 14:08:53 and created by Frank Lusic ***
1: Thank you, the resistance of 2 and 5 are very close to the other injector circuits
retest 2 and 5 again but this time wiggle the harness and the connectors associated with these injectors to see if the resistance will change at all

*** 03/15/2022 14:12:32 ***
Web - Note created on 03/15/2022 14:12:32 and created by Kevin Griese
Tested 2 and 5 again, this time wiggling the harness as requested. I did not see any fluctuation in resistance. They stayed at 1.5 ohms

*** Web - Advice created on 03/15/2022 14:28:58 and created by Frank Lusic ***
1: Thanks for trying I have seen pin fit issues cause these types of codes
disconnect all of the connectors associated with these two injectors
check for loose pin fit using the proper tool , adjust if loose
add Stabilant to the male pins,
clear the code and reset the adaptive values, retest

*** 03/21/2022 15:08:39 ***
Web - Note created on 03/21/2022 15:08:39 and created by Kevin Griese
NO OPTION AVAILABLE IN ECU TO RESET ADAPTIVE VALUES. REMOVED INJECTORS AND JECKED PINS. FOUND ALL PINS TO BE SECURE, SWAPPED INJECTORS 2 AND 5 WITH 3 AND 4. FOUND CYLINDERS 2 AND 5 TO STILL DISPLAY NO INJECTOR FIRING TIME. ISSUE NOT WITH INJECORS. PERFORMED TEST OF WIRING FROM ECU (CONNECTOR C500-B) TO CONNECTOR IN FUSE BOX (EC11) AND FOUND NO CONCLUSIVE RESULTS. WOULD LIKE

1: Hello Nicholas
once you have approval from DMA
2: Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

1: Thank you for that information. Is this steam or oil smoke coming form the tail pipe?

Steam will go up and dissipate within a couple of seconds, and if grabbed with your hands, you will feel them get wet.

Smoke will remain low, normally blue when looked through sun light and will linger longer.

If this is steam, perform the following:

- Please look under the vehicle for any signs of coolant leakage from the head gaskets. If there is any, please attach a

clear picture to the case for review.

- If there is no leak, perform a chemical block check and attach a short video showing VIN and the fluid changing colors.

NOTE: If a leak cannot be found, you may have to pressurize the cooling system overnight, remove spark plugs and inspect the top of the pistons for coolant. Please attach photos to the case for review.

1: Thank you for the information. We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

If unable to torque the head bolts because they are striped. Please remove stripped bolts and attach photos showing block aluminum treads on the bolt(s), then I will approve a PWA case for the short block replacement, thank you.

*** Web - Advice created on 03/22/2022 07:16:11 and created by Juan Vazquez ***
1: Thank you for the video attachment. The video you have sent in is acceptable showing the cylinder block treads have come out and engine needs replacement.

I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083. Thank you.

Web - Diagnostics created on 03/22/2022 12:21:28 and created by Todd Neff
see history on this vin. i didnt do all other work on this. tech that did is no longer here. had multiple short blocks and heads/front end taken off and on multiple times. it really needs a long block esp now that theres "milk" throughout engine due to coolant oil mixing.

1: I see 2 short blocks replaced at 49090 miles and now 52268 blown head gaskets again. I need to know if these were seed units or remans and if the head bolts were pulling the threads from the block or if they were never torqued to yield meaning you have to test the head bolts.

*** 03/23/2022 10:06:56 ***
Web - Note created on 03/23/2022 10:06:56 and created by Todd Neff
First one was replaced due to pulling threads on cylinder 3. The original engine. Both were reman. Second block replaced for oiling issues. Head bolts were torqued to yeild

*** Web - Advice created on 03/23/2022 10:27:08 and created by Tony Thomas ***
1: 2 short blocks by the same tech @ 49090 miles with FTS involvement and now back in 3578 miles with coolant and oil mixed. I need a photo of the blue R-DOT reman tag and for you to test the head bolt torque to determine what failed causing oil and coolant to mix. I suspect the heads may not have been torqued properly and I do not know how you would know that they were, as you state.

*** 03/23/2022 06:59:31 ***
Web - Problem Description created on 03/23/2022 06:51:00 and created by Jacob Hamilton
The customer states that the vehicle is overheating and running out of coolant.

*** 03/23/2022 06:59:31 ***
Web - Diagnostics created on 03/23/2022 06:51:00 and created by Jacob Hamilton
Found white smoke coming out of the exhaust at times. Performed visual inspection and found that there is coolant and oil coming out of the back of the rear head area. Cleaned up to see if it leaks out right away. Performed compression test and found that cylinder 1 had 32 psi and cylinder 3 had 38 psi. Performed cylinder leak down and found that there was a 93% leak through cylinder 3 when testing cylinder 1. Determined that head gasket was blown, removed heads from cylinder block and found that head bolt threads in between cylinder 1 and 3 attached photos. Inspected both heads' flatness with a straight edge and found that they were out of spec. Found that the odd bank head was reading 0.1 mm of warp in the center while the even bank had 0.08mm of warpage. The vehicle needs a short block assembly.

1: Hello Nicholas

Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** Service Alert Escalated to CA as: 14717183 on 03/25/2022 01:08:51 (PST)

*** Web - Advice created on 03/25/2022 14:31:03 and created by Jeffrey Minderhoud ***
1: Thank you, I can see the headgasket was leaking and the Head bolt is stripped.
2: Please obtain approval from the DPSM to inspect and remove the heads. If the Block is needed due to the thread concern, I will approve the engine PWA for you. Thank you.

We will need to measure the cylinder heads and the block for warpage and see if they are within specs.
If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

*** Web - Advice created on 03/25/2022 14:33:10 and created by Jeffrey Minderhoud ***
1: I can see there is no sludge in the valve train to indicate a lack of maintenance. Thank you.

1: I called Jeremy to the provided number but there was no answer. I left a voicemail. I advised Jeremy that unfortunately we will not be able to approve the PWA based on all the information from the old TL case from a different dealer. We would need all the information transferred to this case. While reviewing the previous TL case, it look like the tech found that the head bolts were stripped. I advised to attach a photo showing that the head bolts will not torque. You can also remove the bolts and show that the threads pulled and are stuck on the bolt.

came in a while back because the head bolts would not tighten so had techline order a long block for a v6 came in put the engine put the engine in the car left for about 2 weeks came back and they said they have a puddle of oil in their driveway so being that this is a long block didnt mess with no oil cap or drain plug all i had to do was put oil in it raise the car up and saw it was leaking oil where the transmission and the engine block meets like by the flywheel go the guys in the shop and said check the oil pressure switch down in the valley check that and it was dry the only thing i can thing of is the rear main seal but i couldnt mess with that because i bolt the flywheel right in front of it so please teel me what to do i will provide a picture soon

*** 03/31/2022 08:24:17 ***
Web - Diagnostics created on 03/31/2022 08:24:17 and created by Jamian White
the only thing ive done so far was check to see if the oil pressure swtich was leaking in the valley

*** 03/31/2022 12:20:26 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin default

*** Web - Advice created on 03/31/2022 12:21:36 and created by Greg Phillips ***
1: You've made sure there is no oil in the upper valley at all? The filter cap and the canister are two more possibilities up there. I would get in there with a borescope before going much further. Because the next step is going to have to be to access and inspect the back of the engine.

*** 03/31/2022 13:06:23 ***
Web - Note created on 03/31/2022 13:06:23 and created by Jamian White
yes i took the intake off and lower intake off and inspected the valley it was dry no leak or oil inside the valley i did also go in there with the borescope and look it was dry so that leads me to think that is coming from the rear main seal

*** Web - Advice created on 03/31/2022 14:19:28 and created by Greg Phillips ***

1: Possibly. Or a crack, or a porous block, or an issue with the pcv system causing a leak at the rear oil gallery cover plate. It's going to have to be inspected.

*** 04/04/2022 04:58:28 ***
Web - Note created on 04/04/2022 04:58:27 and created by Jamian White
so do you want me to take it back out and check the rear main seal

*** Web - Advice created on 04/04/2022 08:41:52 and created by Greg Phillips ***
1: We have to determine what the leak source is and if it's something we can fix easily, or if the engine needs to be replaced again. I would separate the trans and inspect the engine in the car. But I do understand that in some cases it's easier to drop them together and then separate them. In either case, if you're already sure it's on the back of the engine, we would still have to access it to repair it. I also need a photo of the blue reman tag on this. Or if there isn't a reman tag, I need a photo of the stamped serial number.

*** 04/05/2022 05:35:17 ***
Web - Note created on 04/05/2022 05:35:16 and created by Jamian White
ok i will access the rear main seal and send a photo of the blue reman tag and send it when i find it

*** Web - Advice created on 04/06/2022 09:29:58 and created by Greg Phillips ***
1: So this is coming from the oil gallery plate. Which could just be a bad gasket, or it could be a PCV issue resulting in there being and excessive amount of oil or pressure in the gallery. This came with a new PCV valve right? Did it come with a new valve cover as well? Was the old engine sludged? Please inspect and test the PCV valve. Inspect the PCV hose for kinks or blockage. And inspect the baffle for sludge or blockage. Including the hole where the hose attaches, if it's a new valve cover, for an improperly punched hole (blocked).

*** 04/07/2022 07:30:52 ***
Web - Note created on 04/07/2022 07:30:52 and created by Jamian White
yes it did come with new valve cover this was a long block v6 that i put in the only thing i change over is the lower and upper intake exhaust and the a/c compressor and alternator yes it came wit a new pcv valve

*** Web - Advice created on 04/07/2022 07:39:38 and created by Greg Phillips ***
1: Check the new pcv valve and make sure it's not stuck. Check the hose for restrictions. And check that valve covers to make sure the holes are actually correctly made and are open. If seen this once or twice on the four cylinders where the hole to the baffle in the brand new valve cover wasn't actually fully punched through and it created a restriction in the PCV system.

*** 04/08/2022 06:21:56 ***
Web - Note created on 04/08/2022 06:21:56 and created by Jamian White
ok took the back valve cover off and check the PCV valve and the hose is clear and allowing air to go thro also check the valve cover and air was able to go through the valve cover as well where the PCV valve connect too

*** Web - Advice created on 04/08/2022 09:52:23 and created by Greg Phillips ***
1: Let's remove that back cover plate and see if there is an excessive amount of oil in it, or if maybe the gasket is just missing or damaged. Or the plate itself is damaged. A little bit of oil in there is normal. The plate and gasket should be enough to prevent leakage. But if there is a lot, there is an issue with the engine and it will overwhelm the gasket fairly easily. So if there is only a little, then it may just be a bad gasket or a plate that got damaged when they built it.

*** 04/08/2022 11:12:09 ***

Web - Note created on 04/08/2022 11:12:09 and created by Jamian White
yes I remove the cover plate and there was a lot of oil that came out of the back cover plate and yes the gasket is there behind the cover plate. Can i have additional time for this car for having to break this car back down again?

*** Web - Advice created on 04/08/2022 13:18:31 and created by Greg Phillips ***
1: If the PCV system is good, and there is excessive oil in that gallery, it will need another engine. As for the extra time, Techline can't authorize that, you would need to talk to your Warranty Admin about how to do that.

1: Ryan,
Provide a clear picture of the leaking head gasket for review.

Next please access the cylinder head bolts and see if the bolts will retain 50 FT LBS of torque by using a torque wrench.
If an issue is found remove the head bolts and provide a picture
Of the head bolt threads. Thank you.

*** Web - Advice created on 02/21/2022 16:21:09 and created by Eddie Milton ***
1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** Phone - Advice created on 02/24/2022 11:37:23 and created by Eddie Milton ***
1: Maurice called in to discuss the case. Maurice just wanted to verify what I was asking. I advised to try torquing the head bolts and if any of them do not torque down and just keep spinning, then he can either attach a video showing that they will not torque down or he can pull the bolt and show the pulled threads on the head bolt. Maurice advised that he would attach his findings shortly.

*** 02/28/2022 07:57:38 ***

*** Web - Advice created on 04/09/2022 08:25:06 and created by John Nguyen ***
1: Fernando, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications. If you find any damage please provide a continuous video of the stripped threads and include a clear view of the VIN. Please report your findings

1: Thank you for the information and attachment. We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

If unable to torque the head bolts because they are striped. Please remove stripped bolts and attach photos showing block aluminum treads on the bolt(s), then I will approve a PWA case for the short block replacement, thank you.

*** 04/20/2022 08:25:46 ***
Web - Note created on 04/20/2022 08:25:46 and created by Dave Kasper
Juan, removed camshafts on bank 2 and checked head bolts all were okay none were stripped out was able to torque to 75lbs without a bolt moving.

*** Web - Advice created on 04/20/2022 21:55:09 and created by Juan Vazquez ***
1: Thank you for that update. Please continue with cylinder head gasket repairs.

PWA is not needed for cylinder head repairs.

1: Thomas,
I recommend to use the KDS to actuate the cooling fan on high & low speeds to see if it function correctly.

Next,
Please access the cylinder head bolts (On the cylinder head of concern) and see if the bolts will retain 50 FT LBS of torque by using a torque wrench.
If an issue is found remove the head bolts and provide a picture
Of the head bolt threads. Thank you.

*** 04/18/2022 13:13:02 ***

1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please replace the engine under

normal warranty procedures.

*** Web - Advice created on 06/01/2022 13:14:58 and created by Frank Lusic ***
1: Hello Alec

Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 06/03/2022 08:45:48 ***
Web - Note created on 06/03/2022 08:45:47 and created by Alec Martisauski
Removed cams from front bank. Found several head bolts spinning in place. Video attached. Unable to remove head to check for warpage

*** Web - Advice created on 06/23/2022 12:25:10 and created by Jerry Gossling ***
1: Christopher,
Based off your provided information, I recommend to replace the engine.

Please see if a long block is available and if ones not than make sure to check the cylinder heads for warpage using a machinist straight edge per the procedure listed in the shop manual.

If the cylinder heads are warped than they will also require replacement.
Thank you

Note, your dealer is DSA " Dealer Self Authorizing " So your dealer does not require a PWA case. The only person who has to authorize this repair is your service manager.

1: Reviewing attachment.

*** Web - Advice created on 06/08/2022 11:56:01 and created by Jeffrey Minderhoud ***
1: Thank you.
2: Please obtain approval from the DPSM to inspect and remove the heads.

We will need to measure the cylinder heads and the block for warpage and see if they are within specs.
If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

*** 06/08/2022 11:56:28 ***
Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

There was very little coolant in the radiator or over flow when vehicle arrival. Coolant was added to the system, revealing a strong jet shooting up from the radiator to make a small fountain in coolant funnel. I then tested to see is exhaust fumes were present in the coolant, with a block test .head is bad, motor needs to be replaced.

1: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.
2: Please show the valve train clearly when doing the video to show if there is any sludge buildup.

1: Please obtain approval from the DPSM to inspect and remove the heads.

We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

*** Web - Advice created on 06/08/2022 11:25:56 and created by Jeffrey Minderhoud ***
1: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add a video of the head bolts spinning or a picture of the stripped block threads on the head bolts if they will not hold, then I will approve the PWA case for the short block replacement.
2: Please get a good shot of the valvetrain condition too to show if there is any sludge build up.

*** Web - Advice created on 04/05/2022 15:09:09 and created by John Nguyen ***
1: Adam, please create a VDN report to verify if there are any active DTC's on this vehicle.
2: Perform an engine block test as outline in KGIS under Technician Basics TB022 and report your test results.
3: IF the test fails, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications. If you find any damage please provide a continuous video of the stripped threads and include a clear view of the VIN. Please report your findings

Customer states vehicle loosing coolant and smoking

*** 06/30/2022 07:32:20 ***
Web - Diagnostics created on 06/30/2022 07:08:14 and created by Chase Wysinger
Cranked vehicle and found vehicle smoking lightly out of the tail pipe, smoke smells like coolant. Inspected for any external coolant leaks, none found. Removed radiator cap and found coolant level low. Removed oil cap, found oil looks "milky". Head gasket allowing coolant to enter cylinders and crankcase.

1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** 07/11/2022 10:58:18 ***
Web - Note created on 07/11/2022 10:58:18 and created by Chase Wysinger
When loosening head bolts, found several bolts more loose than others. Attempted to re-torque and found threads did not hold. Attached video of attempting to torque a couple headbolts.

VEHICLE IS OVERHEATING

*** 06/29/2022 13:19:05 ***
Web - Diagnostics created on 06/29/2022 13:19:04 and created by Jose Rubio
Engine overheated. Upon tear down of the engine, I noticed most of the head bolts in the middle came out easily, as if they were loose. Checked threads by re-installing the head bolts and they never even tightened, they just pulled the threads out with them. It seems as if the engine overheating messed up the threads. Please advise on what to do for the next step, thank you.

Vehicle in. verified that the rear head gasket is leaking, Customer is finally able to leave vehicle here for tear down, I would assume you want pictures of the leak and also the head bolts?

*** 07/02/2022 21:47:12 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin default

*** Web - Advice created on 07/02/2022 21:56:47 and created by Brian Lall ***
1: Ryan, thanks for letting me know what you found and that this case is under a new dealer code than the other case. Yes, please provide pictures or a video showing the source of the oil leaks and attach them to the case. If you are sure the head gasket is leaking check to see if any of the head bolts are loose.

If they are loose take a video showing they will not tighten up or remove them and take pictures showing the threads from the block on the head bolts. Then attach the pictures and videos to the case. Thanks.

1: Thank you, we will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. Please add VIDEO of the stripped bolts if they will not hold, show the torque wrench set to 75 ft/lbs and show the attempt to torque the head bolts. Make sure to get a good shot of the valvetrain condition as well to note any sludge that may be present, then attach to the case.

1: Thank you, we will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. Please add VIDEO of the stripped bolts if they will not hold, show the torque wrench set to 75 ft/lbs and show the attempt to torque the head bolts. Make sure to get a good shot of the valvetrain conditon as well to note any sludge that may be present, then attach to the case.

*** 07/21/2022 14:25:46 ***
Web - Note created on 07/21/2022 14:25:46 and created by Eric Stettler
hi jeff, was able to torque all head bolts to 75 ft/lbs, the head bolts that are on rear/rt head toward middle valley side were a little loose, got about 1/4 turn on them before 75 ft/lbs. no oil in ocv's. valvetrain is clean not sludged,will include pics to this case. taking it for granted i'm just doing head gaskets? should i ship heads out to a machiene shop? thank you

1: Please obtain approval from the DPSM to inspect and remove the heads.

We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
2: The valvetrain looked clean with no sludge. Thank you.

*** Web - Advice created on 07/22/2022 14:07:41 and created by John Nguyen ***
1: Mohamen, Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped

beyond specifications. If you find any damage please provide a continuous video of the stripped threads and include a clear view of the VIN. Please report your findings

*** Web - Advice created on 07/22/2022 14:08:46 and created by John Nguyen ***

1: Thank you for the information and attachments. We will need to tear down the engine. Please remove the camshafts and

try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

If unable to torque the head bolts because they are striped. Please remove stripped bolts and attach photos showing block aluminum treads on the bolt(s), then I will approve a PWA case for the short block replacement, thank you.

IMPORTANT: Before you begin this tear down, please attach a clear photo or short video of the engine oil dipstick showing oil level

NOTE: If oil WILL NOT register on dipstick, drain oil into a graduated container and attach a clear image showing how many quarts of oil were drained from this crankcase.

If less than 1.3 quarts, ask customer for the most recent oil change receipt and attach to this case.

1: Hello Brandon
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 07/29/2022 06:34:24 ***
Web - Note created on 07/29/2022 06:34:23 and created by Brandon Richardson
on the front head 4 of the bolts would not hold. do i need t order long block?

*** Web - Advice created on 07/29/2022 07:26:20 and created by Frank Lusic ***
1: Yes use a long block if one is available

2: Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

Web - Problem Description created on 07/14/2022 06:09:06 and created by TIMOTHY RODGERS
customer is complaining about excessive smoke coming out of the tailpipe.
I installed a remanufactured short block about a month ago because the head bolts loosened up from the threads pulling out of the block.

*** 07/14/2022 06:11:23 ***
Web - Diagnostics created on 07/14/2022 06:11:23 and created by Siebel eSupport
Test drove vehicle after burning out any excess sludge from the oil and coolant mixture and performing a valve cleaning. Customer keeps returning for very small amount of smoke coming out of tailpipe at start up which is condensation. I performed a compression test on the vehicle and all cylinders are within 150-160 PSI. No misfires or oil found on sparkplugs.

1: Hello Timothy
I need clarification
what does this mean?
Test drove vehicle after burning out any excess sludge from the oil and coolant mixture and performing a valve cleaning.
there was sludge in the motor after you just replaced the short block ?

*** 07/16/2022 07:02:01 ***

Web - Note created on 07/16/2022 07:02:00 and created by TIMOTHY RODGERS
No when I built it I cleaned out the heads, but I think there was some in the exhaust after the first few start ups. I don't believe there to be anything wrong with this vehicle at this time I was told to make this case

*** Web - Advice created on 07/16/2022 08:15:11 and created by Frank Lusic ***
1: Thank you for the clarification
oil smoke will not dissipate quickly into the air but water vapor will , if you are not sure attach a video

*** 07/20/2022 05:41:13 ***
Web - Note created on 07/20/2022 05:41:13 and created by TIMOTHY RODGERS
I uploaded a video it seems like its vapor it doesn't last very long.

hey best friends, well here i am in another pickle, i think i already know my answer and i really dont like it but ill get your opinion. this sorento came in with a p0018, second visit for same concern, i found the head gasket leaking, i know huge shock. it has an extended warranty so they sent an inspector out and was told to find the cause well of course the head bolts are stripped. the inspector came out again and verified im not atleast 100 percent full of crap. they authorized the short block, heads went to the machine shop, everything finally showed up and away i went, one of the crappiest jobs in kia land. well i got done, ran it to bleed the coolant and to may amazement i found and oil light only when it was hot, cold i got nothing. i replaced the oil pressure switch, the oil filter, checked for anything odd with the filter housing and as a last resort i put in another new oil pump, same issue. im guessing i have too much clearance in the main bearings.

*** 06/13/2022 05:28:32 ***
Web - Diagnostics created on 06/13/2022 05:28:32 and created by TIM CLARK
im praying you have aother idea and no, i cant just unplug the oil pressure switch you big silly. please let me know your thoughts, as much as i dont want to redo this crappy job again i think thats where im at and yes i have done several v sucks with success :)
thanks, tim

1: Use a mechanical gauge to verify low oil pressure and check the upper oil pan (ladder frame) and front of the engine for any missing bolts or oil galley check balls.

*** 06/21/2022 06:49:11 ***
Web - Note created on 06/21/2022 06:49:11 and created by TIM CLARK
installed a hokey gauge and found when its hot its at 5 psi, cold is around 65 psi but i think the spec is 74psi? I didnt see and check balls that needed to be inserted, we reused the old heads and i know for a fact i replaced the green seal from the ladder assy to the block.

*** Web - Advice created on 06/21/2022 07:05:45 and created by Tony Thomas ***
1: 65 psi cold, 5 psi hot sounds line the oil pump is failing. Make sure the oil pump, filter housing, filter and o-rings are intact. If the small o-ring on the filter is missing or damaged on some v6 models oil pressure is lost.

*** 06/21/2022 11:08:15 ***
Web - Note created on 06/21/2022 11:08:15 and created by TIM CLARK
Thought that too, already tried replacing the filter, housing looks ok, no leaks, replaced the oil pump right before i started the case. I have not tried replacing the oil filter housing yet

*** Web - Advice created on 06/21/2022 11:32:08 and created by Tony Thomas ***
1: Does it have the small o-ring?

*** 06/21/2022 14:28:35 ***
Web - Note created on 06/21/2022 14:28:34 and created by TIM CLARK
Yes it does

*** Web - Advice created on 06/21/2022 18:47:05 and created by Tony Thomas ***
1: Seems like the oil pressure may have been a preexisting condition you may have missed before repairs and tear down is necessary to find why oil pressure is low.

*** 06/22/2022 05:41:27 ***
Web - Note created on 06/22/2022 05:41:27 and created by TIM CLARK
oil light wasnt on previous to the repair, if the oil pressure is low at the switch that would be before the heads but after the oil filter housing correct? im not really sure what to look for during tear down apart from platigauging the main bearings. im not trying to be difficult so if i come off that way i apologize im just trying to see where tear down will lead me to

*** Web - Advice created on 06/22/2022 06:09:53 and created by Tony Thomas ***
1: Low oil pressure is a failing oil pump or too much clearance in the main, rod, cam bearing. I would recommend an engine at this point. You can apply light air pressure to the oil passage at the switch with the valve covers and oil pan off to see if you have any obvious excess clearances.

*** 06/22/2022 10:55:45 ***
Web - Note created on 06/22/2022 10:55:45 and created by TIM CLARK
the cam bearings looked ok when i put it together, try the air pressure test and see what that shows, in your personal opinion do you think its worth trying a new oil filter housing? Maybe it could be clogged?

*** Web - Advice created on 06/22/2022 10:58:24 and created by Tony Thomas ***
1: You might want to remove it for inspection. Cavitation can cause low pressure. A restricted oil passage would cause high pressure and restricted flow.

*** 06/30/2022 08:04:45 ***
Web - Note created on 06/30/2022 08:04:45 and created by TIM CLARK
Alright buddy, I pulled the oil filter housing off and inspected it, it seemed ok, I shopped a new one and tried it and same result. I pulled the oil pressure switch out and the oil pump and blew air through it, there wasn't a whole lot of resistance from the sensor to the pump. I think im going to need to replace the short block

*** Web - Advice created on 06/30/2022 08:14:33 and created by Tony Thomas ***
1: With the pan and timing cover removed, you should be able to see where the air is escaping. Since the block only has oil passages to the heads, tensioners, and oil pump/balance shaft, I am not sure what in the block itself could cause no oil pressure unless they left a main bearing out.

*** 07/04/2022 14:30:43 ***
Web - Note created on 07/04/2022 14:30:43 and created by TIM CLARK

my guess is the main bearings arent the correct thickness, its probably not alot maybe a couple of thousanths under spec but enough that when its hot it expands and looses oil pressure, kind of like an old 350 when the mains would spin on those, great pressure when cold but as soon as it get hot goes to zip. ill strip it down and see if i can see or feel anthing from the tensioner, i honestly didnt want to pull the cover if i didnt have to, bad enough i pulled the intake, valve covers, lower pan off. ill let you know what i find, not sure when ill get back to it. are all dealers as backed up as we are? it seems like for every car i finish 3 more pop up, hopefully its just us otherwise i really feel for you guys, i cant imagine what its like

*** Web - Advice created on 07/05/2022 04:21:31 and created by Tony Thomas ***
1: Thanks Tim.

Request Details: no oil pressure.

*** Web - Advice created on 08/04/2022 07:50:18 and created by Tony Thomas ***

1: Based on the information you have provided, you are authorized to replace the engine under parts warranty following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.
2: Please see TSB ENG083 for information relating to all Kia vehicles equipped with Gasoline Direct Injection (GDI) engines and refer to Pitstop PS539 for Engine Component Re-use Guidelines.
3: If the failed engine suffered catastrophic damage (e.g. piston disintegrated, valves broken, rod through the block, seized engine / large particles/metal debris in the oil pan) do not reuse the original intake manifold or oil pump/BSM; replace the intake manifold and the oil pump/BSM with a new one referring to ENG084.

Smell of coolant when engine is hot.

*** 08/05/2022 12:55:37 ***
Web - Diagnostics created on 08/05/2022 12:55:21 and created by Joshua Boyer
Previous visit for coolant smell, performed pressure test and found pressure loss immediately after pressure applied, head gasket failure causing combustion gasses into coolant, verified with combustion gas tester, blue fluid turned green indicating failure. Performed head gasket repair, during repair straight edged block and heads, found heads out of spec, block okay. Customer returned after head gasket and cylinder head repair stating coolant can still be smelt. Inspected engine bay, no signs of coolant leak found, some moisture seen at base of radiator. Had customer drop vehicle off so I could performed a cold pressure test on cooling system. Held pressure at 15psi for 30min, pass. Engine hot performed pressure test and found pressure loss of 2psi in 10min. Removed and installed radiator and performed HOT pressure test, monitored again 2psi drop in 10min time.

*** 08/05/2022 12:55:58 ***
Web - Note created on 08/05/2022 12:55:57 and created by Joshua Boyer
Please advise further test or is the pressure drop normal.

*** 08/08/2022 04:37:05 ***
Web - Note created on 08/08/2022 04:37:05 and created by Joshua Boyer
Good morning, I had vehicle driven over the weekend, 40 miles. I marked the line of the coolant before and noticed after the coolant level dropped about 2in in the reservoir. Performed coolant pressure test, placed cooling system under 15psi of

pressure for 30min and noticed no pressure loss. Allowed vehicle to reach operating temp and performed pressure test again and found when at temp pressure loss is 2psi in roughly 10min. Performed combustion gas leak test, passed fluid in tester strays blue indicating no coolant in combustion chamber. Unable to find any leaks externally. At this point I believe we may have a micro fracture somewhere in the block. Please advise further action.

1: Hello Joshua
The pressure dropping 1 or 2 psi could be normal , depending if the if the engine was warm and then cooled down or the pressure tester leaked a little

2: can you still smell coolant after the radiator was replaced ?

1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in

the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

1: Thank you for the information
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

Case Number: XXXXXXXX Reopen Requested by Britt Dooley.
Reason: [I have removed the cylinder heads and will send them to be checked. none of the head bolts had the threads pulled out but they all were somewhat loose. the deck surfaces appear to be flat enough. i think this engine has been severely overheated as the cylinder walls are discolored. the short block turns quite easily at about 7 lb/ft of rotational torque which may suggest the piston rings have lost tension. will send pictures of cylinder walls. thanks]

Customer states the vehicle over heated.

*** 08/30/2022 13:56:10 ***
Web - Diagnostics created on 08/30/2022 13:56:10 and created by Jacob Elkins
Verified customer concern. Found no dtc stored. Found vehicle to over heat when under load. Found vehicle have to produce heat. Found coolant to smell like exhaust. Found coolant to produce big burst of air pockets when having a coolant tank on top of radiator cap. Expect head gasket to be blown. Reason for starting case is for possible short block replacement as pulling threads out of block is very possible.

*** Web - Advice created on 09/01/2022 12:03:40 and created by Eric Patterson ***
1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please replace the engine under normal warranty procedures.

1: We will need to tear down the engine. Please get dpsm authorization for this inspection. Try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add a video of the head bolts turning past 75 ft/lbs or a picture of the stripped bolts if they will not hold.

1: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

Web - Diagnostics created on 09/13/2022 15:55:15 and created by Joe Albert
Found the radiator fluid low, topped and pressure checked at 12psi found the AT fluid cooler line leaking coolant. Root cause of head gasket issue I believe. Found over 100 PPM HCs using the smog machine to look at the air from the radiator. Tore down engine and attempted to torque down the head bolts and one of the head bolts in the front head pulled threads (B2). Added a picture of the head bolt with the head material stuck to it.. Thanks for your time.

1: Thanks for letting me know what you found. What is the engine oil level and condition, and what is the coolant level? Did the customer have any overheating concerns or did they notice the vehicle overheating? I know you have a failed block test, but please attach the FFD to the case then clear the DTCs and take an all data engine flight recording capturing the start up and a short test drive and attach it to the case. Thanks.

1: In the flight recording I can see about a 2-3º change without the desired position change on the intake and exhaust cams so I suspect there may be play in the timing chain. Please remove the bank 2 valve cover and check for any loose head bolts and for excessive play in the timing chain. let me know what you find and take pictures or videos of any damage and attach them to the case for documentation. Thanks.

1: Hello Jared,
Please perform a block test.

Please let the vehicle cool down a bit and please remove the radiator cap, start the engine and lower the coolant level a bit and run the vehicle until the coolant is visible but low in the radiator. Then perform a Block check as the RPM's are at 1500 and perform the check and see if the color changes on the fluid.

1: Thanks for the info,
- Perform a coolant pressure test, note if system holds pressure or leaks become present.
-How's the oil condition? The coolant level?
- Do the fans actuate on/off
- Also does vehicle over heat?

*** 10/27/2022 13:18:17 ***
Web - Note created on 10/27/2022 13:18:16 and created by Jared Terrell
Vehicle does not over heat
Vehicle fans are working correctly
Coolant level OK
Oil condition is good.

Failed pressure test. Pressure will not hold @ 15psi
Looks like the bottom middle exhaust manifold stud is leaking

Will send picture

*** 10/27/2022 13:18:18 ***

1: Thank you for the information.
Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

1: Mohamed,
Based off your provided information. I am going to generate a PWA case for engine replacement.
Please see if a long block is available and if ones not than make sure to check the cylinder heads for warpage using a machinist straight edge per the procedure listed in the shop manual.

If the cylinder heads are warped than they will also require replacement.
Thank you

2: Note,
The radiator, all coolant hoses, bypass hoses, heater hoses will require replacement.
The reservoir will need to be thoroughly cleaned out.

Any rubber component that came in contact with the oil contamination will need to be replaced.
The heater-core will need to be thoroughly flushed out with liquid detergent & hot water several times OR replaced.
You will need to contact your DPSM for authorization of these additional repairs.
3: The damaged caused by the head gasket leaking is consider collateral damage.
Thank you

*** 10/13/2022 03:21:50 ***
Web - Diagnostics created on 10/13/2022 03:13:04 and created by Robert Preston
MIL on, P0300, P0302, P0304 stored. White smoke from exhaust. Oil level and condition good but coolant is oil contaminated and is over full in bottle. Cylinders 2 and 4 spark plugs wet. Performed cylinder leakdown tests on front cylinders(2,4,6) and found all 3 cylinders leaking pressure to each adjacent cylinder and to the cooling system, causing the coolant reservoir to bubble. Coolant hoses ballooned from pressure.

Suspect loose head bolts/pulled threads in block.

*** 10/13/2022 03:22:04 ***

*** 10/20/2022 03:33:22 ***
Web - Note created on 10/20/2022 03:33:22 and created by Robert Preston
Disassembled engine for inspection. The 4 head bolts around cylinder 4 and 2 bolts between cylinders 3 and 5 all were loose and pulled the threads when removed. Inspected cylinder head flatness and can easily fit a .002" feeler gauge under the straight edge on the gasket surface between cylinders 2 and 4(spec is. 0019"). A .003" feeler will not fit. Bank one head checks ok. There was some coolant intrusion into the oil, but not extreme. The cam journal and the cylinder heads appear ok. The inside of the engine is clean. Vehicle appears to have been serviced at another nearby dealer.

1: Hello Joshua,

Thank you for the information. The mileage and the yr of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If

either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.
3: `

What kind of time am I looking at for teardown? I will have to pull the engine to perform this procedure and I know Kia is not going to pay me to remove the engine and disassemble timing system just to get to the head bolts.

*** Web - Advice created on 10/17/2022 08:43:38 and created by Michael Longbehn ***
1: Hello Joshua,

Techline does not have any information on any labor time. Techline just advise on what is needed by warranty for documentation. IF you have any questions or concern about your labor time and I believe reaching out to your dpsm and or service manager about what techline is requesting should be substantial enough for proper labor diag compensation. Thanks.

*** Web - Advice created on 10/17/2022 08:59:59 and created by Michael Longbehn ***
1: I was advised by upper management that the heads on the engine will need to remove regardless. You will need DPSM approval if the head bolts are damaged.

1: Thank you for the photo and video.

How is the condition of the cylinder head? have you straight edged the bottom of the cylinder head to check for warpage?

*** 10/24/2022 14:13:59 ***
Web - Note created on 10/24/2022 14:13:58 and created by Joshua Castle
head is still in vehicle and attached by upper row of head bolts and still attached to front cover, only one bolt was tight on the bottom row of the head with the amount of coolant it was leaking i would say its fair to assume that some warpage may be present. if a long block can be ordered can long block be used?

*** Web - Advice created on 10/24/2022 16:02:16 and created by Michael Longbehn ***
1: Thanks for the update reviewing case.

*** 10/25/2022 06:31:11 ***

your're welcome, thank you

*** Web - Advice created on 10/25/2022 07:45:20 and created by Michael Longbehn ***
1: Good morning Joshua,

Please obtain approval from the DPSM to inspect and remove the heads. If the Block is needed due to the thread concern, I will approve the engine PWA for you. Thank you.

If the heads are not within specs please seek approval from your DPSM for replacement. If the heads are being replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.
2: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

*** 10/28/2022 05:22:37 ***
Web - Note created on 10/28/2022 05:22:36 and created by Joshua Castle
removed and sent heads out to machine shop to check for warpage. machine shop called later yesterday, the head that was leaking due to the stripped bolts is warped and not within spec. the block is unusable as three fastening points for the rear head have no threads left.

*** Web - Advice created on 10/28/2022 07:42:36 and created by Michael Longbehn ***
1: Thank you for the update, I would advise to replace the long block if available with approval of your DPSM.

1: Matthew,
Based off your provided information. I am going to generate a PWA case for engine replacement.
Please see if a long block is available and if ones not than make sure to check the cylinder heads for warpage using a machinist straight edge per the procedure listed in the shop manual.

If the cylinder heads are warped than they will also require replacement.
Thank you

I have here a 2014 Sorento that has overheated. There are no physical signs of damage or leaks found. I have performed a block test and there are combustion gases getting into the cooling system indicating a blown head gasket. As you may know, on this V6s the head bolts pull the threads off the block in an overheating condition especially one with a blown head gasket. This vehicle appears to still be covered under powertrain.

1: Hello Eric,
Please attach a video with VIN of a block test.
2: Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** 10/19/2022 10:47:03 ***
Web - Note created on 10/19/2022 10:47:02 and created by Eric Lopez
I have attempted numerous times to perform another block test but am unable due to the amount of compression being kicked back through the radiator, it is contaminating the block test fluid with coolant and cannot get an accurate test. I have let the vehicle come to operating temperature and installed an easy fill to the radiator instead to show the consistent bubbling coming back up, indicative of a blown head gasket. I have submitted a video of this including the VIN. Please let me know if you need anything else prior to the tear down procedure.

*** Web - Advice created on 10/19/2022 11:00:27 and created by Martin Lopez ***
1: Eric,
Thanks for the information. I am not seeing the video attached yet. Once it is I will review it.

1: Reviewing case and attachments.

*** Web - Advice created on 11/01/2022 13:49:58 and created by Jeffrey Minderhoud ***
1: Thank you for the video showing the threads for the head bolts are stripped and the valve train is clean with no sludge.
2: Please obtain approval from the DPSM to inspect and remove the heads. We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short

block. Thanks

Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

I DID NOT SEE ANY EVIDENCE ON THE HEAD GASKET, I DID REMOVE THE CAT CONVERTER AND ITS ONLY WET UNDER THE EXHAUST MANIFOLD GASKET, NOTHING INSIDE ANY EXHAUST PORT NOR HEAD GASKET. I DID A PRESSURE TEST AND NO VISIBLE LEAK, MIGHT ONLY HAPPEN WHEN VEHICLE IS HOT. I WILL ATTACH PHOTOS.

*** Web - Advice created on 09/02/2022 09:30:04 and created by Greg Phillips ***
1: Do you see any cracks or holes above the manifold or at the bolt holes? I know it's kind of tough to see in the car. I think we are going to need to remove this head for close inspection. During that process, see if any of the head bolts are loose and if there are any signs of overheating. If any of the bolts are loose, stop and see if there is block thread on the loose bolt(s).

1: Did the blown hose cause an overheat? Is there exhaust gases getting into the coolant? Yes, I would check the head bolts on this And check maintenance. Make sure the fan is working as well.

*** 10/28/2022 10:34:05 ***
Web - Note created on 10/28/2022 10:34:05 and created by Salvador Orozco
I BELIVE THATS WHY IT WOULD OVER HEAT. I HAVENT NOTICED EXHAUST GASES YET BUT I DO SEE COOLANT SEEPAGE ON FRONT SIDE OF ENGINE CYLINDER HEAD. I DONT SEE ANY HISTORY AT THIS DEALERSHIP FOR THIS VEHICLE.

*** Web - Advice created on 10/28/2022 12:37:05 and created by Greg Phillips ***
1: I'm just wondering what came first. Compression into the cooling system and then the blown hose, or overheat from the blown hose that caused the head gasket to fail. In either case, if it doesn't look like it was the result of somebody working on it and not putting it together correctly, and isn't the result of the fans not working or the radiator being blocked or damaged, and maintenance has been reasonable, I would go ahead and check to see if the head bolts have pulled threads from the block.

*** 11/04/2022 09:33:31 ***

1: Charles, please fill the cooling system and pressure test with engine cold to confirm the source of the leakage that is causing the build up of corrosion on the exhaust studs.
Inspect front and rear of engine and record a video showing the leak confirmed.
2: If this is leaking from head gasket, then note this or the source you confirmed to be leaking. Have shop foreman assist you in identifying the leak if needed.

*** 11/09/2022 05:04:53 ***
Web - Note created on 11/09/2022 05:04:53 and created by Charles Sydor

pressure test and found pressure drops, found smoke coming out exhaust pipe. Disconnected. Front pipe and found coolant on oxygen sensor. Leak does not appear to be external at head gasket

*** 11/09/2022 05:04:55 ***
166799886951278058514672513950 92.jpg added by Charles Sydor on 11/09/2022 05:04:54

*** Web - Advice created on 11/09/2022 07:53:50 and created by John Rehm ***
1: Charles,
I do not see any leakage in either of your images. The corrosion on exhaust stud signs a leak, but will need to be identified to confirm the source of leakage. This is above the head gasket so another leak maybe running down to that point.
--Please fill the cooling system and pressure test with engine cold to confirm the source of the leakage that is causing the build up of corrosion on the exhaust studs.
2: Have shop foreman assist you in identifying the leak if needed.
3: ---If this is leaking internally through head gasket, then you will need to show a block leak test failing in a video including the VIN and the test starting with new fluid and changing in the video clearly.
---OR you can record a video showing the leak down testing being performed on the cylinder with leakage into the cooling system from combustion chamber.
--Please add a video showing the leak down test being performed, the % of leakage and where the air is escaping to clearly. Please use smoke or a piece of plastic or something to show the air leakage. Intake (T/B) exhaust (remove B1S1 and show the air escaping), Cooling system (please show the bubbles, coolant level full), or the oil cap (show the leakage with a thin piece of plastic or smoke)
---Either video is fine, but we do not need both, just whatever confirms your statements. If unconfirmed about internal leakage then continue pressure testing cold as I have requested and note the leakage confirmed. Show this in a video attached to the case.

*** 11/09/2022 07:58:31 ***

*** Web - Advice created on 11/08/2022 13:56:50 and created by Jerry Gossling ***
1: Based off your provided information. I am going to generate a PWA case for engine replacement.
Please see if a long block is available and if ones not than make sure to check the cylinder heads for warpage using a machinist straight edge per the procedure listed in the shop manual.

If the cylinder heads are warped than they will also require replacement.
Thank you

*** 11/08/2022 13:57:09 ***
PWA Case created for RA Case 15117221 by Jerry Gossling

*** 11/08/2022 13:57:09 ***
Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

*** 11/09/2022 13:07:31 ***
Web - Diagnostics created on 11/09/2022 12:56:51 and created by Todd Butcher
THERE IS A CONSIDERABLE AMOUNT OF ENGINE OIL LEAKING, VISUAL INSPECTION FOUND THE CYLINDER HEAD GASKETS ARE LEAKING OIL IT IS RUNNING ALONG THE CYLINDER DECK THEN RUNNING DOWN THE BACK SIDE OF THE ENGINE BLOCK CAUSING OIL TO PUDDLE WHERE THE ENGINE BLOCK IS MOUNTED TO THE TRANSMISSION BELL HOUSING.
WE ARE A "A" DEALER AND I WOULD JUST REPLACE THE CYLINDER HEAD GASKETS UNDER POWERTRAIN BUT S/M WANTED ME TO START A T/L CASE TO GET YOUR OPPINION.
I'M IN THE PROCESS OF REMOVING THE INTAKE MANIFOLD TO GET SOME GOOD PICTURES, WILL ATTACH ASAP.
THANK YOU.

Dear WHITNEY

Your dealer has made us aware of the current repair situation for your Kia vehicle. Your satisfaction is important to us and we would like to provide assistance should you have any outstanding concerns or issues that were not resolved by your dealership. If you would like further assistance, please respond to this email with your preferred method of contact (phone or email) and we will be happy to follow up with you regarding the matter.

If no further assistance is required, there is no action necessary on your part. We value you as a customer so please don't hesitate to reach out to us should you require assistance in the future.

Sincerely,
Kia Customer Care

customer states car loses heat and overheats even on short drives.

*** 11/17/2022 07:57:59 ***
Web - Diagnostics created on 11/17/2022 07:41:39 and created by Daryll Marotte
tech verified loss of heat and overheating. tech checked cooling system and found cooling system bubbles with cap off and vehicle running. tech performed hydrocarbon leak test . test turned yellow very quickly indicating hydrocarbons in the cooling system. due to previous experience with this issue tech removed valve cover and moved cam enough to gain access to head bolts to perform torque test. top right head bolt on front bank would not torque past 15ft.lbs and kept spinning until i was able to remove it with all the block threads stuck in the head bolt.
i have attached pictures on hydrocarbon test and bolt with block threads stuck in it. please advise.

Web - Problem Description created on 11/25/2022 11:15:52 and created by Dylan Ibrahim
Customer states engine is overheating and burning coolant. Excessive white smoke coming from tail pipe.

*** 11/30/2022 11:17:00 ***
Web - Diagnostics created on 11/25/2022 11:15:52 and created by Dylan Ibrahim
Verified that engine is, in fact, overheating. Found coolant reservoir empty. Checked cylinder head gasket visual and can see dried up coolant head meets block. Performed tear down of engine. Checked head bolts for stripped threads in the block. Found two stripped head bolts on bank 1 side that can no longer be tightened down. Recommending short block replacement. I uploaded a video showing the stripped bolts.

Customer states vehicle doesn't blow heat at all. Coolant will gurgle and go out of the overflow.

*** 11/30/2022 12:58:09 ***
Web - Diagnostics created on 11/30/2022 12:49:33 and created by David Nelson
Inspected the vehicle and scanned for codes and there are no codes. I checked the radiator and the coolant and found as soon as the engine starts running the cooling system fills with pressure. I used a block tester and performed a block test and found there is combustion gases building up in the cooling system. As the vehicle starts to get warmer the tail pipe begine to emit white smoke from coolant. I am adding pics and video.

C/s broke down on interstate, overheating

*** 12/02/2022 09:13:32 ***
Web - Diagnostics created on 12/02/2022 09:08:27 and created by Thomas Rodenish
Scanned no codes, found no coolant in system, filled and pressure tested to 17psi. Small bleed off found after a half hour but no leaks under vehicle or inside cabin. Performed combustion leak test and found coolant to turn green. (Possible contamination) engine radiator warped due to extreme heat damage, over flow line blew off, rad cap spout warped to the point you can not get the cap, pressure tester or fill funnel on with out adding a second gasket. White residue coating inside if radiator and when started smoke bubbles out smelling of exhaust fumes. Also when starting knocking can be heard coming from engine. Idles rough and poor power. Drained oil for inspection and found no weird abnormalities.

1: Thank you for the information and attachments. We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

If unable to torque the head bolts because they are striped. Please remove stripped bolts and attach photos showing block aluminum treads on the bolt(s), then I will approve a PWA case for the short block replacement, thank you.

As you can see in the pictures and videos iv attached head studs indeed stripped out. One was just loose making a total of 4 breach points. Would like feed back soon I apologize for the reopen as I'm pretty booked up as well as being sick, just now getting back to my bigger jobs.

*** Web - Advice created on 12/28/2022 07:10:28 and created by Juan Vazquez ***
1: Thank you for the video attachment. The video you have sent in is acceptable showing the cylinder block treads have come out and engine needs replacement.

I have generated and approved a PWA case for you.
Based on the information you have provided; you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA (buckets) if applicable, so the valve clearance can be adjusted properly.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083. Thank you.

1: Hello Brandon,

Please add pictures of the leaks from the engine head gasket.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Hello Brandon,

Did you happen to find any damages head bolts? Such as the threads coming off the cylinder block? Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Upload a photo of your findings. Thanks.

C/S THE CEL IS ON AND SOLID. C/S THE ENGINE IS MAKING A CHIRPPING NOISE.

*** 12/19/2022 08:05:27 ***
Web - Diagnostics created on 12/19/2022 08:00:49 and created by Chris Kohler
VERIFIED THE CEL WAS ON WITH THE DTC P0116- ENGINE COOLANT TEMP CICUIT RANGE/PERFORMANCE. WHEN DRIVING THE VEHICLE INTO THE SHOP I COULD HEAR THE NOISE THE CUSTOMER STATED. INSPECTED THE ENGINE AREA OF THE NOISE TO FIND EXHAUST ESCAPPING FORM BETWEEN THE LH HEAD AND SHORTBLOCK. ITS BLOWING OIL AND COOLANT OUT ONTO THE TANSMISSION. I PERFORMED THE BLOCK LEAK TEST, THE BLUE CHEMICAL TURNED GREEN INDICATING EXHAUST COMING THROUGH THE COOLANT SYSTEM. I ADDED TWO GALLONS OF WATER INTO THE SYSTEM, LET THE ENGINE RUN FOR ABOUT 5 MINUTES, I FOUND OIL MIXING INTO THE COOLANT AND EXHAUST PUSHING THROUGH THE RADIATOR AND COOLANT RESERVOIR. THE COOLANT LOOKS LIKE CHOCOLATE MILK NOW. I ACN NOT PERFORM A COMPRESSION AND LEAK DOWN TEST DUE TO THE DAMAGE OF THE BLOWN HEAD GASKET. FROM PAST EXPERIENCE UNDER CUSTOMER PAY, I HAVE REPLACED ENGINES DUE TO HEAD BOLTS STRIPPING THE THREADS IN THE BLOCK. THE CUSTOMER HAS RECORDS OF SERVICE FROM PEAK KIA OF LITTLETON COLORADO AND FIRESTONE. PLEASE ADVISE.

1: Thank you.
Based on this information, the cylinder head or heads will need to be removed for inspection, but first; There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

Web - Problem Description created on 11/25/2022 13:21:04 and created by Brian Adams
Hey i have this 2015 Sorento V6. Customer came in with a concern of the vehicle having an engine light, confirmed the engine light is on. Found fault code P0018. Oil level is on F. Noticed there was oil in the coolant reservoir and removed the radiator cap and noticed there was oil in it too. Confirmed there was an oil filter(aftermarket) but the nipple was placed correctly. Performed actuation test on all 4 OCVs and confirmed it was operating normal. Any advice to this situation? thank You!

1: Thanks,
Based on this information, the cylinder head or heads will need to be removed for inspection,
BUT FIRST;

There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

Web - Problem Description created on 01/12/2023 07:10:30 and created by Kyle Windbiger
Opening this case at the request of warranty clerk so there would be a record of this. Customer complaint is the vehicle is overheating. I found that there was oil in the coolant reservoir. Customer gave permission to teardown engine and find root cause of failure. Found both head bolts between cylinders 4 and 6 were stripped in the cylinder block. I have sent video and a picture of the head bolts.

1: I have generated a PWA case for you. Based on the information you have provided, I recommend that you replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please replace the engine under normal warranty procedures.

*** Web - Advice created on 01/12/2023 16:58:30 and created by Eric Patterson ***
1: If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need replaced please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

Web - Diagnostics created on 01/13/2023 12:38:19 and created by Christopher McKenney
Verified complaints, checked coolant level, radiator empty. Added coolant to top-off level, verified overheating. Visually inspected engine and engine bay for visible coolant leaks, found oil and coolant leaking from back of engine at head gasket area of cylinder #5. Removed bank 1 valve cover, checked torque of head bolts, found head bolt between cylinders #3 and #5 under exhaust cam stripped and not holding torque. Performed leak-down test of bank 1 cylinders, found combustion leaks into cooling system in cylinders #3 and #5. Video attached.

Coolant and oil leaking at fornt of engine. Cylinder 6 is misfiring.

*** 01/17/2023 08:24:39 ***
Web - Diagnostics created on 01/17/2023 08:14:29 and created by Don Verville
Scan for codes. P0306. Found oil and coolant leaking down the front of the engine. Bore scope cylinder with cooling system under pressure. System will not build pressure. large amounts of air flowing from spark plug tube. Bore scope showed and oily sludge running down cylinder #6. Please review photo below. Video capture shows misfire as well as noise from engine. noise is believed to be combustion pressure leaving the front of the engine between the cylinder head and block. Please review videos. Available maintenance records show most service performed a swift lube, including a recent coolant service at around 90k. Oil is full, coolant is half way down the radiator and still mostly green.

1: Good morning Don,

Thanks for the InfoMation and video. I will need the following before we can proceed. Please upload a video of the odometer mileage, VIN and of you performing a block check and of the fluid color after the color change please. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.

*** 01/18/2023 11:33:00 ***

Michael, I lifter the front cam of bank two just engough to get to the head bolts. Attempt to retorque the corner head bolt failed. I was able to remove the bolt with thread still on the bolt. Please review the attached photo. I also attempted to retoque all of the front bolts on bank two. None of them would get past 35ft lbs. All of them began to spin freely following retorque attempt. No metal showing the the Exhaust OCV of bank 2.

1: Thank you, reviewing case.

*** Web - Advice created on 01/18/2023 15:34:53 and created by Jeffrey Minderhoud ***
1: Thank you for the video showing the threads are stripped for the head bolts. I will authorize the pwa for you now.

Please obtain approval from the DPSM to inspect and remove the heads. We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

Please strait edge the heads. If they do need to be replaced, please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleries as well.

1: Hello Joseph,

Thank you for the information. The mileage and the year of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a

few things.

Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Thank you.
Based on this information, the cylinder head or heads will need to be removed for inspection,
BUT FIRST;
There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin PWA cases

*** Web - Advice created on 01/28/2023 06:53:04 and created by Juan Vazquez ***
1: Thank you for the information and attachment. We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

If unable to torque the head bolts because they are striped. Please remove stripped bolts and attach photos showing block aluminum treads on the bolt(s), then I will approve a PWA case for the short block replacement, thank you.

*** 01/31/2023 08:37:18 ***
Web - Note created on 01/31/2023 08:37:18 and created by Daniel Manibusan
Was going to bring vehicle into shop for tear down but now engine is seized.

*** Web - Advice created on 01/31/2023 08:49:46 and created by Juan Vazquez ***
1: Daniel, when did this engine seized? It was running when the video was taken.

Please remove engine oil dip stick and attach an uninterrupted video showing vehicle, VIN tag, Odometer, oil level on the dipstick, spark plugs removed, empty spark plug holes on the engine, drive belt removed, socket on the crank bolt and technician trying to rotate crankshaft with a torque wrench set to 94 ft. lbs.

Please verify the video shows clear torque wrench setting. If this engine is not seized, I need to see at what torque the engine begins to rotate, thank you.

*** 02/01/2023 08:55:20 ***
Web - Note created on 02/01/2023 08:55:20 and created by Daniel Manibusan
Yes it was running before when I opened the techline case. Was able to bring the car to the stall and park it later. After your response to the case I was going to bring the car in for teardown but it would not start. Tried to manually turn over by hand with torque wrench set to 94 ft. Lbs and could not. Wrench clicked, engine seized. This is a 6 cylinder engine, did you still need me to pull all of the plugs? If so I would have to remove intake manifold.

*** Web - Advice created on 02/01/2023 08:59:15 and created by Juan Vazquez ***
1: No need to remove the spark plugs, just be sure to show torque wrench setting.

*** 02/02/2023 09:15:50 ***

Customer states that the vehicle is overheating and had to add coolant to get to dealer multiple time please check and advise. I verify the concern the vehicle overheat and push out the coolant thru the overflow bottle the hose have alot of pressure in them no check engine light came on and no history codes related.

*** 02/02/2023 13:49:00 ***
Web - Diagnostics created on 02/02/2023 13:44:35 and created by oshane nichol
Scan all systems and link the VDN # I did not find any related codes, after test drive I lift the car to inspect and found the rear head gasket leaking green coolant between the cylinder block and head I attach a picture. I perform a combustion leak test using a oem block tester and the vehicle fail I attach a picture of test which indicates exhaust gas in coolant system causing excessive pressure.

1: Hello Oshane,

Thank you for the information. The mileage and the year of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 02/04/2023 07:18:49 ***

1: The warranty has been validated
2: Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

1: We will need to tear down the engine. Please get dpsm authorization for this inspection. Try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Record a short video of the attempt to torque the bolts or the stripped threads. Make sure to show the valve train condition so we can see if there is any sludge present and get the vin on the vehicle in the video and attach to the case. Thank you.

1: Thank you for the video showing the head bolt threads have failed.

Please obtain approval from the DPSM to inspect and remove the heads. We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

Please strait edge the heads. If they do need to be replaced, please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleries as well.

Web - Diagnostics created on 02/21/2023 12:37:52 and created by Jonathan Taylor
Inspected coolant level and found coolant reservoir below low markings. performed coolant system pressure test and found slight loss of pressure. inspected coolant components and engine oil. found oil/coolant mixture. found Bank 2 cylinder 6 area corner of the head to appear to be leaking oil. Using borescope inspected inspected all 6 cylinder while system pressurized and found no coolant leaking in to cylinders.

*** Web - Advice created on 02/22/2023 07:51:23 and created by Frank Lusic ***
1: Hello Jonathan
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 02/23/2023 14:47:32 ***
Web - Note created on 02/23/2023 14:47:32 and created by Jonathan Taylor

Loosened and re torqued head bolt. found bank 2 cylinder 6 exhaust side head bolt loose by a full turn. felt rough trying to back out but did torque down.

*** Web - Advice created on 02/23/2023 14:56:40 and created by Frank Lusic ***
1: Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines. Please refer to Pitstop PS302 for the proper shipping procedures for
the return

1: Reviewing case.

*** Web - Advice created on 01/31/2023 13:05:33 and created by Jeffrey Minderhoud ***
1: Then please perform a block check and add a short video of the fluid changing color while performing the test. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.

*** Web - Advice created on 01/31/2023 13:12:07 and created by Jeffrey Minderhoud ***
1: We will need the Customers oil change maintenance receipts. Please also run a Carfax report and to see if the Customer

has any other maintenance receipts on the report if the Customer cannot locate all of them. Then at that point, please get all the (LOF only receipts) Then attach the receipts in chronological order for review. Advise what LOF's are missing. Scanning them in is recommended.

1: Reviewing

*** Web - Advice created on 02/27/2023 13:56:33 and created by Jeffrey Minderhoud ***
1: Thank you for the pictures showing the valve train has no sludge and the threads are damaged for the head bolts.
2: Please obtain approval from the DPSM to inspect and remove the heads. We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

If the heads are not warped I would recommend sending them out for pressure checking and a valve job. If they are warped I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

Please strait edge the heads. If they do need to be replaced, please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleries as well.

1: Hello Jarel,

Thanks for the info.
Please attach photos of the leaks you found around the cylinder heads.

Then,
Based on this information, the cylinder head or heads will need to be removed for inspection,
---BUT FIRST;----

There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

1: Thank you for the information the head gaskets are most likely the cause of the problem, let's check the torque on the head bolts near the leak. Remove the valve cover and see if any of the bolts are loose near the leak area. Add a video if so. Thank you

*** Web - Advice created on 03/09/2023 09:17:43 and created by Eric Patterson ***

1: : We will need to tear down the engine. Please try and torque down the engine head bolts to 55 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.
2: Let me know if the Maintenance does not look OK first Thank you

Web - Problem Description created on 03/09/2023 12:13:12 and created by tyler negethon
ok so customer came in with this one and was concerned about the car over heating and loosing heat from heater. so i brought the vehicle in and when i popped the hood i saw the over flow reservoir bubbling i checked the temp of radiator and the hoses and they were luke warm but i could feel the hoses were heavily pressurized so i grabbed a couple rags and released the pressure. once i got the cap off i could see carbon smoke hovering in the radiator. so then i raised the vehicle and inspected the heads from underneath and saw there was sludge coating the entire mating point and a path from coolant leaking out. down the block and subframe indicating the bank on the firewall side has pulled the threads on the head bolts and the vehicle needs an engine. if u need further diag i am willing to dig deeper but from what i see its obvious the head gasket isn't sealed and causing the over heating.

scanned for codes and has P0306 active, P0300 and P0304 history. upon start up engine runs rough. inspected engine bay and found the coolant reservoir very full. removed cap and coolant smells like exhaust gases. inspected the head gaskets and found bank 1 cylinders 4 and 6 has a heavy leak. bank 2 cylinders 4 and 6 is leaking as well and coolant on the starter shield. started engine and let idle until hot and temp is going over 230 degrees and tailpipe smells like coolant. inspected oil and doesn't have coolant mixed in yet. i've done several of these where the head bolts get stripped and causes this issue. i need approval for short block assy thanks.

1: Hello Souta,

Thank you for the information. The mileage and the year of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Thanks.
Based on this information, the cylinder head or heads will need to be removed for inspection,

---BUT FIRST;----

There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** 03/15/2023 14:16:37 ***
Web - Note created on 03/15/2023 14:16:36 and created by jonathan melesio
removed the cam shaft and was able to remove head bolt with a quarter inch ratchet, removed the bolt and the thread where on the bolt (stripped).

<For Internal Use Only
Bolts stripped in block>

*** Web - Advice created on 03/22/2023 11:45:04 and created by John Rehm ***
1: If the heads are not warped, I would recommend sending them out for pressure checking replace seals and check the guides. If they are warped, I would recommend a long block be used if available. If there is no long block available, the heads will need to be replaced and the valvetrain components swapped over. Please make sure the new camshafts are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly.
Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need to be replaced, please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

2: I have generated and approved a PWA case for you.

1: Good morning Gerardo,

Please upload photos of the leakage to the case.

Then please perform a block check and add a short video or a clear picture of the fluid color after the color change please. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.

1: Hello Gerardo,

Thank you for the information. The mileage and the year of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Hello Alex
Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 01/25/2023 07:08:36 ***
Web - Note created on 01/25/2023 07:08:35 and created by Alex Fleming
I will do that. I got customers permission for tear down. I will update you again once i get this vehicle back in and torn down.

1: Hello Luis,

Thank you for the information. The mileage and the year of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts

if they will not hold, then I will approve the PWA case for the short block replacement.

1: Hello Luis,

After further review with the engineer team they are requesting a video you torquing the cylinder head bolts to 75ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

OCV shows not enough evidence to condemned the engine. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

Vehicle is misfiring and white smoke is coming out of the exhaust at idle. Smells like burnt coolant.

*** 04/10/2023 13:59:31 ***
Web - Diagnostics created on 04/10/2023 13:55:46 and created by Colby Bancroft
Scanned codes. Found active codes for P0300 and P0303. History codes for P0131 and P0301. Visually inspected cylinder block and found burnt coolant residue build up and white smoke that smells like coolant coming out of the exhaust. Vehicle symptoms point to a head bolt that pulled the threads causing a loss of torque on the head gasket allowing coolant to leak into the cylinder and out of the head.

*** Web - Advice created on 04/14/2023 13:46:35 and created by Frank Lusic ***
1: Hello Santiago

Based on this information the cylinder head or heads will need to be removed for inspection but first There have been cases where the treads in the block that are for the head bolts strip out, Once the cams are removed loosen all of the head bolts to see if there are any that are looser than the rest of the bolts. If this is the case then try to re torque those bolts to see if the threads in the block will hold, If they do not then the block will need to be replaced the cylinder heads too if warped beyond specifications Please report your findings

*** 04/20/2023 12:29:01 ***
Web - Note created on 04/20/2023 12:29:01 and created by Santiago Marban
upon tear down found rear cylinder head bolts near cylinder 1 and 3 not torquing after 30flt lbs + 120 + 90 just kept spinning. used straight edge to measure specification of cylinder head, specification not in spec 0.07mm

*** Web - Advice created on 04/20/2023 12:59:36 and created by Tony Thomas ***
1: Attach a short video of the head bolts pulling threads from the block.

*** Service Alert Escalated to CA as: 15472451 on 04/21/2023 01:04:41 (PST)

*** 04/21/2023 06:07:08 ***

*** Web - Advice created on 04/13/2023 15:34:08 and created by Michael Longbehn ***
1: Hello Ernesto,

Reviewing case notes.

*** Web - Advice created on 04/13/2023 15:35:17 and created by Michael Longbehn ***
1: please perform a block check and add a short video or a clear picture of the fluid color after the color change please. You may have to lower the cooling system a bit, then warm the engine up until the thermostat opens and the coolant is flowing. Then keep the RPM's at 2000 rpm while continuing to suck with the plunger on the block tester. If the coolant isn't flowing then the gas cant get up to the neck.

*** 04/14/2023 06:47:06 ***
Web - Note created on 04/14/2023 06:47:06 and created by Ernesto Chavez Villa

could not perform test due to coolant coming out of radiator cap if engine passes the 1300 rpms. try to perform test at idle but test comes out inconclusive.

*** Web - Advice created on 04/14/2023 08:22:11 and created by Michael Longbehn ***
1: Thank you for the information. The mileage and the year of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 04/17/2023 06:51:08 ***
Web - Note created on 04/17/2023 06:51:08 and created by Ernesto Chavez Villa
Upon farther inspection found one of the head bolts has pull the tread out of the block, see attachments.

*** Web - Advice created on 04/08/2023 21:23:14 and created by Greg Phillips ***
1: Is there coolant in the cylinders? Are you sure it's the exhaust manifold and not the head gasket? It's hard to tell from the angle of the photo.

*** 04/10/2023 09:49:19 ***
Web - Note created on 04/10/2023 09:49:19 and created by Ernesto Chavez Villa

there is not actual coolant in cylinders. there are water spots on top of pistons, i also pressure testes the coolant system and did not see coolant in cylinders. coolant is leaking into cylinders 2, 4, 6 and leaking out of the exhaust manifold. this is only happening when vehicle is running and hot. possible head gasket or head bolt have retracted i don't know unit removal of head and inspect for the source of leakage.

*** Web - Advice created on 04/10/2023 13:33:17 and created by Greg Phillips ***
1: I'm thinking that if it's coming from the exhaust manifold, you have to also have an exhaust leak. And if you have that much leaking out of the exhaust manifold, there has to be a lot more going through the exhaust. I would see if there is coolant in the oil, and I would move on to checking the head bolts or removing the head for further inspection. If you find head bolts loose, check for block thread on the head bolts. If there is any, stop and get a photo of that head bolt. Get DPSM authorization for the tear down if needed.

*** 04/14/2023 13:15:47 ***

Allow Auto PWA Case checked on 5/3/2023 11:16:57 and checked by Joseph Gonzalez

*** Web - Advice created on 05/03/2023 11:17:09 and created by Joseph Gonzalez ***
1: Thank you for the video. A long block replacement would be best for this concern.
2: Please use the Create PWA Case tab that I have enabled and provide all the required information for final review, however, the engine diagnosis portion needs to be completed (only available in a PWA case). I would recommend proceeding with opening PWA cases when you are requesting engine replacement. It looks as if you have all the information to approve a case Thank you.

----------Please read below----------

If you are experiencing problems, Please fill out the Engine Diagnosis section on this case, then add a note to the case after updating the fields. If there are any PWA draft cases (for any Vins), please erase them. I just need the Engine diagnostics tab filled out. Then I can create the PWA case. Thank you.

*** 05/05/2023 08:28:05 ***
I have generated and approved a PWA case for you.

cylinder #4- 140psi
cylinder #6- 150psi

*** Web - Advice created on 04/24/2023 08:12:59 and created by Joseph Gonzalez ***
1: Thank you for the information. Please attach photos of the oil leaks, you would need to correct the leaks and start a oil consumption test afterwards to see if in fact the engine is consuming oil or if it just leaking out excessively.

Allow Auto PWA Case checked on 5/11/2023 9:34:30 and checked by Joseph Gonzalez

*** Web - Advice created on 05/11/2023 09:34:31 and created by Joseph Gonzalez ***
1: Thank you for the information. Based on the information you provided, a short block would be needed to address this concern.
2: Please use the Create PWA Case tab that I have enabled and provide all the required information for final review, however, the engine diagnosis portion needs to be completed (only available in a PWA case). I would recommend proceeding with opening PWA cases when you are requesting engine replacement. It looks as if you have all the information to approve a case Thank you.

----------Please read below----------

If you are experiencing problems, Please fill out the Engine Diagnosis section on this case, then add a note to the case after updating the fields. If there are any PWA draft cases (for any Vins), please erase them. I just need the Engine diagnostics tab filled out. Then I can create the PWA case. Thank you.

*** 05/11/2023 09:58:43 ***
I have generated and approved a PWA case for you.

*** 05/11/2023 10:02:48 ***

1: This looks like it's coming from the head gasket. If it's a light amount of coolant I would proceed with removal of the head to replace the head gasket and check cylinder walls, deck flatness, head flatness, etc. Stop if you find head bolts with stripped block threads on them and add a clear photo.

1: Thank you for the information provided. I agree with you, if there is an oil consumption issue, it does not make sense to go into the engine twice.
- Please verify that PCV is operating properly and no external leaks.
- Attach a copy of current repair order, front and back, need to see technician handwritten notes documenting findings, including oil level.
- Remove engine oil dipstick and attach a clear photo showing current oil level.
- Remove all the spark plugs and attach a clear image of all the spark plugs, place them in cylinder order, need to see electrode and porcelain exposed to the combustion chamber, looking for any carbon, oil or soot build up.

- Also need maintenance documentation. Only show one oil change from 48,356 to 77,395 miles.
- Ask the customer to provide this documentation. If not available, run a Carfax and attach to this case.

*** Web - Advice created on 03/08/2023 14:43:13 and created by Juan Vazquez ***
1: Jose, one more thing. Please inspect the cylinder head gasket perimeter. Looking at it from the bottom, see if there is any evidence of oil leaking.
If you find evidence of oil leak coming from the head gasket, attach clear images and hold off on removing the spark lugs for now.

1: Thank you for the information and attachment. You have established proper maintenance. Now we need to document excessive oil consumption. Please continue with previous instructions to provide the following:
- Please verify that PCV is operating properly and no external leaks.
- Attach a copy of current repair order, front and back, need to see technician handwritten notes documenting findings, including oil level.
- Remove engine oil dipstick and attach a clear photo showing current oil level.
- Inspect head gaskets for any indication of oil leak, if you find traces of oil coming out of the head gasket attach clear images. (inspecting head gaskets from under vehicle works better)
- If head gaskets do not Remove all the spark plugs and attach a clear image of all the spark plugs, place them in cylinder order, need to see electrode and porcelain exposed to the combustion chamber, looking for any carbon, oil or soot build up.

1: Thank you for the information and attachments. We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket.

If unable to torque the head bolts because they are striped. Please remove stripped bolts and attach photos showing block aluminum treads on the bolt(s), then I will approve a PWA case for the short block replacement, thank you.

1: I called Devin to discuss the case and he confirmed 3 of the head bolts were loose.

Based off your provided information. I am going to generate a PWA case for engine replacement.
Please see if a long block is available and if ones not than make sure to check the cylinder heads for warpage using a machinist straight edge per the procedure listed in the shop manual.

If the cylinder heads are warped than they will also require replacement.
Thank you.

<For Internal Use Only
One gap in service history, but radiator had been replaced for overheating back at 25k per history.>

*** Web - Advice created on 05/23/2023 11:07:02 and created by Adam Kazarian ***
1: Thank you for the reply David,

I wanted to make sure service was in order, CP history does help fill the gaps.

At this point we need to see which head has the blown head gasket remove the cylinder head and check the block and head for warping, cracks, or damage. If the cylinders are completely full of coolant and you think it is likely that they may have bent a rod or caused bottom end damage or there is other bottom end damage please advise. If the head is warped and the block is not the head needs to be replaced.

Customer states vehicle overheating/coolant leak.

*** 05/18/2023 09:16:13 ***
Web - Diagnostics created on 05/18/2023 09:06:26 and created by Glen Porter
Verified customer concern, coolant overflow tank is over filled. Coolant level in the radiator is low. When engine is running both upper and lower radiator hoses become rock hard. Relieved cooling system pressure and started vehicle with the radiator cap off. With the engine running bubbles are present in the cooling system. Suspected head gasket/head bolt issue. Gained access to the head bolts to verify they are not stripped or loose. Found loose head bolt on bank 2. Video is attached showing mileage/VIN and the loose head bolt.

1: Hello Gregory,

There have been similar cases of this condition.
But first need some documentation.

- Provide pictures of the leaks found around the cylinder heads.

- Please also perform a block test and note if the fluid changes color.

Thank you.

1: Thanks.

Kind of looks like the water outlet could be also leaking.

Perform a coolant pressure test just to rule out that possibility and check for leaks and source.

Thank you.

1: Thanks.

Based on this information, the cylinder head or heads will need to be removed for inspection,
>>>BUT FIRST;<<<<
There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

1: There are some gaps larger than 7,500 miles apart in the oil change history. We will need the Customers oil change maintenance receipts. Please also run a Carfax report and to see if the Customer has any other maintenance receipts on the report if the Customer cannot locate all of them. Then at that point, please get all the (LOF only receipts) Then attach the receipts in chronological order for review. Advise what LOF's are missing. Scanning them in is recommended.

If the customer can not provide any additional oil change records please get customer authorization and remove the valve cover to record a short video of the valve train condition and the under side of the valve cover, make sure to include the VIN on the vehicle in the video and attach the file to this case. Thank you.
2: One valve cover is enough since its v6 if we go that route. Thank you.

1: Thank you. I see the valve train is clean with no sludge.
2: We will need to tear down the engine. Please get dpsm authorization for this inspection. Try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Record a short video of the attempt to torque the bolts or the stripped threads. Make sure to show the valve train condition so we can see if there is any sludge present and get the vin on the vehicle in the video and attach to the case. Thank you.

1: Thank you for the information. The mileage and the year of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the OCV'S. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

*** 06/26/2023 10:17:45 ***

customer states after driving veh home from purchase, cluster displayed an overheating code and began to rise in coolant temp.

*** 06/30/2023 14:24:43 ***
Web - Diagnostics created on 06/30/2023 14:16:15 and created by ANDREW SIMMONS
was able to duplicate concern of veh overheating. let engine idle in stall for approx 30min before air was seen bubbling in the coolant reservoir and veh started to overheat. initially tried bleeding system but noted the a/c (settings set on max heat) was blowing cold at all times and air was visually seen causing bubbles in the coolant reservoir. performed leak down test and confirmed head gasket failure- with regulated pressure, air was heard coming from the coolant tank reservoir. searched history cases and found previous case indicating the same type of failures. customer at that time traded out of veh so diagnosis was cut short.

*** Web - Advice created on 07/01/2023 08:27:55 and created by Greg Phillips ***
1: Andrew, based on your diag so far it has a blown head gasket. You jumped right to asking for an engine. Why does it need an engine? Fill in the gap, what has failed other than the head gasket? Have you found cracks with a borescope? Is there oil and coolant mixing severely? Are there pulled head bolt threads from the block?

Customer states running through coolant, when vehicle is hot and cap off of radiator bubbles can be seen

*** 07/17/2023 06:55:38 ***
Web - Diagnostics created on 07/17/2023 06:55:38 and created by Miguel Rodriguez
Verified concern, found exhaust gasses when testing coolant discoloration was also found, during inspection found there to be coolant leak seemed to be originating from head as can be seen going down head gasket, got pwa to perform tear down and inspection, when access made used 3/8 ratchet intake side of rear head all good with only 1 on exhaust found good 3 out of 4 found to easily back out with no effort done, was informed these head bolts are known for stripping in block as such creating techline case as to see were to continue, should new head bolts be installed or block replacement recommended

*** 07/17/2023 07:28:29 ***
Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin Default

*** Web - Advice created on 07/17/2023 07:30:53 and created by Adam Kazarian ***
1: Hello Miguel,

If the vehicle was under warranty we would advise new short block replacement, with new head bolts ordered. I would not advise to chance it with trying to have the block treads repaired on the vehicle due to labor involved and no way of confirming it will be trouble free.

*** Service Alert Escalated to CA as: 15675932 on 07/18/2023 01:04:51 (PST)

Customer states vehicle is overheating and coolant leaking into oil.

*** 07/12/2023 09:56:44 ***
Web - Diagnostics created on 07/12/2023 09:38:53 and created by Aaron Freeman
Vehicle came in there is no oil on the dipstick, there is oil in the cooling system reservoir, the radiator cap was removed and noted the inside of the radiator appears melted. 2qts of oil was drained from the engine and there is oil leaking from the pressure switch. The coolant reservoir seems to have been pressurized causing coolant/oil mixture to be sprayed along the passenger frame rail of the vehicle. I am thinking the head bolts pulled the threads out of the block allowing the coolant and oil to mix due to the clamping pressure failure on the head gasket.

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin Default

*** Web - Advice created on 07/12/2023 10:16:13 and created by Martin Lopez ***
1: Hello Aaron,

- Thanks for the information.

Based on the information, please check for loose head bolts. Based on alike situations, the head bolts may pull loose from the block.
Please note which head bolts are loose and attempt to re-torque the head bolts to see if any bolts hold. If you find any damage, please provide a video with VIN of the stripped threads and photos.
Thanks.

*** 07/17/2023 13:41:31 ***
Web - Note created on 07/17/2023 13:41:31 and created by Aaron Freeman
Inspected and found the top corner bolt furthest away from the timing chain on the front cylinder head has pulled the threads in the block. It spins freely and when removed has the block threads still on it.

1: Thank you for the information and video. Need the following.
- Attach a copy of current repair order, front and back, need to see technician notes documenting findings.
- Remove engine oil dipstick and attach a clear photo showing current oil level and condition, looking for coolant or moisture.
- Check transmission fluid level, looking for coolant contamination. If not overfilled, drain some fluid for inspection.
- Attach a short video showing VIN, odometer and technician performing block check, need to see chemical change color.
- Is this vehicle overheating? What is the customers concern?

1: Thank you for the information and attachments. Based on information provided, I recommend removing the heads for gasket and head inspection and relacing the transmission warmer.
We will need to tear down the engine. Please remove the camshafts and try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose.

If unable to torque the head bolts because they are striped. Please remove stripped bolts and attach photos showing block aluminum treads on the bolt(s), then I will approve a PWA case for the short block replacement, thank you.

1: Thank you for the attachments. The attachments you have sent in is acceptable showing the cylinder block treads have come out and engine needs replacement.

I have generated and approved a PWA case for you. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please refer to Pitstop PS539 for Engine Component Re-use Guidelines.

If the heads are not warped or damaged, I would recommend sending them out for pressure checking and a valve job.

If heads are warped or damaged, I would recommend a long block be used if available.

If there is no long block available and the heads are not reusable, they will need to be replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA(buckets) if applicable, so the valve clearance can be adjusted properly.

For GDI Engines handling and service procedures, please refer to service info and TSB ENG083. Thank you.

1: Good morning Jonathan,

Thank you for the information. The mileage and the year of the vehicle show that this would be covered under warranty. We have seen some issues with the head gasket failures. We will need to R&R the cylinder heads. But first we need to check a few things.

We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the OCV'S. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.

1: Jeffrey,
I am unable to see anything concern an oil leak in the pictures.
If you are sure this is from the head gasket than follow the provided information and when done provide the results.

Please access the cylinder head bolts and see if the bolts will retain 50 FT LBS of torque by using a torque wrench.
If an issue is found remove the head bolts and provide a picture
of the head bolt threads.

Thank you.

1: Jeffrey,
Thank you for the information.
Based off your provided information. I am going to generate a PWA case for engine replacement.
Please see if a long block is available and if ones not than make sure to check the cylinder heads for warpage using a machinist straight edge per the procedure listed in the shop manual.

If the cylinder heads are warped than they will also require replacement.
Thank you.

1: Hello Nghia,

- There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

1: Thank you for the video showing the threads in the block are stripped for the head bolts. I didnt see any sludge in the engine either to indicate a lack of maintenance.
2: Please obtain approval from the DPSM to inspect and remove the heads. We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

If the heads are not warped, I would recommend sending them out for pressure checking and a valve job. If they are warped, I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA (buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

Please strait edge the heads. If they do need to be replaced, please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleries as well.

Accepted, from Queue = TL_Sorento_Sportage_Telluride to WIPBin default

*** Web - Advice created on 08/29/2023 07:19:53 and created by Greg Phillips ***
Advice 1: Jermaine, is there an excessive amount of coolant in any of the cylinders? And which bank is leaking? It's kind of unusual to see both unless the overheat was severe. Are there signs of damage to this engine?

*** Web - Advice created on 08/31/2023 14:00:41 and created by Greg Phillips ***
Advice 1: I would approach this like you were going to replace the head gasket and inspect the block and head. If you find loose head bolts along the way, stop, see if there are pulled block threads on them and attach a photo. Some you can reach without removing the camshafts, I would start with those.

*** 09/05/2023 08:06:53 ***

*** Web - Advice created on 09/11/2023 13:56:29 and created by Eric Patterson ***
Advice 1: We will need to tear down the engine. Please try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Please also check for metal in the ocv's. If either of these two items has failed inspection, please let me know before continuing. Please add picture of the stripped bolts if they will not hold, then I will approve the PWA case for the short block replacement.
B1: Please obtain approval from the DPSM to inspect and remove the heads. If the Block is needed due to the thread concern, I will approve the engine PWA for you. Thank you. C: We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

*** Web - Advice created on 09/12/2023 10:24:35 and created by John Rehm ***
Advice 1: David,
If the heads are not warped, I would recommend sending them out for pressure checking replace seals and check the guides. If they are warped, I would recommend a long block be used if available. If there is no long block available, the heads will need to be replaced and the valvetrain components swapped over. Please make sure the new camshafts are installed when sending to the machine shop with all the MLA(buckets) so the valve clearance can be adjusted properly.
Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks
Please strait edge the heads. If they do need to be replaced, please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleys as well.

Advice 1: Thank you.

- Based on this information, the cylinder head or heads will need to be removed for inspection,

>>>BUT FIRST;<<<

There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of

the stripped threads, and include a clear view of the VIN. Please report your findings.

Allow Auto PWA Case checked on 10/24/2023 7:56:14 and checked by Edgar Urquiza

*** Web - Advice created on 10/24/2023 07:56:24 and created by Edgar Urquiza ***

Advice 1: Please use the Create PWA Case tab that I have enabled and provide all the required information for final review. It looks as if you have all the information to approve a case, however, the engine diagnosis portion needs to be completed.

If the PWA Case tab does not allow you to create a case, then please fill out the engine diagnosis tab in this RA case. An Auto PWA will not be allowed in some cases due to the conditions being outside the guidelines of the campaign. Once you have filled out the engine diagnosis tab I will review and approve if all looks ok.

*** 10/24/2023 08:50:08 ***
I have generated and approved a PWA case for you.

*** Web - Advice created on 10/24/2023 08:50:03 and created by Edgar Urquiza ***

Advice 1: If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, especially the OCV Valves, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments.

*** 10/24/2023 08:50:08 ***

- If you do a block test, does it pass?

If you leave the vehicle running and have some one raise the RPMS are you able to see air bubbles escape into the reservoir?

Thanks.

*** 11/07/2023 07:08:40 ***
Web - Note created on 11/07/2023 07:08:40 and created by Jorky Gonzalez
Allow me to re start again and i apologize for not being clear. this vehicle was here on a previous visit for a no heater concern. verified the vehicle had no heat. found the heat would only work when revving the engine and when driving but at idle only cold/warm air was coming out. performed a coolant bleeding procedure and the issue was still there. removed and replaced the thermostat and bleed the cooling system by lifting the front end of the vehicle. heater inside the cabin started working. returned the vehicle back to the customer and the customer came back a week later stating the issue was still there. found the coolant reservoir was very low. performed another bleeding procedure and the issue was still there. flushed the heater core with a water hose and found a good flow on the system. performed a vacuum fill and the issue was still there. checked the temp on all the hoses with the water temp at 212.9F the heater core hoses where at 143F on the top hose and 125F on the lower hose. checked the radiator hoses and the top hose was at 155.5F and the bottom hose at 97.5F also checked the radiator temp and the bottom was at 90f and the top at 115F. temp was changing a lot and couldn't get an accurate measurement. removed and replaced the water pump thinking it wasn't flowing the coolant properly even though the vehicle wasn't overheating. bleed the cooling system and test drove the vehicle. saw an abnormal amount of white smoke coming out of the tailpipe, and the heater was working properly while driving but as soon as I came to a stop on a red light the heater was blowing warm/cold air again. performed a block test but it passed. i also saw on bubble coming out of the funnel here in there but hard to catch unless i record for a long time. i also re cheked the temperatures on another simial vehicle and the temps where about the same.

*** Web - Advice created on 11/07/2023 08:17:26 and created by Martin Lopez ***

Advice 1: Thanks for the information.

- With the abnormal amount of white smoke coming from the tail pipe and continues loss of coolant, the vehicle is consuming coolant.

- The only area you have sings of coolant is only the front cylinder head correct?

- How do your sparkplugs condition look?

*** 11/14/2023 07:25:41 ***
Web - Note created on 11/14/2023 07:25:40 and created by Jorky Gonzalez
Yes the front cylinder seems to be the only one with a minor external leak. I submitted a picture of cylinder 2,4,6 sparks plugs from left to right.

*** 11/14/2023 07:25:43 ***
IMG_1663.jpeg added by Jorky Gonzalez on 11/14/2023 07:25:42

*** Web - Advice created on 11/14/2023 08:06:59 and created by Martin Lopez ***

Advice 1: Thank you.

- Based on this information, the cylinder head or heads will need to be removed for inspection,
>>>BUT FIRST;<<<

There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

scanned and there is no codes for engine ,and created vdn . oil level looks clean and good , coolant at reservoir is empty and has milky oil in it , same at radiator side is full but has oil in it , customer said he is master tech at another brand and when found oil in coolant performed coolant flush and cleaned the reservoir , now 900 miles later oil is back in coolant . i performed pressure test at coolant and there is no exterior leaks . also found little wet spots of oil seepage around head gaskets in both sides .

Advice 1: Hello Yeison,

- Based on this information, the cylinder head or heads will need to be removed for inspection,

>>>BUT FIRST;<<<

There have been cases where the treads in the block that are for the head bolts, strip out. Once the cams are removed, loosen all of the head bolts to see if any of them are looser than the others. If this is the case, then try to re-torque those bolts to see if the threads in the block will hold. If they do not, then the block will need to be replaced. The cylinder heads will also need to be replaced if either is warped beyond specifications. If you find any damage, please provide a continuous video of the stripped threads, and include a clear view of the VIN. Please report your findings.

*** Web - Advice created on 11/14/2023 15:25:40 and created by Jeffrey Minderhoud ***

Advice 1: Based on the information you provided we will need to tear down the engine. Please get dpsm authorization for this inspection. Try and torque down the engine head bolts to 75 ft lbs and make sure none of the head bolts are stripped or loose near the affected leakage of the head gasket. Record a short video of the attempt to torque the bolts or the stripped threads. Make sure to show the valve train condition so we can see if there is any sludge present and get the vin on the vehicle in the video and attach to the case. Thank you.

*** Web - Advice created on 12/11/2023 10:58:03 and created by Jeffrey Minderhoud ***

Advice 1: I see the valvetrain looks clean and there is no sludge.

Advice 2: Please obtain approval from the DPSM to inspect and remove the heads. We will need to measure the cylinder heads and the block for warpage and see if they are within specs.

If the heads are not warped, I would recommend sending them out for pressure checking and a valve job. If they are warped, I would recommend a long block be used if available. if there is no long block available the heads will need replaced and the valvetrain components swapped over, please make sure the new cams are installed when sending to the machine shop with all the MLA (buckets) so the valve clearance can be adjusted properly. Please use a long block if the heads are warped. If the heads are ok send them out for pressure checking and replace seals and check the guides. Then replace the re man short block. Thanks

Please strait edge the heads. If they do need to be replaced, please make sure you transfer the valve train components and make sure all the check balls are installed in the oil galleries as well.

*** Web - Advice created on 11/20/2023 08:01:56 and created by Adam Kazarian ***

Advice 1: Hello Michael,

It does seem like head gaskets may be blown from both heads. Prior to removing the heads.

If you pressure test the coolant system again check with a borescope if the cylinders have coolant in them and if you think it is likely that they may have bent a rod or caused bottom end damage or rust in the cylinders for the coolant leaking.

Let me know what you find.

*** Service Alert Escalated to CA as: 15988203 on 11/21/2023 01:02:49 (PST)
*** 11/30/2023 08:42:48 ***
Web - Note created on 11/30/2023 08:42:48 and created by Michael Colegrove
removed intake and pressure tested coolant system with engine cold and coolant system has held 21 psi for 45-60 mins and no coolant in cylinders

*** 12/05/2023 09:37:20 ***
Web - Note created on 12/05/2023 09:37:19 and created by Michael Colegrove
should i be looking to do a engine replacement or just head gaskets

*** Web - Advice created on 12/07/2023 11:40:20 and created by Adam Kazarian ***

Advice 1: At this point it would seem the blown head gasket is blown. Removing the cylinder head and checking the block and head for warping, cracks, or damage is the next step to see if we only have headgasket fault or further damage.

if you think it is likely that they may have bent a rod or caused bottom end damage or rust in the cylinders for the coolant leaking. If the head is found to be warped upon removal and the block is in good standing the head needs to be replaced along with gasket. Note: Upon removing of the head note if any bolts are loose or found to be stripped off in the block.

Send to:[LaChapelle, Paul [KMA]]
Paul,
It looks like this is going to have to re repaired with a New LONG BLOCK. Dealer may want to look at what a NEW short block and the NEW head that was machined replacement expense is
State repair disclosure laws may come into play here due to this is still a "NEW" vehicle being never sold.

Thanks
BOb

*** Performed by contact: Robert Preston, 7248377000
*** This is a Request for Assistance ***

Problem Description :
Coolant leak, causing engine to overheat. Engine stalled after received(overheated), and would not restart until temp lowered.

Inspected at another dealer in Florida on 2/4/14 at 3200 miles for a coolant leak, but none was found at that time.

Diagnostics Performed :
Found coolant leaking past squeeze clamp on upper heater core hose, at the heater core. Combustion chamber pressure leaking into cooling system, as engine RPM is raised the cooling system pressure increases.

No coolant in front cylinders, have not yet removed intake plenum to inspect rear cylinders. Suspecting warped head(s) at this time due to no start when hot.

*** PHONE LOG 08/04/2014 12:24 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Perform a cylinder leak down test to verify coolant leak into the combustion chamber. If air escapes through the cooling system then remove the cylinder heads and measure the head and block surface flatness as outlined in KGIS. If the heads or block are warped beyond specification then they will need to be replaced. DO NOT RESURFACE.

*** NOTES 08/04/2014 12:26 PM clarify Action Type: Dealer contact
*** Performed by contact: Robert Preston, 7248377000
Result of Advice 1:Just pulled DTCs and found a P0197(Engine oil temp sensor low input), and freeze frame shows coolant temp at 296F.
Additional Comments:Am proceeding with leakdown test at this time.

*** Performed by contact: Thomas Hill, 8602917000
*** This is a Request for Assistance ***

Problem Description :
customer complaint is leaking coolant and overheating removed coolant cap found radiator and cap full of what looks like peanut butter no coolant in system filled with coolant and found lots of bubbles that keep coming up out of radiator cap found heater core lines melted and a big hole in the line that has coolant poring out of it all the other coolant lines are melted as well I think the head gaskets are blown and made the leak or the leak started and then blew the head gaskets but I think it needs a long block a radiator and coolant lines. what do you think?

Diagnostics Performed :
coolant leak test

*** PHONE LOG 11/11/2014 08:01 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Thomas, please take pictures of the melted components and the hole in the heater lines. E-mail all pictures to BLall@kiausa.com and include the case number in all e-mails.
Advice 2: Usually when a head gasket blows it is the result of overheating caused by another failure. From your description, it sounds like this vehicle was severely overheated. I do not know if the hole is a result of the severe overheating or the cause. It is very important after the repairs have been performed on this vehicle to check all cooling system components to make sure they are operating correctly including the thermostat and cooling fans.

Advice 3: Please perform a cylinder leak down test on all cylinders and note the percentage of leak down and note where the air is escaping from during the test (radiator, intake, exhaust, another cylinder, or crankcase) and inspect the spark plugs. Let me know what you find. Thanks.

*** PHONE LOG 11/11/2014 10:17 AM Pacific Daylight Time BLall-TL Action Type:Ltr/email/fax rec'd
Advice 1: Thomas, I got the pictures and have attached them to the case for reference. Please proceed with the previous

advice and let me know what the results of the testing is. Thanks.

*** NOTES 11/11/2014 11:26 AM clarify Action Type: Dealer contact
*** Performed by contact: Thomas Hill, 8602917000
Result of Advice 1:performed cylinder leak test all cylinders had 0% leak down but when testing #2 if left pressurized for about 30 seconds coolant will start to leak out of one of the coolant hoses that are disconnected consistent drip.
Additional Comments:what would you like to do?

*** PHONE LOG 11/11/2014 12:05 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: I am not sure how it shows 0% leakage if it causes coolant to get pushed out. Your testing indicates to me that at the very least there is a blown head gasket, possibly damage to the head or block as well.
Advice 2: My recommendation is to contact your DPSM for authorization to remove the heads and inspect the head gasket and all surfaces and components for damage or to replace the long block. Thanks.

Problem Description :
coolant is leaking from bank1 cylinder head gasket making a crusty trail down the side of the block.

Diagnostics Performed :
have there been problems with head gaskets or possibly defects in head or block mounting surfaces?

*** PHONE LOG 01/02/2015 06:26 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Hello Matt, I have seen a few cases on these and found a coolant leak from a bolt hole that is not used so it is an open passage. If the hole was drilled to far that will cause a leak and makes it look like a head gasket leak. I would remove the exhaust manifold on that side and think you find this is the concern. If you can not tell pressure the cooling system and recheck.
If you find this is the concern then install a plug into the threads with sealant. Then recheck by pressurizing the cooling system one more time. Let me know Thanks.

Problem Description :
Can smell coolant and resevoir low.

Diagnostics Performed :
Inspection revealed coolant leaking from LH exhaust manifold gasket area. Performed coolant system pressure test. Started at 15 PSI and in approx. 30 minutes dropped 4-6 PSI and coolant had seaped out of manifold gasket area. performed cylinder leak down test on cylinders 2,4, and 6. All had 100% leak down with air escaping from throttle body. I have not performed leak down test on RH bank but will if tech line requests.

*** PHONE LOG 01/07/2015 08:31 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Hello, I have seen a few cases on these and found a coolant leak from a bolt hole that is not used so it is an open passage. If the hole was drilled to far that will cause a leak and makes it look like a head gasket is leaking. I would remove the exhaust manifold on that side and think you find this is the concern. If you cannot tell pressure the cooling system and recheck. If you find this is the concern then install a plug into the threads with sealant. Then recheck by pressurizing the cooling system one more time. Let me know Thanks.

*** PHONE LOG 01/08/2015 10:43 AM Pacific Daylight Time DRichmond Action Type:Incoming call
Advice 1: Tech called in, states is it leaking from a few the bolt holes and wanted to know what kind of sealant to try. Advised tech sealant that will resist heat a coolant. perform the repair and pressure test again before re-installing the manifold.

*** NOTES 01/10/2015 12:08 PM clarify Action Type: Dealer contact
*** Performed by contact: Eric Schramm, 3867347800
Result of Advice 1:Installede a plug fabricated from an exhaust manifold stud with Kia gray rtv silicone gasket maker applied into three blank holes and two manifold studs. I let rtv cure for approx. 3 hours then pressure tested. I still have coolant seaping from one of the blank holes.

*** PHONE LOG 01/10/2015 01:30 PM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: does this blank hole have threads like the others or ? Thanks.

*** NOTES 01/12/2015 04:54 AM clarify Action Type: Dealer contact
*** Performed by contact: Eric Schramm, 3867347800
Result of Advice 1:Yes it does. I applied Kia gray silicone rtv to the threads and let cure for approx. 3 hours before I pressure tested. Do you recommend I retry this one?

*** PHONE LOG 01/12/2015 06:12 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Lets try this one more time, if no help might need to replace the head.

*** PHONE LOG 01/12/2015 10:02 AM Pacific Daylight Time DRichmond Action Type:Incoming call
Advice 1: Tech called, still leaking and knows it's leaking form the cylinder casting. Advised tech to replace the cylinder head to repair this concern.

*** PHONE LOG 01/14/2015 07:19 AM Pacific Daylight Time DRichmond Action Type:Incoming call
Advice 1: Tech is replacing the head and wanted to know if it is ok to re0use original parts or use all new parts.
Advised tech in the case, where the complaint was only a coolant leak, as long as the vehicle did not over heat re-using original parts will be fine but replace any seal such as cams shaft and so on.

Problem Description :
The customer came in due to there heater not being hot. Found that the coolant is low. the vehicle is loosing coolant.

Diagnostics Performed :
The first time this vehicle came in for this concern. I found that the Thermostat/coolant pipe assembly was leaking and replaced it. Blead the air out of the system. The vehicle came back. I found the system low again, so I topped it off. Double checked for an external coolant leak. found no leak. The system is now low yet again. There is a faul smell coming from the coolant system, Like exhaust or a burnt oil type smell. You can see air bubbles in the reservoir. Already replaced the radiator cap with a known good part.

*** Performed by contact: Josh Martin, 2546992909
*** This is a Request for Assistance ***

Problem Description :
vehicle initially came in for a coolant leak

Diagnostics Performed :
was determined to be coming from the corner of the head gasket. service manager approved tear down of the head to send it to machine shop for inspection...while pulling the head bolts we found that the threads had been pulled out with the bolt closest to the leaking corner. vehicle will need a short block. manager wants techline confirmation before he will approve a short block

*** PHONE LOG 01/15/2015 06:48 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Josh, if there was a coolant leak from the head gasket and the threads in the block for the head bolt are damaged, my recommendation is to replace the short block and send the head to be checked and if warped to replace the head as well (it is likely warped from the uneven clamping pressure of the head bolts). It may be more efficient to replace the long block in this situation but it is up to your DPSM how they want you to proceed.
Advice 2: Please contact the DPSM for approval to replace the short block and check/replace the head as needed or to replace the long block. Thanks.

Result of Advice 1:the oil level was 1/2 a quart low
Result of Advice 2:Lt bank 1- 1.0

Ltbank 2- 1.0
Result of Advice 3:The plugs are oil fouled

*** PHONE LOG 02/11/2015 07:21 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Thanks, we need to perform compression and leak down test on all cylinder and please note the readings. Then for the leak down note where the air is going such as crank case, intake or exhaust. Thanks.

*** NOTES 02/11/2015 11:05 AM clarify Action Type: Dealer contact
*** Performed by contact: William Lucas, 9103501650
Result of Advice 1:trying to run the compression test, what command do I use in the gds to get the engine to turn over

*** PHONE LOG 02/11/2015 11:10 AM Pacific Daylight Time DRichmond Action Type:Outgoing call
Advice 1: There is not one, disable the fuel system and crank the engine over to perform the compression test.

*** NOTES 02/11/2015 11:52 AM clarify Action Type: Dealer contact
*** Performed by contact: William Lucas, 9103501650
Result of Advice 1:I have 180-182 psi compression across the board, while performing the compression test I noticed the intake values are excessively fuzzy from oil deposit. knowing this should I continue with the leak down test?

*** PHONE LOG 02/11/2015 12:15 PM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Do the leak down to see where the air is going. Thanks.

*** NOTES 02/11/2015 01:26 PM clarify Action Type: Dealer contact
*** Performed by contact: William Lucas, 9103501650
Result of Advice 1:while using my snap-on leak down tester I have an adapter attached to the hose so it will fit into the plug hole, when I get the leak down set to set pressure there is no leak indicated on the gauge on 1,2, and 4. if I hold the pressure on it to long it blows the o-ring on the leak down hose.

*** PHONE LOG 02/12/2015 06:17 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Pull the intake and exhaust manifold, look at the valve stems through the intake and exhaust ports, do you see oil on the valve stems?

*** NOTES 02/12/2015 11:59 AM clarify Action Type: Dealer contact
*** Performed by contact: William Lucas, 9103501650
Result of Advice 1:on the intake side yes its burnt old oil. looks like old caked on oil deposits on the intake side, on the exhaust side everything looks normal.

*** PHONE LOG 02/12/2015 01:17 PM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: That means the valve stem seals are leaking if you are seeing oil in the valve stems so replace the seals and clean the valves and have the head checked if need be. Replace the spark plugs also. Then retest.
Advice 2: Also make sure the PCV valve is not sticking and have vacuum to the valve.

*** NOTES 02/26/2015 06:36 AM clarify Action Type: Dealer contact
*** Performed by contact: William Lucas, 9103501650
Result of Advice 1:removed heads to have valve seals installed. cylinder 2 upper head bolt was seized. it pulled the threads out of the engine block. Suggestions?
Result of Advice 2:cylinder 2 head bolt seized and pulled threads out of engine block

*** PHONE LOG 02/26/2015 06:52 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: If this was anything but a head bolt I would say use a thread repair kit but since this is a head bolt, I will say contact DPSM for at least a short block replacement depending on what you find with the head. Thanks.

Problem Description :
Customer states there is a coolant smell when veh. is on and when shutting off. I duplicated the concern and found dried coolant accumulation on front cylinder head. (can I get an email to send pictures please)

Diagnostics Performed :
I performed a pressure test on coolant system and was not abel to see where leak was coming from. Pressure was droping very little. I had to removed exhaust manifold to see where it was coming from and it is coming from cylinder head ares. Looks like there is a tiny crack on the head.

*** PHONE LOG 03/11/2015 02:36 PM Pacific Daylight Time DFinkelstein-TL Action Type:Outgoing call
Advice 1: Juan, if you have performed a cooling system pressure test and it appears to be coming from the head then you'll need to determine if its the head gasket or porious head casting that is at fault. If it's a porious head then it would have to be replaced . If it's a head gasket (also do cylinder leakdown testing with radiator cap removed on all cylinders) then just replace the head gasket .

*** CASE CLOSE 04/22/2015 08:17 AM clarify
*** Performed by contact: Juan Bernal, *08232010063514
Replaced right side cylinder head. assembled engine, performed pressure test, no more leak detected.

Problem Description :
CUSTOMER STATES VEHICLE IS LEAKING COOLANT

Diagnostics Performed :
PULLED VEHICLE IN SHOP PREFORMED COOLANT PRESSURE TEST VEHCILE WAS LOOSING PRESSURE BUT VERY VERY SLOWLEY PUT VEHCILE ON RACK AND RASIED UP IN THE AIR REMOVED DUST COVER FOUND TRACES OF COOLANT ON STARTER AND BOTTOM OF EXHAUST MANIFOLD ON FRONT HEAD OF MOTOR VERIFIED THAT COOLAT IS NOT COMING FROM THERMOSTATE HOUSING COOLANT ONLY ON EXHAUST AND DRIPPING DOWN ATTACHED PICTURES

*** PHONE LOG 03/24/2015 05:05 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Contact your DPSM for approval to remove the front cylinder head for inspection.

*** NOTES 03/27/2015 04:40 AM clarify Action Type: Dealer contact
*** Performed by contact: Robert Flewellyn, 4789888444
Result of Advice 1:removed head and had head sent off to machine shop head came back and checked out ok not cracked

*** PHONE LOG 03/27/2015 04:51 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Hopefully the machine shop did not surface the head, if they did it will now need to be replaced. If the cylinder head and block surface flatness is with in specifications then install a new head gasdket and reassemble.

*** NOTES 03/27/2015 04:54 AM clarify Action Type: Dealer contact

*** Performed by contact: Robert Flewellyn, 4789888444
Result of Advice 1:the did not surface the head they just pressure checked it and said it was flat did not need to be machined

*** PHONE LOG 03/27/2015 05:03 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Does it appear that the leak was coming from the head gasket?

*** NOTES 03/27/2015 05:10 AM clarify Action Type: Dealer contact
*** Performed by contact: Robert Flewellyn, 4789888444
Result of Advice 1:yes from what I saw it was either head was gonna be warped or a faulty head gasket from factory it was more like the head gasket was faulty around the cylinder walls though as there was traces of coolant on valves

*** PHONE LOG 03/27/2015 05:13 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: If the block surface flatness is with in specifications then reinstall the head with a new gasket and report your results.

*** CASE CLOSE 04/02/2015 10:04 AM clarify
*** Performed by contact: Robert Flewellyn, 4789888444
replaced head gasket

*** NOTES 04/03/2015 10:42 AM clarify Action Type: Dealer contact
*** Performed by contact: Robert Flewellyn, 4789888444
Result of Advice 1:vehicle is back after head gasket replacement, vehicle is still leaking coolant in the same area (exhaust port) driping down the cat and on the the starter and then to the floor attached another picture in case

*** PHONE LOG 04/03/2015 10:44 AM Pacific Daylight Time JLancaster-TL Action Type:Web Contact
Advice 1: Tech called in and stated the vehicle returned, upon inspection found coolant leaking from the same spot as before cylinder head where the exhaust manifold bolts to the cylinder head. I asked him to take another picture of the leak and send to elancaster@kiausa.com and include the case notes.
Advice 2: It sounds like coolant is coming from the cylinder head threads for the exhaust manifold studs, please confirm and report.

*** NOTES 04/03/2015 11:25 AM clarify Action Type: Dealer contact
*** Performed by contact: Robert Flewellyn, 4789888444
Result of Advice 1:email with picture sent to above stated email
Result of Advice 2:appears coolant is only coming from left cylinder head and it is coming from exhaust ports

*** PHONE LOG 04/03/2015 12:54 PM Pacific Daylight Time JLancaster-TL Action Type:Web Contact
Advice 1: Thank you for the picture, please contact your DPSM for cylinder head replacement.

*** This is a Request for Assistance ***

Problem Description :
customer states heater doesnt get warm and blows colder at stopes

Diagnostics Performed :
checked coolent levels,coolent levels low .. the veh was here a couple weeks back for the same thing another tech before that replaced a hose , so we pressured tested coolent system .coolent system held pressure . could not find any leaks then.looks like dried coolant on back side(towards firewall) of cylinder block(just below head gasket surface).You guys seen this?Could be bad pressure cap(intermittenly)?Thanks

*** PHONE LOG 04/29/2015 05:13 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Hello Chris, first I would confirm if the hose that was replaced is close to the location where you are seeing the dried coolant even just so we know. If it came in 2 times for low coolant it has to be going somewhere. Im concern with possible head gasket leak or coolant getting into the cylinders so how does this engine run? Any problems?
You could pull the spark plug and look for signs of coolant on the plugs and in the cylinder with boroscope. Then go from there.

*** NOTES 04/29/2015 05:23 AM clarify Action Type: Dealer contact
*** Performed by contact: Milton Williams, 4323320441
Result of Advice 1:Hello Dave,this is milton williams.It is the head gasket,e-mailed you a couple pictures.Thanks

*** PHONE LOG 04/29/2015 06:25 AM Pacific Daylight Time DRichmond Action Type:Outgoing call
Advice 1: I received the pictures and will attach them to the case.
Advised tech to remove the manifold and look for a leak form a NON used bolt hole and see if that is where the leak is coming

from before we go after a head gasket. Thanks.

*** PHONE LOG 05/07/2015 11:21 AM Pacific Daylight Time JThompson-TL Action Type:Incoming call
Advice 1: Milton called in stating they verified leak from head gasket. Upon reinstalling and torquing cyl. head one of the head bolts pulled out the threads from the block. Advised to contact DPSM for authorization on how to proceed with repair.

*** NOTES 05/07/2015 11:36 AM clarify Action Type: Dealer contact

*** CHNG CONTACT 05/07/2015 12:28 PM Pacific Daylight Time DRichmond
Contact changed from Christopher Marafioti at Kelly Grimsley Kia to Milton Williams at Kelly Grimsley Kia. Former primary phone: (432) 332-0441. Former alternate phone: .

*** PHONE LOG 05/07/2015 12:36 PM Pacific Daylight Time DRichmond Action Type:Outgoing call
Advice 1: Called tech per request. Tech was following the procedure on KGIS for head bolt tightening torque and the threads pulled out of the block on the same bolt where the original gasket was leaking. I verify the specs that MIlton was following and tech was following the correct specs and procedure. I copied them in below.
Tightening torque
Head bolt:
37.3 ~ 41.2 N.m (3.8 ~ 4.2 kgf.m, 27.5 ~ 30.4 lb-ft) + (118 ~ 122°) + (88 ~ 92°)
Advised tech to contact DPSM for approval based on what parts are available either long block incase head is warped or short block and related components.

customer came in with complaint of coolant being low in the reservoir.

Diagnostics Performed :
coolant reservoir is almost empty and coolant looks as if it is leaking from both of the exhaust manifolds or manifold gaskets on the bottom of each one. Pressure test slowly loses psi. Will send photos once I get an email address.

*** PHONE LOG 07/29/2015 10:53 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Hello and good job. I have seen a few cases on these and found a coolant leak from a bolt hole that is not used so it is an open passage. If the hole was drilled to far that will cause a leak and makes it look like a head gasket is leaking. I would remove the exhaust manifold on that side and think you find this is the concern. If you cannot tell pressure the cooling system and recheck.
If you find this is the concern then install a plug into the threads with sealant. Then recheck by pressurizing the cooling system one more time. Let me know Thanks.

Advice 2: Instead of e-mailing it to us Please refer to Pitstop article PS410 showing detailed information on how to add FFD, picture, video's and flight recording's to a case. This method is more efficient and helps with our work load. Then add a note to the case once you attach any documents or recordings or we will not know it is there. Thanks.

*** NOTES 07/29/2015 11:34 AM clarify Action Type: Dealer contact
*** Performed by contact: Brett Beilke, 5073454542
Result of Advice 1:It is coming from both exhaust manifolds also some where the oil usually leaks down if the oil switch was leaking. Attached photos.

Result of Advice 2:Attached photos

*** PHONE LOG 07/29/2015 12:53 PM Pacific Daylight Time DRichmond Action Type:Incoming call
Advice 1: I see the picture but some what hard to see. Did you remove the manifold yet because by the pictures I cannot tell ?

*** NOTES 07/30/2015 04:53 AM clarify Action Type: Dealer contact
*** Performed by contact: Brett Beilke, 5073454542
Result of Advice 1:No, pictures are with the manifold still on. I am waiting for new manifold gaskets before I take the manifolds off.

*** PHONE LOG 07/30/2015 05:41 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Thanks for the update.

*** NOTES 08/04/2015 07:23 AM clarify Action Type: Dealer contact
*** Performed by contact: Brett Beilke, 5073454542
Result of Advice 1:Added 2 new photos. In the photo with the mirror if you look you can see a hole in the threads about half way up.

*** PHONE LOG 08/04/2015 08:40 AM Pacific Daylight Time DRichmond Action Type:Web Contact
Advice 1: Thanks for the update and I do see that, but since there are no coolant passages even a loose manifold will not cause this leak (just FYI) so try adding sealant with the stud re-installed and pressure the cooling system. If it still leaks then the head will need to be replaced. let me know. Thanks and good job.

*** NOTES 08/07/2015 06:34 AM clarify Action Type: Dealer contact
*** Performed by contact: Brett Beilke, 5073454542
Result of Advice 1:Plugged the extra holes for the exhaust manifold studs. Drove vehicle and did not appear to be leaking. Customer took vehicle and will come back in a couple weeks to re check.

*** CASE CLOSE 08/07/2015 06:35 AM clarify
*** Performed by contact: Brett Beilke, 5073454542
plugged holes in cyl. head manifold studs.

*** PHONE LOG 01/12/2016 01:47 PM Pacific Daylight Time JGossling-TL Action Type:Incoming call
Advice 1: Brett called in to have case reopened and stated the studs are still leaking. I check with the Model Engineer and he stated to replace the cylinder heads. I advised Brett of this information.

*** NOTES 01/15/2016 07:44 AM clarify Action Type: Dealer contact
*** Performed by contact: Brett Beilke, 5073454542
Result of Advice 1:Been in contact with my DPSM and he advises that I should replace long block because it is more cost efficient. Do we need your approval and should I start a PWA?

*** PHONE LOG 01/15/2016 07:53 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Brett,
I can only recommend to replace the cylinder heads as this is what the Model Engineer requested so don't replace the long block. Thank you

*** NOTES 01/26/2016 07:26 AM clarify Action Type: Dealer contact
*** Performed by contact: Brett Beilke, 5073454542
Result of Advice 1:Just received one cylinder head and parts and gaskets. The other cylinder head being shipped by Ups and

has switched to pending out of Memphis Tn, possible cylinder head damage. Can not get another available head from kia currently. This is the 4th time car is back for the coolant leak. Customer wants car fixed now.
Additional Comments:Will hopefully hear in a couple hours from UPS about the status of the other cylinder head.

*** PHONE LOG 01/26/2016 07:32 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Brett,
Thank you for the update. Please keep me posted. Thank you

*** Performed by contact: Nathan Followell, *12152010110513
*** This is a Request for Assistance ***

Problem Description :
customer states that oil is leaking from vehicle. customer has also stated in the past that when vehicle engine is first started after its been sitting over night the engine will run rough for the first mile or so. no check engine lights at all. custome

Diagnostics Performed :
tech found engine oil in the coolant and the coolant reservoir tank is over flowing and the oil is leaking from it. we checked for trouble codes no codes present and engine runs fine. engine is at operating temp.

*** PHONE LOG 08/19/2015 05:53 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Nathan. Is the engine coolant also contaminated with oil or only the reservoir?

*** NOTES 08/19/2015 05:58 AM clarify Action Type: Dealer contact
*** Performed by contact: Nathan Followell, *12152010110513
Result of Advice 1:the radiator also has oil in the coolant
Additional Comments:yes the engine coolant system has oil in it. we are the only service facilty to work on this vehicle (oil changes and maintance)

*** PHONE LOG 08/19/2015 06:17 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Nathan. Get approval to remove the cylinder heads and inspect for damage.

*** NOTES 08/20/2015 04:52 AM clarify Action Type: Dealer contact
*** Performed by contact: Nathan Followell, *12152010110513

Result of Advice 1:tech checked engine for running rough on cold start up after sitting all night
Additional Comments:watched gds for missfire counter in cylinders #2 cylinder was showing that it was miss fire for about 5 to 10 seconds.

*** PHONE LOG 08/20/2015 05:40 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Sounds like you are getting coolant into #2 cylinder. Let me know what you find with your inspections.

*** PHONE LOG 09/01/2015 06:38 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Nathan. Please provide detailed feedback in the case notes. Close this case and complete the Technician Satisfaction Survey if the vehicle is repaired. If you require further assistance, please contact Techline at (800) 494-4542 and put in the case number. Thank you.

*** NOTES 09/01/2015 10:53 AM clarify Action Type: Dealer contact
*** Performed by contact: Nathan Followell, *12152010110513
Result of Advice 1:tech found the head gasket leaking due to top three headbolts closest to the bell housing not torqued correctly.
Additional Comments:tech was dissembling the engine for inspection the top three headbolts closest to the bell housing broke loose with effort all the rest off the headbolts where real tight. Dpsm had us check the other head side headbolts we found 2 headbolts that broke loose around 20ft lbs of torque.

*** PHONE LOG 09/01/2015 11:29 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: If coolant has not gotten into the engine oil and damaged the bearings, replace the head gaskets and the head bolts and update this case. Thank you.

*** NOTES 09/01/2015 11:42 AM clarify Action Type: Dealer contact
*** Performed by contact: Nathan Followell, *12152010110513
Result of Advice 1:started to reassemble the engine the threads are bad in the block.
Additional Comments:started reassembling the engine today the threads are pulled in the block for the head bolts. will need either a long block or short block to repair engine.

*** PHONE LOG 09/01/2015 11:48 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Nathan. If the heads are okay, the short block should be sufficient for this vehicle. Update the case when the repairs are completed. Thank you.

*** Performed by contact: Branden Steeves, 3025272700
*** This is a Request for Assistance ***

Problem Description :
this is not a kia warranty this is an insurance claim. cust hit the trans cooler and kept on driving and over heated the engine bad to the point that it would not run. I found that lots of little bubbles were coming out of the cooling system after I filled it up with water while running so I figured that it popped a head gasket. did a comprsion check and got 180-185 on cyls. tore top end off and found a possible place where it may be blown. now my question is the heads are at the machine shop and they just called and said the heads are warped .005" how much can we get cut off these heads and still be in the safe zone? I looked and could not find a spec thanks branden

Diagnostics Performed :
compression check

*** PHONE LOG 10/27/2015 06:42 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Branden. Kia does not machine heads. The entire head warps not just the mating surface. If they are warped, they need to be replaced.

** Admin Note ***

Problem Description :
found thermostat housing leaking. replaced housing and retested vehicle and it is still over heating.

Diagnostics Performed :
performed coolant pressure test again and found it leaking on the front cylinder head between the block and head. does not appear to be the actual studs for the exhaust manifold like I have seen in the past this is the mating surface of head and block

*** PHONE LOG 10/27/2015 07:37 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: David, did you take a picture showing the source of the original coolant leak? Please take a picture showing the source of the leak between the block and the head. Attach all pictures to the case as per PS 410 and add a note stating they have been attached or I will not be notified.
Advice 2: Please remove the valve cover and check the torque on the head bolts in the area where the coolant leak is.

*** NOTES 10/28/2015 04:53 AM clarify Action Type: Dealer contact
*** Performed by contact: David Macklin, 3523651228
FOUND ALOT OF COOLANT MIXED WITH THE OIL, FROM THE BEST I COULD TELL THE HEAD BOLT IN THAT CORNER WAS AROUND 86FT LBS
Additional Comments:FOUND ALOT OF COOLANT MIXED WITH THE OIL, FROM THE BEST I COULD TELL THE HEAD BOLT IN THAT CORNER WAS AROUND 86FT LBS

*** PHONE LOG 10/28/2015 06:55 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: It sounds like the vehicle has at least one blown head gasket. Please perform a compression test. Make sure you have a charger on the battery, the injectors disabled, and the throttle wide open. Please also perform a cylinder leak down test on all cylinders and note the percentage of leak down and note where the air is escaping from during the test (radiator, intake, exhaust, another cylinder, or crankcase) and inspect the spark plugs.

*** NOTES 10/28/2015 08:10 AM clarify Action Type: Dealer contact
*** Performed by contact: David Macklin, 3523651228
Result of Advice 1:I PERFORMED THE COMPRESSION TEST BEFORE I REMOVED THE CAM SHAFT TO CHECK THE TORQUE FRONT BANK 150,153,132-WHERE THE LEAK IS. BACK BANK 150,173,170.
Additional Comments:IN ORDER TO DO THE LEAK DOWN I WOULD HAVE TO RETIME THE ENGINE AND PUT THE CAM BACK IN. DO I NEED TO DO THAT OR DO WE HAVE ENOUGH INFO SO FAR

*** PHONE LOG 10/28/2015 08:28 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: You can do the leak down test with the cams out. Without the cams all the valves will be completely closed so it should actually be a quicker test. Just be careful when you pressurize the cylinders if the cylinder is not at TDC or BDC it is going to be difficult to keep the crankshaft from rotating. Thanks.

*** PHONE LOG 10/28/2015 08:35 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: I am not trying to make you do additional work, I am just trying to find out if only one head or if both heads need to be removed. Thanks.

*** NOTES 10/28/2015 09:11 AM clarify Action Type: Dealer contact
*** Performed by contact: David Macklin, 3523651228
Result of Advice 1:USING 2 DIFFERENT LEAK DOWN GUAGES WITH THE CYL TDC IT SHOW 0 LEAK DOWN

*** PHONE LOG 10/28/2015 09:43 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Did you perform a leak down test on all the cylinders?
Advice 2: If the leak down does not show leakage, then please contact your DPSM for authorization to remove the head and check for warpage and damage to the block.

*** NOTES 11/02/2015 09:18 AM clarify Action Type: Dealer contact
*** Performed by contact: David Macklin, 3523651228
Result of Advice 1:YES
Result of Advice 2:REMOVED AND CHECKED HEAD AND BLOCK SURFACE AND THEY ARE WITHIN SPEC

*** PHONE LOG 11/02/2015 09:35 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: If no other damage was found, please replace the head gasket and retest. Thanks.

*** NOTES 11/06/2015 07:30 AM clarify Action Type: Dealer contact
*** Performed by contact: David Macklin, 3523651228

Result of Advice 1:PERFORMING PROPER TORQUE SEQUENCE AND 2 BOLTS PULLED THE THREADS OUT OF BLOCK. I WAS ON MY SECOND SWEEP AT ABOUT 60 FT POUNDS
Additional Comments:DUE TO THE UNKNOWN DAMAGE DUE TO THE OVER HEATING AND HOW BAD IT GOT I WOULD HOPE WE WOULD NOW REQUEST A LONG BLOCK ASSY

*** PHONE LOG 11/06/2015 07:56 AM Pacific Daylight Time BLall-TL Action Type:Incoming call
Advice 1: David called and advised me of the previous notes. Advised that the block is damaged and will need to be replaced. Advised to double check if the head is warped. Advised depending on the parts availability and the condition of the head, a long block or a short block should be replaced. Advised if available my recommendation is to replace the long block.
Advice 2: Advised David he will need to open a Separate Tech line Engine PWA Case in order to gain approval to replace the engine prior to replacing the engine. Please refer to Warranty Bulletin 2015-09 for further information on this policy. Please refer to this case number in the PWA case notes. Thanks. Make sure to attach the core data sheet that is filled out as much as possible and signed by the tech and service manager to the PWA case.

*** Performed by contact: Nicholas Panetti, 6103847700
*** This is a Request for Assistance ***

Problem Description :
customer states vehicle is leaking coolant and over heating.

Diagnostics Performed :
pressure tested cooling system noticed dried up coolant on and behind starter and around the front head gasket left bank. but found coolant leaking from thermostat housing and the seam of the two peaces. replaced thermostat housing ran vehicle found no leaks or over heating issues after repair. then vehicle return a couple of days later with same concern. i removed starter and determined coolant was in fact also leaking from head gasket. our DPSM gave us authorization to remove head and inspect cylinder head gasket. while removing the cylinder head i found the head blots to be loose and the front head bolt towards the trans was striped out the treads of the block came out the head bolt.

stripped head bolt holes in the cylinder block

Diagnostics Performed :
see tech line case t3098768

*** PHONE LOG 01/18/2016 01:42 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: William I reviewed the repair assistance case T3098768.
Advice 2: Before approval can be granted on this PWA request for engine replacement, please complete and sign the WRTY-143 core data form and ask your Service Manager to sign it as well. Attach the completed form to the case and add a case note informing us that you have done so. Please refer to Warranty Bulletin 2015-09 for more information. Once the form has been received, I will process your request. Thank you.

Advice 3: If you have already attached the form, please add a note letting me know. Sometimes it takes a short time before I can see it. If you have not attached it yet, when you do attach it to the case as per PS410 add a note to the case or I will not be notified. Thanks.

Advice 1: I am not sure why you are getting that error message but the form is attached to the case.
Advice 2: Based on the information you have provided, you are hereby authorized to replace the engine on this vehicle. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head with related components. Contact the Parts Hotline for assistance with ordering needed parts if required.

Advice 3: Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim. Thank you.

*** NOTES 01/26/2016 07:37 AM clarify Action Type: Dealer contact
*** Performed by contact: Greg Blake, 9858791990
*** This is a Request for Assistance ***

Problem Description :
customer complains that they can smell coolant and see green spots on their driveway.

Diagnostics Performed :
did inspection, found coolant all over the back side of the engine. washed off and put on pressure tester. on the front head, closest to the radiator, you can see bubbles of air and coolant coming from inbetween the head and the block, almost directly in the middle. appears to be headgasket. is this a common thing? should the head be sent out to be checked, its possible that the engine overheated as a result of so much coolant loss.

*** PHONE LOG 01/26/2016 07:51 AM Pacific Daylight Time JLancaster-TL Action Type:Web Contact
Advice 1: Please attach pictures of the coolant leak coming from the engine, also please inspect engine oil level and condition for signs of lack of maintenance, please update the case.
f the engine has overheated and coolant is leaking from the cylinder head, I recommend removing the cylinder head and inspect for a warped cylinder head and block surface using a straight edge. If the cylinder head is warped Kia does not recommend resurfacing cylinder heads and it will require replacement along with the necessary parts with DPSM approval. Please inspect and updat the case.

Advice 1: Tech states in a duplicate case:
Problem Description :
refer back to T3113157

Diagnostics Performed :
i had tech remove cylinder head, found when head gasket liner was washed out causing coolant leak...i check cylinder head for worpage (FAILED .004 an over) and black surface also (FAILED .003 An over)... also found a large amount of water in oil pan.. took pictures for record,, and saved oil sample..
Advice 2: I'm unclear as to why the DPSM declined repairs in January. You are a DSA Dealer so you aren't required to obtain approval from the DPSM or techline.

*** This is a Request for Assistance ***

Problem Description :
Customer states coolant leaking

Diagnostics Performed :
see attached pictures. Completely dry around temp control assy.,Could this be one of those plugs under exhaust manifold? Will wait till hear from you guys before I pressure wash it off.

*** PHONE LOG 02/15/2016 08:03 AM Pacific Daylight Time JLancaster-TL Action Type:Web Contact
Advice 1: I have seen a few cases on these and found a coolant leak from a bolt hole that is not used so it is an open passage. If the hole was drilled to far that will cause a leak and makes it look like a head gasket leak. I would remove the exhaust manifold on that side and think you find this is the concern. If you can not tell pressure the cooling system and recheck.
If you find this is the concern then install a plug into the threads with sealant. Then recheck by pressurizing the cooling system one more time. Let me know Thanks.

*** NOTES 02/15/2016 08:18 AM clarify Action Type: Dealer contact
*** Performed by contact: Milton Williams, 4323320441
Result of Advice 1:Will remove the exhaust manifold for further inspection.Let you know what we find...Ty Jesse!!!

*** PHONE LOG 02/22/2016 08:45 AM Pacific Daylight Time JLancaster-TL Action Type:Web Contact
Advice 1: I am unable to view the video it appears it is a screen shot of the video recording. I see the valve train and the engine appears clean, what is the leak down % of the cylinders with low compression and where are the cylinders leaking, crank case ,or valves, or possible warped head? You stated the engine needs to be replaced in the first note, does the engine make any abnormal noise when it is running? Please update the case notes and get approval to remove the cylinder head and inspect for warped cylinder head and engine block surface.

*** NOTES 03/02/2016 10:15 AM clarify Action Type: Dealer contact
*** Performed by contact: Fritz Theodore, *10052011142027
Result of Advice 1:there are no knocking noises from the engine. 30% leak to cylinder bubbles come from the radiator as well as the head gasket of B2 head gasket externally... removed the cylinder head and measured both block and head surfaces... shop manual spec head: 0.05mm actual: 0.04mm
block spec: 0.02mm actual 0.03mm..
Additional Comments:im actually suprised the head isnt worse

*** PHONE LOG 03/02/2016 10:51 AM Pacific Daylight Time JLancaster-TL Action Type:Web Contact
Advice 1: The spec for a warped head is .003. if the head is warped more than .003 I would recommend replacing the cylinder head If the block is warped or excessive the engine should be replaced with a reman engine. You are required to open a PWA case for approval to replace the engine.

pressure tested, head removed

*** PHONE LOG 03/11/2016 02:27 PM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Make sure the customer can provide proof of regular oil changes with correct filter and oil type and validate the warranty in Web DCS. If proper maintenance and warranty is validated, close this case and complete the technician satisfaction survey and open a required PWA case for PRIOR warranty authorization to replace the engine. Attach the completed and signed WRTY143 Core Data Form to the warranty case. This form must be filled out (all available sections) and signed and dated by the service manager and technician. Add a note to the case when the form is attached or the agent will not be notified. Thank you.

*** PHONE LOG 03/11/2016 02:30 PM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Correction on the last statement. Do not open a PWA warranty case. You are a self- authorizing (DSA) dealer and no PWA warranty authorization case is required. Make sure you have proof of regular oil changes with correct filter and oil type, no neglect to the engine, and a valid warranty. Be prepared to provide proof of engine damage and maintenance to the warranty department. If proper maintenance and warranty is validated, replace the engine with a long block if available; otherwise please order a short block, oil pump, and if necessary a cylinder head with related components. Contact the Parts Hotline for assistance with ordering needed parts if required.

*** PHONE LOG 04/07/2016 12:09 PM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Based on the information you have provided, you are authorized to replace the engine. Replace the engine with a long block if available; otherwise please order a short block, oil pump, and if necessary a cylinder head with related components. Contact the Parts Hotline for assistance with ordering needed parts if required. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and the valve clearance properly inspected per the service information in KGIS. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Be prepared to provide all supporting documents including photos when submitting your warranty claim. Make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and submit this operation in your warranty claim. Thank you.

*** NOTES 04/26/2016 06:26 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
*** This is a Request for Assistance ***

Problem Description :
long block was replaced due to engine overheating causing blown headgaskets.

Diagnostics Performed :
replaced long block, after running it noticed a rattle noise from bank 1, when reving from 2500 rpm on up. actuated bank 1 intake cam while reving at 2500 rpm and tones changed. bank 1 intake actual and desired are pretty far off while revving. i am attaching flight record. the first few mins is just idling and at the end i am revving engine.

*** PHONE LOG 04/26/2016 06:41 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
While the noise is present see if it stops or changes when disabling one cylinder at a time.

*** NOTES 04/26/2016 07:35 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:i cant disable the cylinders in the actuation test because the noise is only present when revving the engine. the test will not work unless vehicle is idle.

*** PHONE LOG 04/26/2016 09:00 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
I am just trying to eliminate the possibility of a problem in one of the cylinders before recommending to remove and inspect the CVVT gear. Are you able to reach cylinder number 1 coil pack ?. If so disconnect the coil pack when the noise is occurring to see if it changes or dampens.

*** NOTES 04/26/2016 11:55 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:i cannot reach the plug

*** PHONE LOG 04/26/2016 12:44 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
Can you isolate the noise to the CVVT gear area by using a stethoscope ?.

** Admin Note ***

*** Performed by contact: Matthew Meche, 3372337630
the noise is for sure comming from around that area. im pretty sure its the intake cam actuator due to the fact that the noise changes when actuating that cam. and seeing the actual and desired position so far off make me think that its aroud that area.
Additional Comments:the noise is for sure comming from around that area. im pretty sure its the intake cam actuator due to the fact that the noise changes when actuating that cam. and seeing the actual and desired position so far off make me think that its aroud that area.

*** PHONE LOG 04/27/2016 04:54 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
I agree with you I was just trying to confirm this my eliminating any other possibilities. Remove the cvvt gear and cam assembly for inspections. Make sure to check the dowel pin for damage or the hole for elongation. Check to see if the cvvt gear is locked into place. If the gear was not locked into place when installed it would cause this type of concern. Thank you

*** PHONE LOG 04/27/2016 06:24 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
I will need a clear picture of the remanufacture tag on the side of the engine for the service engineer per his request. Please attach the picture to the case per pitstop 410 and update the case once this has been done so I know the picture is attached. Thank you

*** NOTES 04/27/2016 09:21 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:I pulled the timing chain off bank one, and the intake gear moves a lil bit on the shaft compared to the exhaust gear that doesnt move at all. There shouldnt be any movent on the shaft at all correct? If so that could be the problem. The dial pin doesnt look messed up and the hole doesnt look elongated by eye.

*** PHONE LOG 04/27/2016 09:24 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
Your correct the cvvt gear should not move. Based off of this information I would like you to replace the cvvt gear and cam. Note, Matthew I still need the picture of the remanufacture tag on the engine ?.

*** NOTES 04/28/2016 11:53 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:Replaced bank 1 intake cvvt and cam shaft. still have rattling noise. i cant take a picture of the tag on the engine. it is behind the alt. and manifold.

Advice 1: Matthew,
I need a very clear picture of the metal contamination in the oil pan for review. Attach the picture to the case per pitstop 410 and make sure to update the case once this has been done. Thank you,

*** NOTES 05/05/2016 10:34 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:picture sent

*** PHONE LOG 05/05/2016 10:49 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Pictures have been forwarded to the Service Engineer.

*** PHONE LOG 05/05/2016 01:19 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
Remove the OCV valves and check for metal contamination and if found attach a picture of the OCV valve showing the metal contamination. Thank you

*** NOTES 05/05/2016 02:20 PM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:no metal contamination found in the oil control valves.

*** NOTES 05/05/2016 02:20 PM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:no metal contamination found in the oil control valves.
Additional Comments:Result of Advice 1:no metal contamination found in the oil control valves.

*** PHONE LOG 05/06/2016 10:33 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact

Advice 1: Matthew,
I am having my senior tech line agent review this case.

*** PHONE LOG 05/09/2016 04:49 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
Per the Service Engineer remove the timing case cover and inspect the guides, chain & gears for damage or abnormal wear. Thank you

*** NOTES 05/10/2016 05:54 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:found some metal shavings after removing the timing cover, but all the timing components look good, no abnormal wear.

*** PHONE LOG 05/10/2016 06:41 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
Based off of your information I recommend you parts warranty the long block to repair this vehicle. Thank you

*** NOTES 05/13/2016 11:00 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:just finished installing the parts warranty long block and it has the same exact noise as the last long block

*** PHONE LOG 05/13/2016 02:22 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Can you deturmine if the noise is in the timing cover area or the timing cover?
Remove the OCV valves and check for metal contamination and if found attach a picture of the OCV valve showing the metal contamination. Thank you

*** PHONE LOG 05/16/2016 04:40 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
Please remove the drive belt and see if the noise is still present.

*** NOTES 05/16/2016 07:50 AM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Meche, 3372337630
Result of Advice 1:no metal on the ocv's. the noise sounds like its around the bank one side of the timing cover. pretty much same as last time. i ran it with no drive belt and the noise is still there.

*** PHONE LOG 05/16/2016 08:48 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
I am escalating this case for assistance from your FTS. Make sure to have your service manager contact your dpsm for help with setting up an appointment with the FTS.
[!<For Internal Use Only
I have reviewed this case with Rob Levy and have been advised to escalate the case. This vehicle needs to be inspected by the FTS to determine what is causing the noise. >!]

Advice 1: Based on the information you have provided, you are hereby authorized to replace the engine on this vehicle. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head. If you replace any new parts on the cylinder head it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required.

Case History

*** NOTES 05/02/2016 10:11 AM clarify Action Type: Dealer contact
*** Performed by contact: Temous Frank, 2484783800
*** This is a Request for Assistance ***

Problem Description :
C/S that the vehicle has no heat and was low on coolant. They added coolant and now vehicle is hard to start.

Diagnostics Performed :
Performed MPI and found coolant was low. Observed splatter on Bank #2 converter, block and trans. No DTC's are present at this time. Filled with water, started vehicle to check for leaks. Observed leak from cyl #6 pushing out coolant from between cylinder head and block. Suggestions?

*** PHONE LOG 05/02/2016 10:24 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Temous Hello
Can you tell me if this vehicle was over heated?
Block check the engine to see if it has exhaust gasses in the cooling system.
Pressure test the cooling system, Look very carefully at the source of the leak, is it coming from the exhaust manifold bolt? or the head gasket?
Please let me know Thank you

*** NOTES 05/03/2016 11:45 AM clarify Action Type: Dealer contact
*** Performed by contact: Temous Frank, 2484783800
Result of Advice 1:The C/S his wife was driving the vehicle for the day. She had told him she was going around 40mph when the vehicle started driving funny. She continued to drive and also noticed there wasn't any heat. She told him about it when she got home. He checked the coolant and says it was low, after adding some and trying to restart the vehicle it was hard to get it started. They then decided to have it towed in for service. Their was no admission from the customer that they overheated it.
Additional Comments:Yes there are exhaust gases in the coolant and the leak is coming from the head gasket not the

exhaust manifold bolt.

*** PHONE LOG 05/03/2016 12:03 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you for that information
Are there any other signs of coolant leaking other than the head gasket? Radiator, hoses, water pump? please let me know, thanks

*** NOTES 05/05/2016 07:01 AM clarify Action Type: Dealer contact
*** Performed by contact: Temous Frank, 2484783800
Result of Advice 1:No Sir I don't see any other leaks.

*** PHONE LOG 05/05/2016 07:39 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you for that information
Please remove the cylinder heads for inspection,
Send the cylinder head out for inspection and repair,
Inspect the engine block very carefully, Check the block mating surface for warpage with a precision strait edge, Inspect all of the cylinder walls looking for any irregularity (scraping, bluing) If any are found please take a few pictures and add them to the case,
Add a case note so I will be made aware that they are there,
Please report your findings, Thank you

*** PHONE LOG 05/09/2016 07:30 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: What is the status of this case?
If vehicle is finished please close the case, And complete the survey, Thank you

*** NOTES 06/13/2016 01:46 PM clarify Action Type: Dealer contact
*** Performed by contact: Temous Frank, 2484783800
Result of Advice 1:Removed cylinder heads and sent them out to be insp. Heads were returned Okay. However, when the heads were removed one of headbolts came out with the threads still on it. This bolt is near cylinder#6 where I saw the leakage when the vehicle was running.
Additional Comments:Result of Advice 1:Removed cylinder heads and sent them out to be insp. Heads were returned Okay. However, when the heads were removed one of headbolts came out with the threads still on it. This bolt is near cylinder#6 where I saw the leakage when the vehicle was running.

*** PHONE LOG 06/13/2016 01:54 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: If the threads are pulled out of the block then the engine will need to be replaced.

Advice 2: Based on the information you have provided the engine will need to be replaced, Since your dealership is a DSA dealer PWA approval is not necessary. Please upon completion of the vehicle please close the case and complete the survey, Thank you

*** Performed by contact: Gregory Dubs, 6303553900
Result of Advice 1:There was no build up and no signs of sludge on the valve train, I have attached photos of each cylinder head and the camshafts along with the pwa form

*** PHONE LOG 05/03/2016 09:32 AM Pacific Daylight Time SCamarillo-TL Action Type:Web Contact
Advice 1: OK thanks for doing that. Please replace the engine on this vehicle. The remanufactured long block (Sub Engine) is

no longer available for 2014-2015 Sorento with the 3.3L Lambda 2 for AWD vehicles ONLY. Please order the short block, cylinder heads and any other necessary related parts. FYI. FWD long block (Sub Engine) P/N 133W1 3CS00R is still available. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Make sure to clean out all debris from any component being transferred from the failed engine.

Advice 1: Based on the information you have provided, you are authorized to replace the engine. Replace the engine with a long block if available; otherwise please order a short block, oil pump, and if necessary a cylinder head with related components. Contact the Parts Hotline for assistance with ordering needed parts if required. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and the valve clearance properly inspected per the service information in KGIS. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Be prepared to provide all supporting documents including photos when submitting your warranty claim. Make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and submit this operation in your warranty claim. If the failed engine had catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. Thank you.

Contact the Parts Hotline for assistance with ordering needed parts if required. Also be sure that you perform appropriate valve adjustment to bring lash into specification when assembling your cylinder head if cylinder head replacement on short block is necessary. If you are replacing an engine that has had a catastrophic failure such as a rod through the block, shattered piston, or large quantities of larger size debris in the oil pan, replacement of intake manifold will also be required.

*** This is a Request for Warranty Authorization ***
Branded Title: N
Warranty Valid: Y
Component Selected: ENGINE

Problem Description :
engine over heating.

Diagnostics Performed :
performed cylinder leak down test. found excessive leakage on cylinder #6. bubbles forming at radiator filler neck. removed head found faulty head gasket on bank two.

*** PHONE LOG 05/27/2016 05:53 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: PWA cases are only for obtaining approval to replace the engine. Has the vehicle been properly maintained? Is the cylinder head and block surface flatness beyond specification when checking it with a precision straight edge as outlined in the shop manual?

*** NOTES 05/27/2016 12:21 PM clarify Action Type: Dealer contact
*** Performed by contact: Eric Nicholson, *11292011113532
Result of Advice 1:block surface is within spec, but heads will need machined

*** PHONE LOG 05/27/2016 12:35 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: We do not recommend resurfacing cylinder heads. Is there any cylinder scoring or piston damage?

*** PHONE LOG 05/31/2016 07:22 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Please provide the requested information. Any repairs performed prior to obtaining approval could result in an unpaid warranty claim.
Advice 2: We do not recommend resurfacing cylinder heads. Is there any cylinder scoring or piston damage?

*** PHONE LOG 05/31/2016 12:34 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: If the requested information is not provided I will have to DENY yor request.

*** PHONE LOG 06/01/2016 05:25 AM Pacific Daylight Time dbrisky Action Type:Outgoing call
Advice 1: Called tech. Tech states that just 1 cylinder head is warped, bank 2. Tech states that the DPSM advised him to open a PWA case on any repair over $1000. Advised tech that information is not accurate. Advised techline only provides PWA for engine and automatic transmisison replacement. All other approval still go through the DPSM.

*** Performed by contact: John Harris, 7275255785
*** This is a Request for Assistance ***

Problem Description :
FOUND VEHICLE OVER HEATING, VEHICLE LEAKING FROM COOLANT PIPING ON SIDE OF BANK TWO CYLINDER HEAD, ALSO LEAKING FROM CYLINDER HEAD GASKET CHECKED OIL FOR CONTAMINATION FOUND COOLANT IN OIL.

Diagnostics Performed :
.

*** PHONE LOG 06/08/2016 06:48 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: John,
Perform a leak down test on all cylinders and list the results. While performing the test see if coolant pushes back out of the radiator on any particular cylinders.

*** NOTES 06/08/2016 07:03 AM clarify Action Type: Dealer contact
*** Performed by contact: John Harris, 7275255785
Result of Advice 1:My compression is good, performed leak down test 2-3 % across the board, no air coming up from radiator during test.

*** PHONE LOG 06/08/2016 07:36 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: John,
That was a really fast leak down test ?. The test didn't even take you 15 minute on a V6 engine.

*** NOTES 06/08/2016 08:16 AM clarify Action Type: Dealer contact
*** Performed by contact: John Harris, 7275255785
Result of Advice 1:i had already checked before you asked

*** PHONE LOG 06/08/2016 08:33 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: John,
remove all the spark plugs if not already out. Next top off the coolant and pressure test the cooling system while watching for coolant build up in any of the cylinders.

*** NOTES 06/08/2016 10:04 AM clarify Action Type: Dealer contact
*** Performed by contact: John Harris, 7275255785
Result of Advice 1:pressure checked cylinders no coolant entering cylinders, i do have coolant leaking out bank two cylinder head back side and also coolant pipe where it meets the cylinder head, vehicle has been overheated do to water inlet pipe leaking, which in turn caused cylinder head gasket to leak on outer edge warped cylinder head. I don't a misfire condition or drivability issue, i can still have a head gasket issue without it leaking in to cylinder.

*** PHONE LOG 06/08/2016 10:11 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: John,
I understand you can have a leaking head gasket without leaking into the cylinders. Based off of this information you will need to contact your dspm for authorization to replace the leaking head gasket and pipe. Make sure to thoroughly test drive the vehicle after the repair is complete to ensure there are no other problems. Thank you

*** NOTES 06/08/2016 10:17 AM clarify Action Type: Dealer contact
*** Performed by contact: John Harris, 7275255785
Result of Advice 1:so should I send cylinder out for decking?

*** PHONE LOG 06/08/2016 10:20 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: John,
It is against Kia's policy to resurface their cylinder heads or blocks. If you find the cylinder head or block to be warped you will need to replace the warped component. Please follow the shop manual on checking the cylinder head and block for warpage. Thank you

*** NOTES 06/08/2016 10:28 AM clarify Action Type: Dealer contact
*** Performed by contact: John Harris, 7275255785
Result of Advice 1:What about the coolant mixing in the oil, will cause bearing damage, or at atleast premature failure.

*** PHONE LOG 06/08/2016 10:34 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: John,
It all depends on how long the coolant was mixed in with the oil and how long the customer drove the vehicle under these conditions I have seen it cause damage and other times cause no damage at all. I would inspect the cylinder walls for damage once you have the heads off. You can even pull a couple of bearing caps off for inspection.

*** NOTES 06/09/2016 08:56 AM clarify Action Type: Dealer contact
*** Performed by contact: John Harris, 7275255785
Result of Advice 1:I emailed some pictures when taking head bolts off three of the bolts were tight and where head gasket was leaking threads came out of block.

*** PHONE LOG 06/09/2016 10:46 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: John,
I did not receive the pictures. Please attach the pictures to the case per pitstop 410. Once this has been done you will need to update the case so I am aware the pictures are there. Thank you

*** NOTES 06/09/2016 11:34 AM clarify Action Type: Dealer contact

Result of Advice 1:I added pictures.

*** PHONE LOG 06/09/2016 12:52 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: John,
Based off of the picture of the head bolt you will need to open a pwa case for warranty authorization for approval to replace the long block. Make sure to reference the tech line case in the pwa case. Thank you
Advice 2: Make sure you have proof of regular oil changes with correct filter and oil type and a valid warranty. Be prepared to provide proof of engine damage and maintenance to the warranty department. Open a required PWA for approval to replace the engine and update and close this case. Please review the warranty bulletin 2015-09 (sent to your dealer) and attach the completed and signed WRTY143 Core Data Form to the PWA case or the warranty process will be delayed. Note, THERE IS A UPDATED WTY143 FORM NOW ON KGIS. This form MUST have the box checked located just above the Service managers signature. Thank you.

Diagnostics Performed :
ref T 3199931

*** PHONE LOG 06/09/2016 01:08 PM Pacific Daylight Time GPhillips-TL Action Type:Web Contact
Advice 1: John, I have reviewed your assistance case. If you have verified the customer's service records, verified that there is no build up in the engine or other signs of neglect, the engine has not sustained any external impact and the warranty is still valid according to Web DCS, please refer to warranty bulletin 2015-09 and attach the core data sheet WRTY143. It will need to be filled out, signed by both you and your service manager (no electronic signatures or stamps), dated and attached to this PWA case before it can be approved. Please add a note to the case once it is attached so that I know it is there.

If you have not been able to validate all required services, remove the valve cover and attach at least one clear photo of the valve train to the case. Add a note so I know it is there.

Make sure you are using the newest core data form. A new version of the WRTY143 was released in April. Older Versions will no longer be accepted. You can find the newest version on Kdealer under Fixed ops, Warranty, Forms.

*** PHONE LOG 06/09/2016 01:52 PM Pacific Daylight Time GPhillips-TL Action Type:Web Contact
Advice 1: John, based on the information you have provided, you are hereby authorized to replace the engine on this vehicle. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head with related components. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Make sure valve lash is checked before final assembly. Contact the Parts Hotline for assistance with ordering needed parts if required. Be prepared to provide all supporting documents (maintenance records, etc.), including photos, when submitting your warranty claim. Make sure you clean any and all metal debris from any parts transferred from the failed engine and submit this operation with your warranty claim. If the failed engine has catastrophic damage (rod through the block, large metal debris in the pan, or seized), please replace the intake manifold as well. If the engine is equipped with a turbo, please be sure to also inspect the turbo and oil feed line for metal debris, build up or damage and replace the turbo and oil feed line if necessary. Thank you.

Problem Description :
vehicle running real rough at idle

Diagnostics Performed :
found coolant low in radiator and none in the reservoir
added coolant to reservoir and radiator which added up to be a quart low
cranked engine to warm up to notice that there are air bubbles coming up intermittently. the bubbles are tiny in size so if there is an issue with head gasket then its very small but still a concern and could be the cause of the rough idle
scanned for codes to not find any in system
checked for coolant leaks to find none present
attempted to perform an combustion leak test but I guess my fluid is old or there isn't enough exhaust gasses being pushed through system to turn colors

*** PHONE LOG 06/21/2016 09:13 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Patrick,
Please warm up the vehicle completely than perform a cylinder lead down test and list the results. While you have the spark plugs out check to see if they look like they have any greenish color to them. Thank you

*** NOTES 06/22/2016 07:38 AM clarify Action Type: Dealer contact
*** Performed by contact: Patrick Dell, 9856419595
Result of Advice 1:all plugs don't appear to have any distinct impressions of coolant in cylinders
used bore scope to inspect cylinders to find all pistons but 1 to have clean spots with no carbon build up by valve indentions in pistons
used leak down tester with engine cold to find cylinders holding pressure

*** PHONE LOG 06/22/2016 08:07 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact

Problem Description :
C/s while driving engine overheating

Diagnostics Performed :
Coolant level low added coolant pressure tested system found external leaks at Bank one cylinder head front corner, not sure if there is any internal engine damage due to customer continued to drive while overheated.

*** PHONE LOG 08/06/2016 07:33 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Hello Tony
Are there any signs that the engine was severely over heated?

*** NOTES 08/06/2016 07:58 AM clarify Action Type: Dealer contact
*** Performed by contact: Tony Difranco, 2163983000
Result of Advice 1:engine does not smell over heated talked to cust. says he only drove a short diastance

*** PHONE LOG 08/06/2016 08:25 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you for that information
The cylinder head will need to be removed for inspection, But when the valve cover is removed and you have access to the head bolts try re torque them down to see if the threads in the block are stripped out. Please report your findings

*** PHONE LOG 08/10/2016 12:02 PM Pacific Daylight Time TThomas-TL Action Type:Incoming call
Advice 1: Tony called in. Head gasket leaking along the back of the head. Advised to pull the valve cover and check the head

bolt torque for loose bolts. If they spin it will need the engine replaced. If they are tight, pull the head for inspection.

** Admin Note ***
ervice alert escalated to CA as : K3250567 on 08/10/2016

*** PHONE LOG 08/11/2016 06:56 AM Pacific Daylight Time FLusic-TL Action Type:Incoming call
Advice 1: Tony called in and said that the block is stripped out, I told him that the engine will need to be replaced and they are a DSA dealer and PWA is not necessary
He also asked if a long block should be used since there was metal in the engine, I said that a long block should be used if available

*** PHONE LOG 08/16/2016 09:57 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: What is the status of this case?
If vehicle is finished please close the case, And complete the survey, Thank you

*** NOTES 08/17/2016 01:02 PM clarify Action Type: Dealer contact
*** Performed by contact: Tony Difranco, 2163983000
Result of Advice 1:replaced short block assy.

Case History

*** NOTES 08/09/2016 02:34 PM clarify Action Type: Dealer contact
*** Performed by contact: Zac Sidebottom,
*** This is a Request for Assistance ***

Problem Description :
C/S the vehicle started running poor, when checked the temp gauge was reading in the hot position. Coolant leaking from vehicle.

Diagnostics Performed :
Confirmed leak, rough run. Found radiator empty, smelling of combustion gases. Checked dipstick, found milky oil. Checked oil fill cap and severe coolant-oil contamination present under cap and in valve cover. Found misfire for cylinder #2, checked plug and found to be steam cleaned from boiling coolant, piston top shows same.

*** PHONE LOG 08/09/2016 02:47 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Hello Zac
Do you know where the original coolant leak was and or what caused the over heating?

*** NOTES 08/09/2016 02:52 PM clarify Action Type: Dealer contact
*** Performed by contact: Zac Sidebottom,
Result of Advice 1:The customer states they were coming from Idaho (vehicle has Idaho state plates) and they noticed the temperature gauge in the overheating range. We did not see any leaks aside from the cap where the cap was unseated from the radiator. The pressure bottle hose that comes from the radiator was blown off from the excessive pressure in the cooling system.

*** PHONE LOG 08/09/2016 03:00 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you for that information
The radiator cap was loose then the vehicle came into the dealership?

*** NOTES 08/09/2016 03:10 PM clarify Action Type: Dealer contact
*** Performed by contact: Zac Sidebottom,
Result of Advice 1:Yes and the coolant bottle hose that attaches to the radiator was blown off, there is evidence of catastrophic cooling system pressure in the engine compartment. There is coolant residue all across the engine compartment.

*** PHONE LOG 08/09/2016 03:16 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you for that information
Please remove the cylinder heads to inspect the engine for internal damage
Look for warpage of the block and heads
Inspect for cracks in the heads and block
Check for cylinder wall damage, If you do find damage please take pictures of the damage and attach them to the case and then add a case note so I will be made aware that they are there, Thank you

*** NOTES 08/10/2016 04:15 PM clarify Action Type: Dealer contact
*** Performed by contact: Zac Sidebottom,
Result of Advice 1:Tore engine down to inspect for cause of damage.

Removed engine and transaxle assembly to inspect. Pulled valve covers, took pictures of contaminated oil in engine. Upon taking head bolts off, bank 1 was very tight, head fully seated against block. Bank 2, 4 of the 8 head bolts were very loose, when bolts were pulled, they pulled the threads from the engine block itself. Head was not seated tightly to block. Bank 1 gasket was in good condition, no signs of leakage or warpage. Bank 2 head gasket was in poor condition, warped and showed signs of leakage at the exhaust side, external and internal leak traces found on head. Checked head for warpage, found bank 2 has over .003" warpage across the #2 and #4 cylinder and bank 1 has just under .002" warpage across the surface. Both cylinder heads exceed warpage limits and need to be replaced.
Additional Comments:I have pictures throughout the tear down process of coolant contaminated oil, external leak residue, cylinder head bolt thread damage, head gasket failures, steam cleaned pistons of cylinders 2, 4, and 6, and various other portions. What pictures do you need to see?

*** PHONE LOG 08/11/2016 07:23 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you Zac for the thorough work, Based on that information, The threads are pulled out of the block the engine will need to be replaced
Advice 2: Based on the information that you have provided the engine will need to be replaced
You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form to the case with both the service manager and technician signatures on it. Thanks
Please close this case and open a PWA case and complete the survey,

Please get all the needed information such as proof of oil changes, pictures, and if the vehicle is under warranty and you are required to open a Separate Tech line Engine PWA Case in order to gain approval to replace the engine prior to replacing the engine. Please refer to Warranty Bulletin 2015-09 for further information on this policy. Please refer to this case number in the PWA case notes. Thanks. Make sure to attach the core data sheet that is filled out as much as possible and signed by the tech and service manager to the PWA case. Thanks.

Warranty Valid: Y
Component Selected: ENGINE

Problem Description :
C/S The vehicle started running poor, when checked the temp gauge was pegged at the hot side. Coolant leaking out of the vehicle. Check and advise.

Diagnostics Performed :
Confirmed concern, found radiator cap blown off, hose to coolant over flow bottle blown off. Oil was milky in consistency. Tore engine down to point of failure, head gaskets had failed, head on bank 2 was warped beyond service specifications, head bolts were pulling threads out of the block from the warping force of the head. I have approx. 40 photos documenting the damage and tear down procedures.

*** PHONE LOG 08/15/2016 07:45 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Please attach the completed and signed WRTY143 Core Data Form to the case. The form must be filled out (all available sections) and signed and dated by the service manager and technician. Make sure to check the box at the bottom of the form stating that the dealer has validated the appropriate maintenance has been completed. Add a note to the case when the form is attached. We are not notified of attachments. Thank you.

*** PHONE LOG 08/17/2016 07:30 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: I have received your completed and signed WRTY143 engine core data form which you have checked the verification box certifying that appropriate maintenance has been completed in accordance with the owner's manual. Based on the information you have provided, you are authorized to replace the engine. Replace the engine with a long block if available; otherwise please order a short block, oil pump, and if necessary a cylinder head with related components. Contact the Parts Hotline for assistance with ordering needed parts if required. When replacing the short block, inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and the valve clearance properly inspected per the service information in KGIS. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Be prepared to provide all supporting documents including photos when submitting your warranty claim. Make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and submit this operation in your warranty claim. If the failed engine had catastrophic damage, (rod through block; large metal debris in the pan; or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. Thank you.

Result of Advice 1:REVISED PWA ATTACHED,
Result of Advice 2:the head and block was straight edge and check for specs. it was within specs. no resurfacing was done.

*** PHONE LOG 09/13/2016 01:29 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: We have received your completed and signed WRTY143 engine core data form in which you have checked the maintenance records verification box certifying that all maintenance in accordance with the Kia maintenance schedule has been performed on the vehicle. Based on the information provided to us in this form and in this case, you are hereby authorized to replace the engine on this vehicle.
Advice 2: Since the head was being replaced, please order a short block and oil pump. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Make sure to clean out all debris from any component being transferred from the failed engine. If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one . Thanks.

*** NOTES 09/15/2016 12:45 PM clarify Action Type: Dealer contact
*** Performed by contact: Matthew Fila, 9088508200
*** This is a Request for Assistance ***

Problem Description :
Customer presented vehicle with failed thermostat. Found exhaust gas in coolant. Determine head gasket failure was the source. Upon replacing the head gaskets 5/8 of the cylinder head bolts (right side) were not very tight- able to be removed by a 3/8 air ratchet. Upon reassembly the bolts that were loose pulled the threads out of the block on the final torquing sequence.

Diagnostics Performed :
I tried a time-sert kit, but the threads are recessed approx. 2.5 inches into the block and my time-serts cannot reach that deep. Do you have a special kit available or should I replace the short block assembly?

*** PHONE LOG 09/15/2016 12:56 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Matthew,
If this vehicle is still under drive train warranty you will need to replace the engine to correctly repair this failure.
Advice 2: Based off of your information you will need to open a pwa case for warranty authorization for approval to replace the engine. Follow the listed information.

Advice 3: Make sure you have proof of regular oil changes with correct filter and oil type and a valid warranty. Be prepared to provide proof of engine damage and maintenance to the warranty department. Open a required PWA for approval to replace the engine and update and close this case. Please review the warranty bulletin 2015-09 (sent to your dealer) and attach the completed and signed WRTY143 Core Data Form to the PWA case or the warranty process will be delayed. Note, THERE IS A UPDATED WTY143 FORM NOW ON KGIS. This form MUST have the box checked located just above the Service managers signature. Thank you.

*** PHONE LOG 11/08/2016 06:22 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: In a duplicate case the tech stated: Problem Description :
Customer states vehicle keep using coolant

Diagnostics Performed :
this is the 4th time vehicle has been in for this, this is the first time I got it. this is the tech line case from the other tech T3278218. I cant find any external leaks yet. dye is in cooling system, still have not found any thing, wanted to get tech line started while I keep going with my diag, let me know if you have any thoughts, I will add notes as I go.

Advice 2: Please pressure test the cooling system for at least 30 mins and note if there is any pressure lost and any signs of a leak. Please also check the radiator cap and look for signs of coolant residue on all hoses and outlets.
Advice 3: If you can not find an external leak, please run the vehicle so it gets to normal operating temp and make sure the cooling fan turns on and off as designed. Then being careful not to get burned since the cooling system will be pressurized, remove the radiator cap, pressurize the cooling system, and remove all spark plugs. Then let the vehicle cold soak and after the engine is completely cold inspect all the cylinders with a bore scope for signs or coolant in them and check for signs of coolant in the oil as well. Let me know what you find. Thanks.

*** Performed by contact: Jorge Hofbauer, 7813956800
*** This is a Request for Assistance ***

Problem Description :
Customer states that vehicle is overheating

Diagnostics Performed :
Started by checking coolant level and cooling fan operation, the fan is operating as per design and found that coolant is low. Did the cooling system pressure test and did not find any leaks.
Next I checked the coolant reservoir and found that the inside of the reservoir smells very strongly like exhaust fumes. So I proceeded to take all spark plugs off and found with a bore scope that the top of the pistons are full of dried coolant, so I determined that the cylinder head gaskets must be blown. Engine seems to have some sludge in it. Please advise, thanks a lot

*** PHONE LOG 09/19/2016 08:32 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jorge,
Please perform a cylinder leak down test per technician basics TB009. Make sure to have the radiator cap removed when performing the test to see if coolant pushes back out of the filler neck. I would like to know if both cylinder heads of blown gaskets or just one. I would also like a picture of the excessive build up in the cylinder heads. Please attach the picture to the case per pitstop 410 and once this has been done please update the case indicating the picture is there.

*** NOTES 09/20/2016 03:44 AM clarify Action Type: Dealer contact
*** Performed by contact: Jorge Hofbauer, 7813956800
Result of Advice 1:I did the cylinder leak down test, and found that cylinders 1,5,2,4 have a leak of over 15%. Did see very small bubbles coming out of the radiator filler neck. I also attached pictures of the burned coolant on top of the pistons. Please advise, thanks a lot

*** PHONE LOG 09/20/2016 04:55 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jorge,
Based off of this information I recommend to request authorization to remove the cylinder heads for inspection to see if they warped or if the cylinder block is warped. If either component is found to be warped it will need to be replaced. Kia does not allow for there cylinder heads to be resurfaced. Thank you

*** NOTES 09/27/2016 12:28 PM clarify Action Type: Dealer contact
*** Performed by contact: Jorge Hofbauer, 7813956800
Result of Advice 1:I was taking the motor apart, and found some coolant and oil where the cylinder heads meets the engine block. It feels like the head gasket is able to move easily. The oil and coolant accumulated a little bit in the area underneath the injectors. Should I continue to take everything else apart? Please advise, thanks a lot

*** PHONE LOG 09/27/2016 01:18 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jorge,
Yes you should continue to remove the cylinder heads for inspection. Check to see if the cylinder heads or block are warped per the shop manual. Check for any loose head bolts or stripped out bolt holes.

*** NOTES 09/28/2016 11:47 AM clarify Action Type: Dealer contact
*** Performed by contact: Jorge Hofbauer, 7813956800
Result of Advice 1:Found loose head bolts on both cylinder heads. Please advise, thanks

*** PHONE LOG 09/28/2016 12:34 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jorge,
Continue with removing the cylinders heads for inspection. After the cylinders heads are removed and inspected check to see if the head bolt holes in the block are damaged or stripped out.

*** NOTES 09/30/2016 04:31 AM clarify Action Type: Dealer contact
*** Performed by contact: Jorge Hofbauer, 7813956800
Result of Advice 1:It does not look like the head bolt holes are stripped or damaged. There is a lot of damage in the cylinder head gaskets. Found that the heads seem to be warped. I am assuming that there is damage on the engine block. Again, aa lot of the head bolts were loose. Please advise, thanks a lot

*** PHONE LOG 09/30/2016 05:29 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jorge,
Per the shop manual I need to know the exact reading of the inspection procedure. Use a straight edge and check to see if the cylinder head or block are warped.

*** NOTES 10/07/2016 04:54 AM clarify Action Type: Dealer contact
*** Performed by contact: Jorge Hofbauer, 7813956800
Result of Advice 1:We used a straight edge, and determined that the heads do not seem to be warped, but again, there was damage done to the head gaskets because of loose head bolts. Please advise, thanks a lot.

*** PHONE LOG 10/07/2016 05:43 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jorge,
Did you check the deck of the block for warpage ?.

*** NOTES 10/07/2016 09:59 AM clarify Action Type: Dealer contact
*** Performed by contact: Jorge Hofbauer, 7813956800
Result of Advice 1:I did check the deck of the block and also double checked the heads and the deck, and did not find any signs of warpage. Please advise, thanks a lot

*** PHONE LOG 10/07/2016 10:03 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jorge,
I recommend to replace the head gasket and head bolts on this vehicle than recheck for proper operation. Thank you

*** NOTES 11/01/2016 08:24 AM clarify Action Type: Dealer contact
*** Performed by contact: Jorge Hofbauer, 7813956800
Result of Advice 1:I just attached a picture of the threads from the engine block that came out when trying to put the cylinder head bolt in. After I did the cylinder head bolts tightening sequences noticed that some of the bolts would not tighten. So I decided to take out the bolts that would not tighten and on some of them the threads came out with the bolt. When I had done the initial inspection after taking the cylinder heads out I did not see any signs that this would happen. This is probably what caused the bolts to get loose and therefore the head gaskets were allowing the engine to burn coolant. I think the engine should be replaced. Please advise on what to do next, thanks a lot

*** PHONE LOG 11/01/2016 08:40 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Based off of your information you will need to open a pwa case for warranty authorization for approval to replace the engine. Follow the listed information.

Advice 1: I have received your completed and signed WRTY143 engine core data form which you have checked the verification box certifying that appropriate maintenance has been completed in accordance with the owner's manual. Based on the information you have provided, you are authorized to replace the engine. Replace the engine with a long block if available; otherwise please order a short block, oil pump, and if necessary a cylinder head with related components. Contact the Parts Hotline for assistance with ordering needed parts if required. When replacing the short block, inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and the valve clearance properly inspected per the service information in KGIS. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes

and on the back of your repair order. Be prepared to provide all supporting documents including photos when submitting your warranty claim. Make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and submit this operation in your warranty claim. If the failed engine had catastrophic damage, (rod through block; large metal debris in the pan; or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. Thank you.

Result of Advice 1:thanks also another issue I ran into is the 122 degrees then 92 degrees accurate because I got to 45 degrees on the 92 degrees step and no the bolt wont budge. never had this issue in the past and im only one in the shop that does short blocks just checking before I proceed
Result of Advice 2:na
Additional Comments:na

*** PHONE LOG 10/01/2016 08:07 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Ben called and stated he did lubricate the bolts and wanted to make sure the torque was correct. When the bolts

were streched 45 degrees after the initial torque he found it stripped the threads in the block. I advised I have not had any reports of the torque being incorrect and he is sure that the torque wrench used initially was calibrated correctly and the initial torque was correct. I double checked the torque spec for the 2015 year and found it was almost identical. Advised the spec should be accurate. Advised if the threads in the block were damaged, then my recommendation is to replace the block, head bolts, head gasket, and other components as needed with DPSM approval.

*** This is a Request for Assistance ***

Problem Description :
just replaced short block due to overheating concern. the head bolt threads were warped on previous short block. I installed motor into vehicle and when testing it I noticed it was misfiring randomly and when given gas it stumbles and cuts off but runs fine at idle. I made sure everything was plugged in correctly. I have not check timing of timing chain yet wasn't sure if that would cause a crankshaft code. fly wheel is bolted up correctly

Diagnostics Performed :
scanned with kds and found codes p0300, p0019, p0018, p0302, p0304. replaced crankshaft position sensor and noticed no change

*** PHONE LOG 10/17/2016 06:18 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Benjamin, all the DTCs are related to bank 2. There are misfires on all the bank 2 cylinders and cam correlation codes for both bank 2 camshafts.
Advice 2: Please check the engine timing and make sure bank 2 camshafts are not one or more teeth off. Let me know what you find. Thanks.

*** NOTES 10/17/2016 06:47 AM clarify Action Type: Dealer contact
*** Performed by contact: Benjamin Patrick, 8044313838
Result of Advice 1:n/a
Result of Advice 2:rechecked my timing marks on bank 2 and found it is in time. had 2 other techs verify.

*** PHONE LOG 10/17/2016 07:26 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: If the valve cover is installed already, clear the code and do an all data flight recording while duplicating the concern

if possible for a minimum of 10 minutes per Tech Times article, volume 11 issue 5 and attach the flight recording to the tech line case as per PS410. Add a note when it has been attached because I do not get a notification. If you do not clear the code before taking the flight recording the PCM may display modeled data and not the actual cam position. If possible clear the code with the KOEO and then take the vehicle for a short test drive and capture a recording with the start up and test drive. Thanks.

Advice 2: If the valve cover is off please set the engine to TDC then turn the engine back slightly and note if there is any slack in the timing chain.

I found timing was less than a tooth off, I put vehicle all back together now I have coolant leak from o ring behind timing cover for water pump. I know this is a different concern but I was wondering if I could replace that without pulling off timing cover. wasn't sure if I could gain access under intake manifold or not
Additional Comments:I found timing was less than a tooth off, I put vehicle all back together now I have coolant leak from o ring behind timing cover for water pump. I know this is a different concern but I was wondering if I could replace that without pulling off timing cover. wasn't sure if I could gain access under intake manifold or not

*** PHONE LOG 10/18/2016 08:49 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Benjamin,
I would think you will have to remove the intake manifold to reach the cooling pipe to be able to replace the O- ring.

*** RESEARCH LOG 10/24/2016 05:05 AM Pacific Daylight Time TThomas-TL Action Type:Administrative task
In a duplicate case, Benjamin Patrick reported: replaced short block assembly and released vehicle in proper working condition with no leaks. customer comes back 3 days later complaining of oil leaking under car and it appears to be coming from the rear main seal. is there anything that could cause the same appearance, because that was new with the short block assembly.

Diagnostics Performed :
found no leaks anywhere on motor just in bell housing

*** PHONE LOG 10/24/2016 05:07 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Benjamin. We need to keep this together with the Reman engine concern RA case. Add dye to the oil and run the engine until the dye is visible in the leaking oil. Remove the transmission and inspect for the location of the leak.

*** PHONE LOG 11/01/2016 09:10 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Please provide the repair status of this vehicle. If you require further assistance, please add a case note with all pertinent information or call (800) 494-4542.

*** NOTES 11/02/2016 10:38 AM clarify Action Type: Dealer contact
*** Performed by contact: Benjamin Patrick, 8044313838
Result of Advice 1:found torque convertor seal to be cause of leak. I found it bent so I replaced. car came back 2 days later with trans fluid leaking. when pulling off torque convertor seal came off with it. I replaced seal for the second time and on test drive seal gave out. I have not yet pulled trans out but what could cause these seals to go bad. I didn't notice anything bent or broken other than the thin brass sleeve behind seal a small piece is missing from that

*** PHONE LOG 11/02/2016 11:22 AM Pacific Daylight Time BLall-TL Action Type:Incoming call
Advice 1: Benjamin called and let me know after the engine replacement the vehicle worked as designed then the customer returned with a fluid leak concern and he found the front converter seal to be leaking. He replaced the seal and released the vehicle then 2 days later the vehicle returned leaking from the converter seal again. Advised based on the information he provided, my recommendation is to replace the transmission after getting authorization. Advised he will need to open a

separate transmission PWA case for approval.

*** PHONE LOG 11/02/2016 11:23 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Ben, sorry I did not realize you are a DSA dealer, you do not need a PWA case you can just replace the transmission. Thanks.

*** PHONE LOG 10/25/2016 12:21 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Problem Description :
THE ENGINE HAS A COOLANT LEAK THAT CAN BE SEEN COMING OUT OF THE CYLINDER HEAD FRONT CYLINDER

ON THE BLOCK. THE HEADGASKET HAS BEEN CHANGED AT ANOTHER DEALER ABOUT A YEAR AGO. I HAVE ATTACHED A PICTURE OF A BLACK PIECE OF PLASTIC THAT IS WEDGED IN BETWEEN THE CYLINDER LINER AND THE BLOCK WEB CASTING. AS YOU CAN SEE FROM THE PICTURE IT APPEARS AS THOUGH THE PLASTIC PIECE SHOULD BE OVER A LITTLE IN THE V NOTCH GROOVE AND MAYBE THAT WOULD ALLOW IT TO SIT DOWN A LITTLE FURTHER. THE PLASTIC PIECE IS UP HIGHER THAN THE BLOCK DECK AND I AM SUMMIZING THAT THIS IS CAUSING A SEALING PROBLEM WITH THE HEADGASKET AND THE 2 MATING SURFACES. PLEASE ADVISE AS TO WHAT THIS PIECE IS , WHY IT IS THERE AND SHOULD I TRY AND RELOCATE IT?
THANKS FOR YOUR HELP.

Diagnostics Performed :
REMOVED THE CYLINDER HEAD TO IDENTIFY THE SOURCE OF THE HEADGASKET FAILURE AS STATED ABOVE.

*** PHONE LOG 10/25/2016 12:21 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jeffrey,
Add the pictures to this case. Thanks.

*** PHONE LOG 10/25/2016 12:25 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Jeffrey,
The piece appears to be a coolant restrictor. This piece should not be sticking out preventing the cylinder head from matting correctly to the engine block.
Advice 2: Jeffrey can you push the piece down further into the block ?.

*** NOTES 10/27/2016 07:29 AM clarify Action Type: Dealer contact
*** Performed by contact: Christopher Medina, 8454627700
Result of Advice 1:Hello im updating this case..We were able to take the restrictor out and reposition in correct spot in "v" groove. Reinstalled cylinder head. When torqueing head bolts we found multiple block threads to be stripped not allowing for proper torque We did notice when removing cylinder head all but two head bolts were loose..
Result of Advice 2:yes we repositioned

*** PHONE LOG 10/27/2016 07:40 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Based off of your information you will need to open a pwa case for warranty authorization for approval to replace the engine. Follow the listed information.

Advice 2: Make sure you have proof of regular oil changes with correct filter and oil type and a valid warranty. Be prepared to provide proof of engine damage and maintenance to the warranty department. Open a required PWA for approval to replace the engine and update and close this case. Please review the warranty bulletin 2015-09 (sent to your dealer) and attach the completed and signed WRTY143 Core Data Form to the PWA case or the warranty process will be delayed. Note, THERE IS A UPDATED WTY143 FORM NOW ON KGIS. This form MUST have the box checked located just above the Service managers signature. Thank you.

Result of Advice 1:CONFIRMED HEAD BOLT LOOSE, ENGINE BLOCK THREADS STRIPPED

*** PHONE LOG 11/10/2016 09:49 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.

Advice 2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

Advice 1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly
- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components (this is a separate operation in the warranty claim).
- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Problem Description :
Customer states that car is overheating and has a coolant leak

Diagnostics Performed :
Verified customer concern with overheating. Performed inspection and found coolant in oil, leak coming from head gasket area between cylinder head and block. Performed chemical head gasket test and vehicle failed. No visible damage to engine or cooling system and cooling fans come on when commanded. I pressurized cooling system and could not verify leak.

Advice 1: Hello Joel
Please remove the valve cover on the bank that is leaking and attempt to re torque all of the head bolts to see if any of the threads in the block are stripped out, Please report your findings

*** NOTES 11/16/2016 01:58 PM clarify Action Type: Dealer contact
*** Performed by contact: Joel Gonzales, 5592946300
Result of Advice 1:Head bolts holes are stripped out and not holding torque

*** PHONE LOG 11/16/2016 02:17 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you for that information

Based on the information that you have provided the engine will need to be replaced.
Please check to see if this engine is not a used or junk yard motor, and you have verified there are no signs of neglect, the engine has not sustained any external impact

You are now required to open a separate PWA case to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY 143 Core Data Form to the case with both the service manager and technician signatures on it. Thanks
Please close this case and open a PWA case and complete the survey,

Problem Description :
Customer states there is an oil leak

Diagnostics Performed :
First: history. Replaced long engine due to low compression. New long engine leaked fuel on startup. found fuel rail pressure sensor not tightened. fuel rail comes preassembled on long blocks... next engine had a coolant leak. fixed coolant leak at water crossover manifold (again, preassembled on long engines). Vehicle returned again with an oil leak. Found rear valve cover leaking, upon disassembly found valve cover gasket not in retainer groove. Now on to this concern... customer returned with an oil leak. Upon inspection, found oil leaking from both front and rear cylinder head gaskets, externally. Proven with oil dye. Both leaks are at lower rear corner of cylinder head, and it is not due to oil pressure sender or valve covers. How do we proceed with this problem?

Customer states vehicle overheated and leaks coolant

Diagnostics Performed :
Performed engine inspection, performed chemical head gasket test-headgasket failed, pressure test - leak coming from headgasket area between head and block. Retorqued head bolts and bolt hole are stripped.

*** PHONE LOG 11/17/2016 08:15 AM Pacific Daylight Time GPhillips-TL Action Type:Web Contact
Advice 1: Joel, if you have verified the customer's service records, verified that there is no build up in the engine or other signs of neglect, the engine has not sustained any external impact, it is not a used or junk yard motor, and the warranty is still valid according to Web DCS, please refer to warranty bulletin 2015-09 and attach the core data sheet WRTY143. It will need to be filled out, signed by both you and your service manager (no electronic signatures or stamps), dated and attached to this PWA case before it can be approved. Please add a note to the case once it is attached so that I know it is there. Be sure you are using the latest core data sheet. It was updated again on 11-1-16 and can be found under kdealer, fixed ops, warranty forms.

If you have not been able to validate proper maintenance, remove the valve cover and attach at least one clear photo of the valve train to the case. Add a note so I know it is there.

Result of Advice 1:pwa attached

*** PHONE LOG 11/17/2016 08:40 AM Pacific Daylight Time GPhillips-TL Action Type:Web Contact
Advice 1: Joel, Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components (this is a separate operation in the warranty claim). If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component. Be sure to check the turbo and oil feed line as well, if equipped.

- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

*** Performed by contact: Brian Nordby, 9372371000
*** This is a Request for Assistance ***

Problem Description :
3 weeks ago this car was in for no heat and I found it was low on coolant and overheating from a thermostat housing gasket leaking which I replaced. Now the car is doing the same thing after the customer added another 3/4 of a gallon of coolant.

Diagnostics Performed :
It appears the right head gasket is leaking externally. There is a trail all along the bottom of the head and a large dry greenish brown streak leading down the middle of the block from the head. Should I remove both heads to check for overheating damage or just inspect the one leaking?

*** PHONE LOG 12/09/2016 10:50 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Brian, please take pictures showing the coolant residue you found. Please also pressure test the cooling system and if possible take a picture showing the source of the leak when coolant is coming out.
Advice 2: Please check the head bolts in the area of the leak to find out if they are loose or if they are torqued as designed. Let me know what you find. Thanks.

*** NOTES 12/16/2016 01:56 PM clarify Action Type: Dealer contact
*** Performed by contact: Brian Nordby, 9372371000
Result of Advice 1:Attached pictures of the head gasket residue. Wasn't possible to see leak during pressure test.
Result of Advice 2:Removed both cylinder heads. Found the middle 4 head bolts very loose requiring no effort on both heads. The outer bolts on the right head were not very tight either. One of the middle bolts in the right head pulled the threads out of the block, picture attached. Both heads were warped when measuring with straight edge.
Additional Comments:Coolant droplets were found in the oil pan. Also attached picture of where the thermostat housing was to show how much coolant sprayed out from overheating. I don't trust the integrity of the thermostat housing since this is the 2nd time its proven to be a weak spot from the pressure of overheating.

*** PHONE LOG 12/16/2016 02:07 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Thanks for the information and the pictures. Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.

Advice 2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

*** This is a Request for Assistance ***

Problem Description :
THE ENGINE HAS OVERHEATED AND BARELY RUNS.

Diagnostics Performed :
THE VEHICLE IS LEAKING COOLANT FROM THE REAR LEFT CORNER OF THE BANK 2 HEAD GASKET. #6 CYLINDER IS FULL OF COOLANT AND OIL. THERE IS COOLANT AND OIL THROUGHOUT THE ENGINE BAY. NO OTHER LEAK COULD BE IDENTIFIED AND COOLING FAN CAN BE TURNED ON IN ACTUATION TEST. WHEN PRESSURIZING COOLING SYSTEM A STREAM OF WATER COMES FROM HEAD GASKET. I BELIEVE THIS WILL NEED A LONG BLOCK DUE TO OVERHEATING. NO OTHER SOURCE COULD BE FOUND TO CAUSE OVERHEATING.

*** PHONE LOG 12/12/2016 02:28 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Aaron,
I recommend to remove the cylinder head for inspection. Check to see if the cylinder head or block is warped per the shop manual guide lines. Thank you and please keep me up to date on the progress of the repair.

*** NOTES 12/13/2016 11:53 AM clarify Action Type: Dealer contact
*** Performed by contact: Aaron Wright, *08302010102019
Result of Advice 1:removed the cylinder heads. the head gasket is broken in the area of the cooling jacket around cylinder #6. the bank 2 cylinder head is also cracked in the same area around #6. bank 2 cylinder block surface is warped measuring .076mm. the head bolts for bank 2 took very little effort to remove as if they were not torqued correctly. removed the bank 1 cylinder head and head surface is flat measuring .038mm. the block surface for bank 1 is also .038mm.
Additional Comments:vehicle will need either a long block or a short block and new bank 2 cylinder head

*** PHONE LOG 12/13/2016 12:52 PM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Aaron,
Based off of your information I recommend to replace the engine. Thank you
Advice 2: · Replace the engine with a long block, if available; otherwise, please order a short block assembly

· If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

· If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

*** This is a Request for Warranty Authorization ***
Branded Title: N
Warranty Valid: Y
Component Selected: ENGINE

Problem Description :
Engine overheating.

Diagnostics Performed :
Found right head gasket leaking. Both cylinder heads were warped, and the head bolt threads were pulled out of the block with one of the right head bolts. Advised to replace engine per techline #T3342002

*** PHONE LOG 12/19/2016 05:52 AM Pacific Daylight Time TThomas-TL Action Type:Web Contact
Advice 1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly.
- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required.
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission).
- Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components (this is a separate operation in the warranty claim).
- If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.
- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do

not use the original intake manifold; replace the intake manifold with a NEW one.
Make sure all ladder frame bolts are installed in the replacement short engine, if applicable.

Case History

*** NOTES 12/19/2016 01:04 PM clarify Action Type: Dealer contact
*** Performed by contact: Cameron Harris, 9103501650
*** This is a Request for Assistance ***

Problem Description :
Towed in from independent shop. Running rough, externally leaking coolant and has a lot of coolant in the oil, visible coolant/oil mixture in valve cover. There is slight seepage and one minor leak appearing to come from the bank 1 headgasket. Do I need to proceed further to determine which gasket is leaking or replace both headgaskets and send heads for pressure testing/cleaning?

Diagnostics Performed :
No codes, but runs very rough at first start and under load.
Coolant in oil.
Did injector kill test to see if one cylinder was dropping out due to coolant contamination or low compression, all equally lowered idle RPM.

*** PHONE LOG 12/19/2016 01:19 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Hello Cameron
In My opinion both cylinder heads need to be removed for inspection but you will need to contact your DPSM for approval to remove the head that is not leaking

*** NOTES 12/28/2016 04:57 AM clarify Action Type: Dealer contact
*** Performed by contact: Cameron Harris, 9103501650
Result of Advice 1:just to update, the parts to replace 1 headgasket should be here this week. After I moved the vehicle at the end of last week it was actually spraying coolant from the corner of the front (bank 2) head. DPSM and service manager both agreed that I should remove that head and while the intake is off, perform a combustion chamber leak down test on the Bank 1.

*** PHONE LOG 12/28/2016 06:50 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you for the update
Please be sure to check to see if the threads in the block are not pulled out for the head bolts

*** NOTES 12/30/2016 02:17 PM clarify Action Type: Dealer contact
*** Performed by contact: Cameron Harris, 9103501650
Result of Advice 1:Head bolts closest to front were very very tight, almost breaking tools tight, and the four rearward most bolts were lose enough to break free with a 3/8 drive ratchet. The rear left bolt pulled about 1" of threads out of the block. All others appear to be clean.

*** PHONE LOG 12/30/2016 02:31 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Thank you for that information
Based on the information you have provided the engine will need to be replaced, Since your dealership is a DSA dealer PWA approval is not necessary. Upon completion of the vehicle please close the case and complete the survey, Thank you

** Admin Note ***
ervice alert escalated to CA as : K3356146 on 12/30/2016

Advice 1: Hello Todd
We will need to properly diagnosed the engine to see if the whole engine needs to be replaced, Here are the things that I would like you to check
1, Please check to see if the threads for the head bolts are pulled out on that bank, remove the valve cover and cams then attempt to re tuque the head bolts to see if this is possible if any of the bolts pull the threads out of the block let Me know, If this is okay then
2, Remove that head and then inspect the cylinder walls for damage or discoloration, If you do find some please take a few pictures and attach them to the case, If this is okay then
3, Using a dial indicator you will need to check all of the pistons to see if any do not travel all the way to the top of the cylinder as the rest of the pistons, This will tell us that the rod on that cylinder may be bent, Please report on all of these items and be

detailed in your answers

Advice 1:

Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

· Replace the engine with a long block, if available; otherwise, please order a short block assembly

· If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

· If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

· Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. (this is a separate operation in the warranty claim). If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

· If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

· The turbo charger and oil feed line should be replaced also if there is metal in the engine (if applicable),

· Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

Result of Advice 1:Removed valve cover. Check head bolts a leakage point. Unable to torque head bolts. Damaged threads in block.

*** PHONE LOG 12/28/2016 12:43 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.

Advice 2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

ervice alert escalated to CA as : K3355591 on 12/29/2016

*** PHONE LOG 12/30/2016 06:05 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Mike, if you let the vehicle cold soak can you verify that the thermostat is opening as designed?
Advice 2: Does the engine ever run hot?
Advice 3: With the engine hot then again after a cold soak, pressurize the cooling system and note if the pressure drops or if you find any leaks. Let me know what you find. Thanks.

*** PHONE LOG 12/30/2016 12:57 PM Pacific Daylight Time BLall-TL Action Type:Incoming call
Advice 1: Mike called to discuss the case and stated previously there was only a thin film of oil found in the cooling system. Advised to do the cooling system pressure test with the engine off to find out if there is an internal or external cooling system leak. Advised if there is no leak to do an engine flush adding a mild degreaser such as dawn or shout so it will break down any oil or grease and to retest. The vehicle never runs hot and the concern is only at idle. Advised if the concern continues to replace the thermostat as the most likely cause of a restriction in the cooling system.

*** PHONE LOG 01/03/2017 07:20 AM Pacific Daylight Time BLall-TL Action Type:Incoming call
Advice 1: Mike called and stated when pressure testing the system no leak down could be found but there is bubbling in the radiator still and nothing abnormal showed up on a block test. He isolated the transmission cooler and checked for any signs of leaking and there is not and there is good flow through it. Mike found there is no longer any oil in the cooling system but there is still bubbling in the coolant. After continuous testing he found coolant leaking on between the head and block on bank 2. He has a picture of the concern. Advised to attach the picture to the case and to add a note when it is attached or I will not be notified. Advised since he verified a leak between the head and block to remove the valve cover and to check all the head bolts to make sure they are tightened as designed and that none are loose indicating the threads in the block have been damaged.

*** PHONE LOG 01/03/2017 11:44 AM Pacific Daylight Time JPhillips-TL Action Type:Incoming call
Advice 1: Tech called in and stated that he had pulled the cam cover to check the breakaway torque on the head bolts where the exterior leak was found. The head bolts had almost no breakaway torque, and the threads are pulled. Advised that he would need to replace the engine in this vehicle. Please refer to warranty bulletin 2015-09. You are required to open a techline engine PWA for request of authorization prior to ordering any parts, or performing any repairs. Please be sure to complete, and attach your WRTY143 core data sheet to the PWA case.

*** NOTES 12/30/2016 12:00 PM clarify Action Type: Dealer contact
*** Performed by contact: David Richardson, 7709528881
*** This is a Request for Assistance ***

Problem Description :
Customer complains of check engine light on and no heat.

Diagnostics Performed :
Brought vehicle in and verified lack of heat. Checked codes and found P0300 P0303 and P0305. Vehicle did exhibit a slight misfire on start up. Removed radiator cap and no coolant was present but did have a hydrocarbon type smoke come out. Performed a block test and the result was negative. I have attached a photo of the test vial. I have concluded that it has a blown head gasket.

*** PHONE LOG 12/30/2016 12:29 PM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: David, verify there is no external damage to the engine/cooling system caused by an impact with a road hazard or neglect Verify the engine has been maintained properly and should be covered under warranty. If okay, perform a compression test and leakdown test before you remove the cylinder heads and check for head and block flatness, if out of specs Kia does not recommend resurfacing and replacment will be necessary.

*** NOTES 01/06/2017 10:16 AM clarify Action Type: Dealer contact
*** Performed by contact: David Richardson, 7709528881
Result of Advice 1:Ok. I have the heads off and they most certainly are warped. You can throw a cat under my straight edge. The block however is ok. There is no external damage. The only thing I would question id if there is any ring damage due to heat.

*** PHONE LOG 01/06/2017 10:31 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: David, what were your compression readings and leakdown results?

*** NOTES 01/06/2017 10:38 AM clarify Action Type: Dealer contact
*** Performed by contact: David Richardson, 7709528881
Result of Advice 1:I guess I forgot to tell you those. compression was 155+ on all cylinders except 3 and 5. 3 was 120 and 5 was 115. On the leak down 3 and 5 were 62%. The rest were under 10%.

*** PHONE LOG 01/06/2017 10:58 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: David, unless you see an issue with the cylinder walls, based on the information provided we will have to reuse the block and replace the heads.

*** NOTES 01/06/2017 10:59 AM clarify Action Type: Dealer contact
*** Performed by contact: David Richardson, 7709528881
Result of Advice 1:OK I'll get them ordered

*** RESEARCH LOG 01/06/2017 12:24 PM Pacific Daylight Time SOkimura Action Type:Administrative task
Keep me posted

*** NOTES 01/16/2017 02:40 PM clarify Action Type: Dealer contact
*** Performed by contact: David Richardson, 7709528881
Result of Advice 1:Got heads back from machine shop and began installing the first head. Torqued sequence one to 30 ft lbs. Began to proceed with the 118 to 122 degree pull the VERY FIRST head bolt pulled all the threads out of the block about 1/2 way through the pull.

*** PHONE LOG 01/17/2017 06:23 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Based on the information provided the engine block should be replaced. Close this assistance case and open a separate TL PWA Case to gain authorization for engine replacement approval PRIOR to replacement, attach the revised Engine core data sheet to the case (form WRTY143) dated 11-1-2016 and reference this techline case number in your notes. Information for this process can be found in Warranty Bulletin 2016-22.

*** NOTES 01/17/2017 06:37 AM clarify Action Type: Dealer contact
*** Performed by contact: David Richardson, 7709528881
Result of Advice 1:Do you want to put in a short or long block. We have already built a new set of heads.

*** PHONE LOG 01/17/2017 06:41 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: David, since the heads are new and ready replace the short block. Thanks

*** PHONE LOG 01/03/2017 01:51 PM Pacific Daylight Time JLancaster-TL Action Type:Web Contact
Advice 1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly
- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any

cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check ion to do so.valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. (this is a separate operation in the warranty claim). If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

- Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

*** Performed by contact: Christopher Blair, 8035095555
*** This is a Request for Assistance ***

Problem Description :
Customer states they have to keep adding water

Diagnostics Performed :
The coolant over flow tank is mixed with oil and coolant, there is a strong oil smell coming from the radiator. Toped off the radiator and saw exhaust gases coming from the radiator.

*** PHONE LOG 01/16/2017 01:56 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: To verify there a blown head gasket or damage to the engine, please perform a block check or perform a cylinder leak down test on all cylinders and note the percentage of leak down and note where the air is escaping from during the test (radiator, intake, exhaust, another cylinder, or crankcase) and inspect the spark plugs
Advice 2: Are there any external cooling system leaks that can be found by pressure checking the system? Does the fan work as designed? Does the thermostat open and close as designed?

*** NOTES 01/17/2017 09:46 AM clarify Action Type: Dealer contact
*** Performed by contact: Christopher Blair, 8035095555
Result of Advice 1:Cylinder 1 is at 20%, cyl 2 is at 10%, cyl 3 is at 100%, cyl 4 is at 20%, cyl 5 is at 15%, and cyl 6 is at 17%
Result of Advice 2:I did a pressure test and was unable to see any external coolant leaks.

*** PHONE LOG 01/17/2017 12:44 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Please note where the air wasescaping from during the test (radiator, intake, exhaust, another cylinder, or crankcase) for each cylinder. Thanks.

*** NOTES 01/17/2017 12:51 PM clarify Action Type: Dealer contact
*** Performed by contact: Christopher Blair, 8035095555
Result of Advice 1:I heard it coming from the intake

*** PHONE LOG 01/17/2017 01:58 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Are you sure that each cylinder was on TDC of the correct stroke when you did the leak down test? Your testing indicates an issue but not a blown head gasket. Please re-do the leak down test with the assistance of a senior tech if needed and report the results again. Thanks.

*** NOTES 01/17/2017 02:13 PM clarify Action Type: Dealer contact
*** Performed by contact: Christopher Blair, 8035095555
Result of Advice 1:I did have every cylinder at TDC. I am a senior tech and I am fully certified. When ever I crank it over and run it exhaust gases come out of the radiator, and oil is actively mixing with the coolant. I also did a block test on the coolant system and the test indicated that there was exhaust gases present in the coolant system.
Additional Comments:please tell how this is not a blown head gasket thanks have a nice day

*** PHONE LOG 01/18/2017 07:59 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Chris, I did not want to offend you I have to go based on the information you provide in the case and when you opened the case all the indications such as the exhaust pressure in the cooling system and the oil/coolant mixing indicates a blown head gasket or crack in the head or block but the leak down test results did not support that so I have to question it. There was also no mention of the block test until your previous notes even though in my advice on 1/16 I stated to do a block check or cylinder leak down check. I just need to make sure the concern is documented and supported in the notes clearly.
Advice 2: Thanks for clarifying for me. Based on the information you provided, my recommendation is to contact your DPSM for authorization to remove the head and to inspect the head and block for warpage or damage and to replace the head gasket and any other damaged components found. Please make sure to inspect the valves on cylinder 3 since there was 100% leak down through the intake during the leak down test.

*** NOTES 01/26/2017 08:49 AM clarify Action Type: Dealer contact
*** Performed by contact: Christopher Blair, 8035095555
Result of Advice 1:took the heads off found two loose head bolts on the left bank on cylinder number 6, which caused the head gasket to blow.
Result of Advice 2:head and block good sent head to get pressure tested.

*** PHONE LOG 01/26/2017 09:45 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Chris, since you found two of the head bolts were loose I suspect the threads in the block are damaged where those bolts were. Please check the threads and make sure that they will hold torque when the bolts are tightened. Let me know what you find. Thanks.

*** NOTES 01/27/2017 05:16 AM clarify Action Type: Dealer contact
*** Performed by contact: Christopher Blair, 8035095555
Result of Advice 1:When I was doing the torque I was doing the 1st angle and some of the head bolts broke free of the block on the right side
Additional Comments:Do you want me to get a short blocks or long block to fix this issue

*** PHONE LOG 01/27/2017 07:55 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL. Please replace the long block if one is available unless the heads have already been checked and rebuilt. Make sure the heads are not resurfaced at all, if they are warped they should be replaced.

Advice 2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it. Based on the information

provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

*** PHONE LOG 02/08/2017 02:41 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Please provide the repair status of this vehicle. If you require further assistance, please add a case note with all pertinent information or call (800) 494-4542.

*** Performed by contact: Peter Tauber, *01172012161530
*** This is a Request for Assistance ***

Problem Description :
2015 sorento came in for an over heat condition. No codes in it, fans are working, thermostat isn't stuck, it was low on coolant tho. I saw that one of the nipples on the water housing was leaking so I replaced the nipple and rechecked.

Found at that point that it has at least a blown head gasket on bank 2. When I start it with the coolant funnel filled up it shoots the coolant out everywhere.

Performed a compression test and found that all cylinders had 190-195 compression except for cylinder 2 which had 240 due to coolant in the cylinder. It's a pretty significant leak. When performing the test it was shooting coolant out of the spark plug tube.

Before I pull the cylinder head to measure, is there anything you would like me to check first? Please advise, thanks

Diagnostics Performed :
inspected for leaks, fan and thermostat operation, performed compression test

*** PHONE LOG 01/30/2017 07:00 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Peter, do you feel that there is enough coolant in the cylinder that it may have caused the rod to bend or other damage? Please drain the coolant and do another compression test on cylinder 2. Thanks.

*** NOTES 01/30/2017 08:46 AM clarify Action Type: Dealer contact
*** Performed by contact: Peter Tauber, *01172012161530
Result of Advice 1:It's hard to say, compression came in at 180-185 psi once the coolant was drained.

I took it for a short test drive on Friday and on initial start up it ran rough. After it ran for a little bit it evened out. It didn't set any codes, and it didn't over heat for me, but I also filled the system before I drove it. Thanks

*** NOTES 01/30/2017 08:48 AM clarify Action Type: Dealer contact
*** Performed by contact: Peter Tauber, *01172012161530
Result of Advice 1:Also, there is liquid coolant in cylinder 2 it's not just damp or anything. Thanks

*** PHONE LOG 01/30/2017 09:51 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Please contact your DPSM for authorization to remove the head and inspect for warpage or damage. If you find that any of the head bolts are loose stop and check if they will tighten to spec or if there is damage to the threads in the block, and let me know. Thanks.

*** NOTES 02/01/2017 07:06 AM clarify Action Type: Dealer contact
*** Performed by contact: Peter Tauber, *01172012161530
Result of Advice 1:I found the two head bolts flanking cylinder 2 on the exhaust side were loose. One of which was loose enough I could turn by hand and would not tighten. The other started to tighten then began to spin freely.

The other head bolts were tight, some more than others. The threads came out of the block completely on the one bolt, the other had damage but not as bad.

I measured the cylinder head and found it was ok except for in the area of the loose bolts where I was able to slide a 0.001 in gauge under my straight edge. Thanks

*** PHONE LOG 02/01/2017 07:45 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Based on the information you provided, my recommendation is to replace the engine. You are at a self-authorizing dealer so no PWA case is required; just verify the warranty is valid. Thanks.

*** PHONE LOG 02/24/2017 10:40 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Please provide the repair status of this vehicle. If you require further assistance, please add a case note with all pertinent information or call (800) 494-4542.

*** NOTES 02/28/2017 04:35 AM clarify Action Type: Dealer contact
*** Performed by contact: Peter Tauber, *01172012161530
Result of Advice 1:It's going back together now. No long block was available so we got a short block and sent the heads out to the machine shop for reconditioning. I will let you know once it's all done. Thanks

*** RESEARCH LOG 02/28/2017 07:36 AM Pacific Daylight Time BLall-TL Action Type:Administrative task

*** Performed by contact: Mark Novak, 4124661466
*** This is a Request for Assistance ***

Problem Description :
no heat , boils over, this vehicle was here about 2000 miles ago tech 126 says he topped off the coolant, that 1000, miles ago tech 246 say air was trapped in the system for the same trouble,

Diagnostics Performed :
I received this jem, and found the low hose would not get hot to the touch while the cooling fans where running. at this time I used my combustion leak detector, and didn't find any trace of hydrocarbons. today the thermostat arrived and I installed it, as I started the vehicle I noticed that, there was a discharge, of gas as I started the vehicle cold. I quickly installed my leak dector and found a small trace of gases, in the system, the color of the fluid just turned slightly yellow,(from Blue), at this point there still is little to no heat, and the lower hose still takes a long time to get hot, and the is a rapid build of pressure, I would call head gaskets , but this engine makes a loud timing chain type noise when it starts all the time and is a quart low on oil at this point, with no leaks. I would like to know what direction to pursue, I think if we do head work at this point there still may be an engine issue , later from the sounds of the engine , I will take some movies and send them.

*** PHONE LOG 02/07/2017 06:51 AM Pacific Daylight Time dbrisky Action Type:Outgoing call
Advice 1: Any signs that the vehicle has ever been in a collision or have any coolant leaks? Does it appear that the vehicle has been properly maintained? Any signs of metal in the oil?

*** NOTES 02/07/2017 07:23 AM clarify Action Type: Dealer contact
*** Performed by contact: Mark Novak, 4124661466
Result of Advice 1:No accident's, no leaks, , I see three oil changes on my history report I have, I just think this no heat issue has escalated over the pass until present.
Additional Comments: No metal in the oil, no pcm engine codes

*** PHONE LOG 02/07/2017 07:43 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Remove the valve cover, take a picture of the valve train and attach it to the case for review.

*** NOTES 02/07/2017 07:49 AM clarify Action Type: Dealer contact
*** Performed by contact: Mark Novak, 4124661466
Result of Advice 1:ok got the movie to go through, watch at the end
Additional Comments:we goose the throttle and pressure kicks the leak detector out

*** PHONE LOG 02/07/2017 07:54 AM Pacific Daylight Time dbrisky Action Type:Outgoing call
Advice 1: Thanks, but i'm trying tio determine if we can remove the cylinder heads and replace the timing components or if this will need a long block. Perform a cylinder leak down test and report what cylinders causes air bubbles in the filler neck.

Result of Advice 1:Will do leak down next

*** RESEARCH LOG 02/07/2017 08:42 AM Pacific Daylight Time dbrisky Action Type:Administrative task
Thanks for the update

*** NOTES 02/07/2017 10:26 AM clarify Action Type: Dealer contact
*** Performed by contact: Mark Novak, 4124661466
Result of Advice 1:ok , I ran the leak down test and all cylinder's are at about 20% leakage, which still leaves them in the green on the gauge, the compression is 135-140 on all cylinder's.
I also went and applied pressure to the system and cranked over the motor, when 16 psi is applied, when you start cranking it drops to about 13 than stabilizes, That's a new one to me , on coolant coming from cylinders.
Additional Comments: the air you here on the leak down sounds like it is coming from the crank case, and lower intake on most cylinder's. the pictures I took indicate that the cylinder walls are scoring and the top of the valves are rally gunked up. I think there my be some warp age or a crack somewhere that is not showing up at this point. but with the noise and cylinders walls , what is the call?

*** PHONE LOG 02/07/2017 10:30 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Based on the information provided I'm recommending a long block.
Advice 2: • You are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it. Thanks
• Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

Advice 1: What is the status of this vehicle? If the vehicle is no longer present or has been repaired then please update the case and close it. Thanks.

*** NOTES 02/23/2017 03:31 AM clarify Action Type: Dealer contact
*** Performed by contact: Mark Novak, 4124661466
Result of Advice 1:I just Finished the repair yesterday, took until Monday to receive the short block.
Additional Comments:what I found, Beside the massive carbon type of build up around the vales, which is most likely breaking off and helping scorn the cylinder walls, which were bad, a timing chain tensioners was broken it would not hold current position,(no Lock).
 the head bank most forward of the vehicle had loose head bolts!!, and the first Cylinder there , was leaking compression, you could tell from the gasket, I wish I had time to send some picks. I have seen this same carbon type of build up on everything, BMW mini copper recommends high octane fuel, because of such a condition.

Result of Advice 1:wrty143 attached

*** PHONE LOG 02/22/2017 08:57 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1:
Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

· Replace the engine with a long block, if available; otherwise, please order a short block assembly

· If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

· If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

· Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. (this is a separate operation in the warranty claim). If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

· If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

· The turbo charger and oil feed line should be replaced also if there is metal in the engine (if applicable),

· Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

Problem Description :
Customer states HVAC system blows cold, intermittently blows warm but mostly cold.

Diagnostics Performed :
Check coolant level, reservoir full. Remove radiator cap fluid up to top. Road test vehicle to check condition. After vehicle reached operating temperature found that vehicle had heat when driving but not at idle. Rechecked coolant level and found reservoir level now over full mark. Remove radiator cap and found a large amount of pressurized air escaping from system. Also found coolant had escaped from reservoir overflow spout during road test, but vehicle did not over heat. No DTC's found. Cooling fans and thermostat cycling normally. Performed cooling system pressure test, system appears to be holding pressure at this time.

*** PHONE LOG 03/06/2017 07:55 AM Pacific Daylight Time BLall-TL Action Type:Web Contact

Advice 1: Robert, your testing indicates there is a restriction in the coolant flow. Based on the information you provided, my recommendation is to get authorization to remove the thermostat and to test it in hot water as per the shop manual. Note if it is opening fully, partially, or not at all. Thanks.

Advice 1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

· Replace the engine with a long block, if available; otherwise, please order a short block assembly

· If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

· If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

· Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. (this is a separate operation in the warranty claim). If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

· If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

· Make sure all the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you

Advice 1: Hello Dan
Please attach a sound recording to the case
Advice 2: Pictures of the valve train or legitimate and complete service records are required!

A picture of the engine serial number is also required!

If you have not done so already, Please remove the valve cover and take a few pictures of the COMPLETE valve train area and attach them to the case . Then add a case note so I will be made aware that they are there.

Please review, PS 410. Adding Data and Images to tech line web cases, Thank you

ONLY IF THERE IS ANY INDICATION that there is lack of maintenance (oil jell) in the engine then,

Please obtain the service records from the customer, Then attach them to the case and add a case note to the file so I will be made aware that they are there, Thank you

Result of Advice 1:I have sent the pictures

*** PHONE LOG 03/22/2017 11:49 AM Pacific Daylight Time JBrookes Action Type:Web Contact
Advice 1: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be

transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

· If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.
· If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.
· Make sure all ladder frame bolts are installed in the replacement short engine, if applicable.
· All collateral damage is covered by the drivetrain warranty and needs to be thoroughly documented on the repair order and in the warranty claim stating the reason for the replacement. Supporting documentation will be required at the time of warranty claim submission.
Warranty cases are closed for approval and you will no longer be able to access this case. Please call in if further assistance is needed.

*** Performed by contact: Carl Criscuoli, 9088508200
Result of Advice 1:I checked the head for warpage as per kgis and it was with in spec. and no it has not been resurfaced

*** PHONE LOG 03/27/2017 01:17 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.

Advice 2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the

WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

*** Performed by contact: Daniel Vincek, 2523783600
*** This is a Request for Assistance ***

Problem Description :
customer states engine overheated and could see coolant dripping on the ground

Diagnostics Performed :
inspected, check engine light on with p0306 stored. Cooling system approx 1 gallon low. Removed cylinder 6 spark plug, pressurized system, coolant leaking into cylinder 6. Trying to see if there are any other leaks at the moment that caused the headgasket to blow. The top of the transmission is covered in coolant, aswell as the engine. I did use borescope to check under the intake for coolant,did not see any coming from the pipe under the intake.

**** PHONE LOG 03/29/2017 07:09:36 AM JBrookes
Advice 1: Daniel, asthe head gasket has blownm it would be wise to remove the cylinder head and check for flatness with a good accurate straight edge, and check the deck of the block too thanks .

**** NOTES 03/29/2017 07:16:36 AM clarify Action Type:Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:will get to work and update when i have it removed

**** NOTES 03/29/2017 10:01:29 AM clarify Action Type:Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:Got the head removed. None of the head bolts were tight. I was able to loosen all with very little effort.
Additional Comments:I will attach a few pictures of the valve covers. Water was mixed with the oil badly

**** NOTES 03/29/2017 10:20:58 AM clarify Action Type:Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:Inspecting the cylinder block for flatness, it is within specs. A .002 feeler gauge will not fit through.
Additional Comments:Cylinder head inspection. I am able to put a .004 inch feeler gauge all the way around cylinder 6, and

can fit the .002 which is spec, at cylinder 4 aswell.

**** PHONE LOG 03/29/2017 10:29:54 AM JBrookes
Advice 1: Thanks, what we find is that when engine has been overheated as you reported this engine did overheat generally the head needs replacing, have the head checked for cracks that perhaps are not seen .

**** NOTES 03/29/2017 10:48:21 AM clarify Action Type:Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:Next question would be, the exhaust manifold for that bank, is full of coolant. Would this need to go ahead and replace?

**** PHONE LOG 03/29/2017 10:50:41 AM JBrookes
Advice 1: Cannot the coolant be drained out or otherwise removed from the exhaust manofold ?

**** NOTES 03/29/2017 11:00:47 AM clarify Action Type:Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:it can, but have seen that much coolant in a cat before, cause the cat to fail soon down the road.

**** PHONE LOG 03/29/2017 11:10:54 AM JBrookes
Advice 1: That being the case the Catalytic converto should be replaced .

**** NOTES 03/30/2017 04:46:51 AM clarify Action Type:Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:service manage was doing some calculations, and with the price of replacing the head with labor would be just under putting a enging long block in the vehicle.
Additional Comments:So his question is why not just put a long block in the vehicle, and eliminate the risk of further engine troubles down the road from where it overheated?

**** PHONE LOG 03/30/2017 07:24:34 AM JBrookes
Advice 1: What is the condition of the cylinder bores ? please take pictures showing clearly the condition thanks.

**** NOTES 03/30/2017 07:56:58 AM clarify Action Type:Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:the cylinder bores look pretty good, no scaring. will post some pictures here in a few minuets

**** NOTES 03/30/2017 09:51:37 AM clarify Action Type:Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:Picture added

**** PHONE LOG 03/30/2017 09:52:53 AM JBrookes
Advice 1: Only the picture of the valv covers was able to be seen the other one will not open due to errors in transmitting .

*** NOTES 04/03/2017 12:51 PM clarify Action Type: Dealer contact
*** Performed by contact: Daniel Vincek, 2523783600
Result of Advice 1:Attached another

*** PHONE LOG 04/03/2017 01:57 PM Pacific Daylight Time JBrookes Action Type:Web Contact
Advice 1: Daniel the two pictures of cylinder borse did not look bad in the pictures. This is DSA dealer and to replace the engine, if that is what is needed, a techline PWA is not required, refer to warranty bulletin 2016-22, thanks Daniel.

*** This is a Request for Assistance ***

Problem Description :
VEHICLE ENGINE OVERHEATING WHEN DRIVING FOR ATLEAST 20 MNUTES OF DRIVING, THEN COMING TO STOP.

Diagnostics Performed :
CHECKED COOLANT LEVEL, REPLACED THERMOSTAT, NO LEAKS.

*** PHONE LOG 04/03/2017 05:10 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Mike, please check for a headgasket leak and cooling fan operation. Thank you

*** NOTES 04/03/2017 10:18 AM clarify Action Type: Dealer contact
*** Performed by contact: Mike Hammer, 3524789162
Result of Advice 1:No headgasket leak, fan is working properly, coolant is full.

*** PHONE LOG 04/03/2017 11:05 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Mike, just to be clear, is the engine still overheating? If yes, Check if the cooling fan is blowing in the correct direction and no restricted airflow across the radiator. Make sure gauge is accurate and engine is actually overheating.

*** NOTES 04/03/2017 12:27 PM clarify Action Type: Dealer contact
*** Performed by contact: Mike Hammer, 3524789162
Result of Advice 1:Yes the engine is overheating after driving for a while. Checked temperature with current data, its at 135/140 and going up. Checked airflow of fan and air is going in the correct direction with no blockage of air flow.

*** PHONE LOG 04/03/2017 12:55 PM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Mike, it appears there was a radiator and possible headgasket repairs done under warranty, can you verify what work has been performed at your dealer.
When the engine is overheating, check with a temp gun to see if the temp sensor is accurate.

Did you perform a cylinder leakdown test watching for bubbles or a rise in level at the filler neck? Have you performed a block test?

** Admin Note ***
ervice alert escalated to CA as : K3426127 on 04/03/2017

Yes repairs were performed here. Started car cold with radiator cap off, let run could see small bubbles coming from filler neck as car warmed up. After car warmed up, turned off , top hose hot, bottom hose is cold. Did not boil over. Re started car with cap off and coolant blew out of filler neck very high.
Additional Comments:Yes repairs were performed here. Started car cold with radiator cap off, let run could see small bubbles coming from filler neck as car warmed up. After car warmed up, turned off , top hose hot, bottom hose is cold. Did not boil over. Re started car with cap off and coolant blew out of filler neck very high.

*** PHONE LOG 04/05/2017 04:55 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Mike, what repairs were perform on this vehicle? Was the cylinder head gaskets replaced, were the heads resurfaced and checked for cracks?

*** NOTES 04/05/2017 11:21 AM clarify Action Type: Dealer contact
*** Performed by contact: Mike Hammer, 3524789162
Result of Advice 1:BACK WHEN JACNUARY 2015, VEHICLE CAME IN WITH 14000 MILES, REPLACED BOTH HEAD GASKETS AND SENT BOTH CYLINDER HEADS TO REPUTABLE MACHINE SHOP TO HAVE CHECKED. HAD THEM RESURFACED AND MACHINED TO OEM SPECS TO PASS ALL VACUUM TESTS.

*** PHONE LOG 04/05/2017 12:00 PM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Mike, Kia does not recommend resurfacing heads, the head will require replacement. Remove the heads and measure the block for flatness. I found the previous techline case and it was noted the rear head center head bolts were loose. Please check for any loose bolts and thread damage. Thank you

*** NOTES 04/10/2017 06:00 AM clarify Action Type: Dealer contact
*** Performed by contact: Mike Hammer, 3524789162
Result of Advice 1:All disassembled, check block for straight, rear of block warped
Additional Comments:Advise please. Thanks.

*** PHONE LOG 04/10/2017 06:19 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Based on the information you have provided, please replace the engine following normal service procedures. Since you are a DSA dealer a PWA case is not necessary.

Please note:

- Replace the engine with a long block if available; otherwise, please order a short block assembly
- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any

cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

· Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

· If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

· The Turbo and oil feed line should be replaced if sludge or metal debris are found.

· Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

Case Title: MIL - PCM # P0420

Symptom: Warning Light On **DTC:** P0420

System: Emission Control

Component: Catalytic Converter

Resolution:

Case History

*** NOTES 04/03/2017 10:47 AM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
*** This is a Request for Assistance ***

Problem Description :
check engine light on for p0420

Diagnostics Performed :
vehicle came in with check engine light for p0420. performed tsb eng160. vehicle was returned to customer and 450 mile returned with same dtc and same signs as in the tsb to replace the manifold.

*** PHONE LOG 04/03/2017 11:01 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Please verify that the fuel is not contaminated or have a high alcohol content.
Advice 2: In engine current data, are there any misfires or klnock adaptations present?

*** NOTES 04/03/2017 12:22 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:removed old gas and placed new gas in the fuel tank
Result of Advice 2:looked at current data and found no misfires and no knock adaption. was off

*** PHONE LOG 04/03/2017 12:24 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Sounds like either the bad gas or failed engine damaged the pre cat. I recommend that you replace it.

*** NOTES 04/03/2017 12:32 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:bank 1 exhaust manifold was replaced already. in accordance to tsb eng160.

*** PHONE LOG 04/03/2017 12:35 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Was it replaced, before or after the engine failed? How long was the bad gas in the vehicle?

*** NOTES 04/03/2017 01:03 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:manifold was replaced after short block was done. and the gas that was in it was there for 2 weeks

*** NOTES 04/03/2017 01:07 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:short block was done 10/16

*** PHONE LOG 04/03/2017 02:39 PM Pacific Daylight Time CSchang-TL Action Type:Incoming call
Advice 1: Tech called in.
Tech states that fuel that had previously sat and may have been high alcohol content fuel was run through the new Catalytic converter. Tech also states the adaptive values were not reset. Tech is advised at this time to take a fuel sample and perform a high alcohol content test and reset the adaptives and continue to monitor the O2 sensor values.

** Admin Note ***
ervice alert escalated to CA as : K3426163 on 04/03/2017

*** PHONE LOG 04/04/2017 04:00 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Looking back over the case I realize that ENG 160 is for the 2.4L. Did you perform a PCM upgrade that didn't apply to this vehicle? What is the ROm ID?

*** NOTES 04/04/2017 06:45 AM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:no the ecu upgrade that was performed was a logic performance one that was found in the system. by the kds. it was for mil light on with no dtc.

*** PHONE LOG 04/04/2017 06:48 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: What is the PCM part number and ROM ID?

*** NOTES 04/04/2017 07:51 AM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:Added a photo of the pcm

*** PHONE LOG 04/04/2017 07:57 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: ROM ID?

*** NOTES 04/04/2017 08:57 AM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:Added screens hot

*** PHONE LOG 04/04/2017 09:05 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Thank you. Please capture the concern on a 10 minute all data flight recording and atatch it to the case for review.

*** PHONE LOG 04/04/2017 10:11 AM Pacific Daylight Time JLancaster-TL Action Type:Web Contact
Advice 1: Tech called and I assisted him with the instruction on how to attach the KDS file recording to the tech line case as

outlined in the KDS /GDS Attaching files to techline case found on KGIS under the quick links tab.

*** NOTES 04/04/2017 10:16 AM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:Added flight record

*** NOTES 04/04/2017 10:44 AM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:where u able to see the flight recording

*** PHONE LOG 04/04/2017 11:10 AM Pacific Daylight Time dbrisky Action Type:Outgoing call
Advice 1: You only recorded O2 sensor data, I asked for all data.

*** NOTES 04/04/2017 11:22 AM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:ok

*** PHONE LOG 04/04/2017 11:29 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Let me know when the recording is attached and ready for review.

*** NOTES 04/04/2017 11:59 AM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:Added new flight recording

*** PHONE LOG 04/04/2017 12:02 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Doesn't look like you drove it or duplicated the concern, Idles the entitre time.

*** NOTES 04/04/2017 12:31 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:the vehicle was idle at temp. the front bank sensor will go radical on its own when in flight record mode unable to see current data for me to see what o2 sensor doing. the one o2 sensor shows how was going

*** NOTES 04/04/2017 12:32 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:added it

*** PHONE LOG 04/04/2017 12:37 PM Pacific Daylight Time dbrisky Action Type:Outgoing call
Advice 1: I'm trying to determine why the pre cat has failed again, they typically don't fail for no reason. PLEASE TEST DRIVE THE VEHICLE AND CAPTURE 10 MINUTES OF ALL DATA AND ATTACH IT TO THE CASE FOR REVIEW.

*** NOTES 04/04/2017 01:44 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:Added test drive data to tech case

*** PHONE LOG 04/04/2017 02:51 PM Pacific Daylight Time DFinkelstein-TL Action Type:Incoming call
Advice 1: Tech called in. The vehicle has recoded a P0420 code . Tech stated he replaced the Bank 2 precat (radiator side) last visit Advised tech bank one is the firewall side not radiator. Advised him to replace the bank one firewall precat. Then test

drive vehicle and see if the P0420 returns.

*** PHONE LOG 04/05/2017 04:15 AM Pacific Daylight Time dbrisky Action Type:Outgoing call
Advice 1: I see some differences between actual vs desired cam timing of more than 3 degrees as well as knock adaptations taking place. Is there any metal in the oil?

*** NOTES 04/12/2017 12:29 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:none that i can see without dropping pan oil was brown with very little shine with flash light

*** PHONE LOG 04/12/2017 12:35 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Can you drain the oil through a paint strainer or coffee filter?

*** NOTES 04/12/2017 12:41 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:don't have anything to do that and oil was dumped out

*** PHONE LOG 04/12/2017 12:45 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: I checked your KU credentials and it appears that you have not been with Kia for very long. Do you have a shop foreman that can assist you?
Advice 2: We can't just install ANOTHER pre cat with out determining root cause.

*** NOTES 04/12/2017 12:52 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:i'm the only kia certified tech at this shop. this is a ford/kia dealership. all other techs are ford and have may be one or 2 classes of kia

Result of Advice 2:ok

*** PHONE LOG 04/12/2017 12:54 PM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: I'm escalating the case due to the number of days down, the number of repair attempts and not making any progress towards a repair. An FTS should contact you with in 24 hours

*** NOTES 04/12/2017 12:56 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:customer takes vehicle home due to living hr from dealership

*** RESEARCH LOG 04/12/2017 12:59 PM Pacific Daylight Time dbrisky Action Type:Administrative task
Thanks for the update

*** NOTES 04/12/2017 01:09 PM clarify Action Type: Dealer contact
*** Performed by contact: Scott Smith, 5053215407
Result of Advice 1:this cat that is was being replaced was on the motor that failed and blew the head gasket and coolant out the sides. a short block was put in afterwards. with old cat in place

*** PHONE LOG 04/12/2017 01:39 PM Pacific Daylight Time CSchang-TL Action Type:Web Contact
Advice 1: Tech called in.
After reviewing the case and the flight recordings, the O2 sensor shows a bad catalytic converter. Tech is advised to replace the bank 1 catalytic converter and reset the adaptives. Tech will report his findings.

*** PHONE LOG 04/13/2017 04:07 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: There was never doubt about the cat being bad. The issue is, it was just replaced less than 1K ago, so we are trying to find route cause before replacing it again. That is why the case was escalated.

*** PHONE LOG 04/13/2017 03:03 PM Pacific Daylight Time MBautista Action Type:Outgoing call
Advice 1: The case has been escalated to an FTS. An FTS or a CA representative will contact you to coordinate the visit.

*** PHONE LOG 04/19/2017 09:24 AM Pacific Daylight Time CSchang-TL Action Type:Web Contact
Advice 1: Scott,
To my knowledge, this vehicle is repaired and the customer has not returned. Can you please close this case at your earliest convenience?

Problem Description :
HEAD BOLT PULLED THREADS PULLED OUT WHEN REPLACEING HEAD GASKET

Diagnostics Performed :
FRONT HEAD GASKET WAS LEAKING AT CLYN #6, FOUND 3 HEAD BOLTS AROUND CLYN #6 TO BE LOOSE. THOSE THREE BOLTS WHEN REMOVE THE THREADS IN THE BLOCK CAME OUT.

*** PHONE LOG 04/04/2017 06:21 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Take a few photos of the valve train (not the valve cover) to determine if the engine was maintained properly. Attach the photos to the case and add a note to the case as we are not alerted when an attachment is added. Thank you

Advice 2: Before approval is granted, you are required to complete the REVISED WRTY143 Engine Core Data Form dated 11-1-2016, attach it to this case as outlined in Pitstop PS410 to proceed. The form must include the RO #, mileage, Dealer info, VIN #, (part #'s not required) signed and dated by the technician and service manager. We are not notified when you add an attachment so please add a note to the case once the form has been attached. Thanks

*** PHONE LOG 04/05/2017 09:33 AM Pacific Daylight Time SOkimura Action Type:Web Contact
Advice 1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

· Replace the engine with a long block, if available; otherwise, please order a short block assembly

· If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

· If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

· Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components.

· If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

· The Turbo and oil feed line should be replaced if sludge or metal debris are found.

· Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

Advice 1: Robert, please attach one or two clear, well lit photos of the valve train to the case. Attach at least one clear photo of any metal debris or damage that you find. If you have verified there has been no abuse or external impact, the engine is not used or from a junk yard, and the warrant is valid according to WEB DCS, you will also need to review warranty bulletin 2015-09 and attach the core data sheet WRTY143. Make sure it is the newest form, released on 11-1-16. It will need to be filled out, signed by both you and your service manager (no electronic signatures or stamps), dated and attached to this PWA case before it can be approved Please add a note to the case once everything is attached so that I know it is there.

Advice 1: Robert, there is no picture of the valve train attached. Please add a photo of the entire valve train on at least one head and let me know when it is attached. You will also need to add the RO number to the core data sheet and attach the core data sheet again.

*** PHONE LOG 04/06/2017 05:14 AM Pacific Daylight Time GPhillips-TL Action Type:Web Contact
Advice 1: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

- Replace the engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.

- If equipped with a turbo, be sure to check the turbo and oil feed line as well. Replace the turbo, oil feed line and banjo bolt if build up, metal debris or excessive wear to the turbo are found.

- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

*** This is a Request for Assistance ***

Problem Description :
VEHICLE TOWED INTO SHOP , FOUND OUT VEHICLE WAS OVER HEATING .

Diagnostics Performed :
SCANNED VEHICLE NO CODES FOUND , CHECKED THEROMSAT OPERATION WHICH WAS GOOD , NO MISS FIRE COEDS IN SYSTEM , WHEN ENGINE GETS HOT ALL THE COOLANT WAS BEING PUSHED OUT FROM THE RADIATOR TO THE COOLANT RESVIOR , I USED COMBUSTION LEAK TESTER , FOUND OUT HEAD GASKET IS BLOWN , FOUND COMBUSTION GASSES INSIDE THE COOLING SYSTEM , ALSO WHEN I SNAP ON THROTTLE ALL THE COOLANT GOES UP IN AIR THRU THE RADIATOR CAP ,NOT SURE IF THE BANK 1 HEAD GASKET IS BLOWN OR BANK 2 , ILL HAVE TO REMOVE BOTH HEADS OFF AND LOOK FOR THE CRACKS ETC.

*** PHONE LOG 04/11/2017 12:11 PM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: To try and pin point if the head gaskets are both blown, perform a cylinder leak down test on all cylinders and note the percentage of leak down and note where the air is escaping from during the test (radiator, intake, exhaust, another cylinder, or crankcase) and inspect the spark plugs.

*** NOTES 04/12/2017 07:37 AM clarify Action Type: Dealer contact
*** Performed by contact: Sagar Farooq, 6315695700
Result of Advice 1:performed leak down test on all 6 cylinders , all of them are good 0 %
Additional Comments:but i found out head gasket is leaking on bank 1 , seems like its been leaking for a while , on the edge of the head and block , pictures are attached to the case you can review them .

** Admin Note ***
ervice alert escalated to CA as : K3435435 on 04/12/2017

*** PHONE LOG 04/13/2017 06:55 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: 0% leakage on a cylinder leak down test is not a valid test result. Even a brand new engine has some leak down.
Advice 2: Since the bank 1 head gasket is leaking, please get authorization to remove the bank 1 valve cover and to check the bank 1 head bolts. Make sure none are loose and that the threads in the block are not damaged at all. Let me know what you find. Thanks.

*** NOTES 05/01/2017 11:17 AM clarify Action Type: Dealer contact

Result of Advice 1:found out threads in the block are no good ,
Result of Advice 2:bank 1 threads in the block are damage.
Additional Comments:I will attached the pictures to case , took pictures with scope .

*** PHONE LOG 05/01/2017 12:52 PM Pacific Daylight Time BLall-TL Action Type:Outgoing call
Advice 1: Based on the information you provided, my recommendation is to replace the engine AFTER GETTING APPROVAL.

Advice 2: If the vehicle is under warranty, you are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it and a picture of the VIN and engine S/N. Based on the information provided my recommendation is to replace engine with a long block if available, otherwise please order a short block, oil pump, and cylinder head if needed. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If a short block is installed, make sure all of the ladder frame bolts are present before installing the BSM and if the head is replaced make sure all the check balls are inserted in the oil ports before the head is installed. They should be installed with the head off of the vehicle. If the failed engine has catastrophic damage, (rod through block, large metal debris in the pan, or seized engine) do not reuse the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

Problem Description :
customer states smell of coolant entering cabin

Diagnostics Performed :
verified concern, hoist veh, found coolant residue on front of block and underneath veh at parting line between engine and trans, trace residue trail as high as the side of the head under the thermostat housing right next to the crank sensor. head gasket is seeping externally at this location, nothing higher up so it must be coming from gasket. also pressure builds quickly in cooling system with pressure gauge attached when veh is started. suspect blown head gasket. photos attached that are 2 minutes apart showing the spread of coolant from the gasket.

*** NOTES 04/28/2017 07:12 AM clarify Action Type: Dealer contact
*** Performed by contact: Shane Johnson, 7329221050
if you switch between the 2 pictures(taken 2 mins apart) you can see the spread of coolant
Additional Comments:if you switch between the 2 pictures(taken 2 mins apart) you can see the spread of coolant

*** PHONE LOG 04/28/2017 07:19 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Shane,
Check to see if the head bolts for the cylinder head are torque down to spec's per the shop manual.

*** NOTES 04/28/2017 07:23 AM clarify Action Type: Dealer contact
*** Performed by contact: Shane Johnson, 7329221050
Result of Advice 1:head bolt torque cannot be checked because they are of the torque to yield type. the torque amount cannot be verified with this type of bolt.

*** PHONE LOG 04/28/2017 07:35 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Shane,
I know the head bolts are torque to yield. I just want to know if there loose when you try to re torque them. Note, either way the cylinder head has to come off so retorquing the head bolts is not an issue.

*** NOTES 04/28/2017 08:19 AM clarify Action Type: Dealer contact
*** Performed by contact: Shane Johnson, 7329221050
Result of Advice 1:how would i determine if they are not torqued properly when the torque is a specified angle not torque. what would you like them torqued to?

*** PHONE LOG 04/28/2017 08:30 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: I would try 78 to 80 ft lb.

*** NOTES 04/28/2017 08:54 AM clarify Action Type: Dealer contact
*** Performed by contact: Shane Johnson, 7329221050
Result of Advice 1:once all parts arrived and i perform teardown on the lefthand cylinder head i will report those results. i am assuming since there is no obvious external leakage on right hand head that no repairs should be made to that head?

*** PHONE LOG 04/28/2017 09:24 AM Pacific Daylight Time JGossling-TL Action Type:Web Contact
Advice 1: Shane,
I really want to know if the head bolts are loose as it could indicate a more serious concern. The bolt holes in the block maybe damaged.

*** CASE CLOSE 05/01/2017 08:13 AM clarify

Advice 1: Thank you for the picture
That is the head gasket leaking, Most of the time this is cause by the threads pulling out of the bock for the head bolts,Please remove the valve cover and attempt to re torque the head bolts to see if there are any that you cannot re torque, Please report your findings

*** NOTES 05/08/2017 07:12 AM clarify Action Type: Dealer contact
*** Performed by contact: Paul Henthorne, 3343297451

Result of Advice 1:I removed the front timing chain cover so I could check the head bolts. All of the head bolts are tight.

*** PHONE LOG 05/08/2017 07:20 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: If you are sure that none of the threads are pulled out of the block for the head bolts then remove that cylinder head and inspect for damage, cracks, warped block and head, cylinder wall damage, if there is none then replace that head gasket

ervice alert escalated to CA as : K3455549 on 05/08/2017

*** NOTES 05/10/2017 07:19 AM clarify Action Type: Dealer contact
*** Performed by contact: Paul Henthorne, 3343297451
I removed the head and inspected it. I do not see any cracks or leaks. There is coolant on the top side of the exhaust manifold. I do not see how if the head gasket is leaking that the coolant would run up to the top of the manifold. Just wanted to get your thoughts before I proceeded.
Additional Comments:I removed the head and inspected it. I do not see any cracks or leaks. There is coolant on the top side of the exhaust manifold. I do not see how if the head gasket is leaking that the coolant would run up to the top of the manifold. Just wanted to get your thoughts before I proceeded.

*** NOTES 05/10/2017 07:25 AM clarify Action Type: Dealer contact
*** Performed by contact: Paul Henthorne, 3343297451
I am going to send the head to be pressure tested. I just did not want to waste that money if you had seen this before and it was actually the head.
Additional Comments:I am going to send the head to be pressure tested. I just did not want to waste that money if you had seen this before and it was actually the head.

*** PHONE LOG 05/10/2017 08:12 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: A coolant leak above the exhaust manifold is not a common concern, Please send the head out for inspection

*** 05/17/2017 07:33:44 ***
Web - Note created on 05/17/2017 07:33:44 and created by Paul Henthorne
I sent the head out for inspection and everything checked out fine. Do you have any other suggestions before I proceed with replacing the head gasket and rebuilding the engine.

*** Phone - Advice created on 05/17/2017 08:11:51 and created by Frank Lusic ***
1: Paul called in and said that the head checked out fine, I asked him to install the old head gasket and then re torque the head to check the threads in the block to see if they pull out of the block then if it does not then reassemble the engine

*** 05/23/2017 06:19:20 ***
Web - Note created on 05/23/2017 06:19:20 and created by Paul Henthorne
I installed the new head gasket after checking re torqueing the head and the bolts torqued fine. I reinstalled all components and there were no leaks. The customer took the vehicle and drove approximately 40 miles and the check engine light came on. There were lean codes stored for bank 1. I put the vehicle on the lift and found that there was coolant leaking again from the exhaust manifold area.

*** Web - Advice created on 05/23/2017 09:44:24 and created by Frank Lusic ***
1: That's to bad
If you pressure test the cooling system can you see the source of the leak?

*** 05/23/2017 14:17:09 ***
Web - Note created on 05/23/2017 14:17:09 and created by Paul Henthorne
I removed the exhaust manifold and there was coolant all over the exhaust manifold gasket. I cleaned the head of all residual coolant and pressure tested the system. There is coolant leaking from the top middle stud hole that is not used.
*** Web - Advice created on 05/23/2017 14:23:24 and created by Frank Lusic ***
1: Thank you for that information , Based on this information Please replace the cylinder head and retest for proper operation

*** PHONE LOG 05/02/2017 11:51 AM Pacific Daylight Time BLall-TL Action Type:Web Contact
Advice 1: I reviewed the repair assistance case, the pictures attached to it, and the PWA form you attached to this case.
Advice 2: Your completed and signed WRTY143 engine core data form has been received and reviewed. Based on the information you have provided, you are authorized to replace the engine following normal service procedures. Please note:

· Replace the engine with a long block, if available; otherwise, please order a short block assembly

· If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required

· If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.

· Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the

reason why on your hard copy and replace the affected component.

· If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one.

· Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

· If this is a turbocharged engine make sure to also replace the turbo charger, oil feed line, and banjo bolts if there was metal contamination in the lubrication system or a catastrophic failure.

Problem Description :
cust-states engine was run hot and add coolant,fan was blow ok.

Diagnostics Performed :
i was remove both head cylinder to inspect the head cylinder wapped but almost all thread are stripped out.in this case more and likly will need a new short block.please get back to me wath to do thanks.

*** PHONE LOG 05/03/2017 06:27 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: • Replace the engine with a long block, if available; otherwise, please order a short block assembly

- If the short block is replaced, inspect the original cylinder head thoroughly to determine whether head replacement is required
- If a cylinder head replacement is required, re-use any parts of the original that can be transferred to the new head (if any cannot be transferred, supporting documentation will be required at the time of warranty claim submission). Check valve clearance per the service information in KGIS & inspect the cylinder head galley ports for any missing check balls.
- Thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components. If any of these components cannot be cleaned thoroughly, document the reason why on your hard copy and replace the affected component.
- If the failed engine had catastrophic damage (e.g., rod through block, large metal debris in the pan or seized engine), do not use the original intake manifold; replace the intake manifold with a NEW one. If the engine is equipped with a turbo then it should be replaced as well as the oil feed line to it.
- Make sure all of the ladder frame bolts are installed in the replacement short engine, if applicable.

Thank you.

*** Performed by contact: Shaun Runnells, 9097634740
*** This is a Request for Assistance ***

Problem Description :
Customer states that vehicle is overheating and there is a boiling sound

Diagnostics Performed :
Removed oil cap and found the oil/coolant mixture on the cap and inside valve cover. I found that the rear head is leaking all across the gasket and is leaking fresh and crusted coolant all the way down the engine and exhaust pipes. I was wondering, in a warranty repair would I be replacing the one known leaking head, or am I supposed to do both?

*** PHONE LOG 05/03/2017 10:02 AM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Hello Shaun
Most of the time if coolant is leaking externally at the head gasket it is caused by the threads pulling out of the block for the head bolts, Please remove the valve cover on that side and try to torque the head bolts to see if any will not tighten. Please report your findings

*** NOTES 05/03/2017 12:16 PM clarify Action Type: Dealer contact
*** Performed by contact: Shaun Runnells, 9097634740
Result of Advice 1:I was wondering, is there a specific torque that I should use? Or am I just giving the torque wrench a turn to see if any are loose?

*** PHONE LOG 05/03/2017 01:04 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: Just try to torque them down to the normal specs, if there is a problem the threads will pull out of the block

*** NOTES 05/03/2017 02:10 PM clarify Action Type: Dealer contact
*** Performed by contact: Shaun Runnells, 9097634740
Result of Advice 1:I will have to remove the cams to check the head bolts. I am unable to fit a tool in between the cams
Additional Comments:After removing the valve cover, I found engine sludge all over cams, cam sensor, and bottom of head. I will send pictures to the case.

*** PHONE LOG 05/03/2017 02:14 PM Pacific Daylight Time FLusic-TL Action Type:Web Contact
Advice 1: The oil jell is not that bad, you will need to remove the cams to check the head bolts

*** NOTES 05/05/2017 10:46 AM clarify Action Type: Dealer contact
*** Performed by contact: Shaun Runnells, 9097634740
Result of Advice 1:Sorry for the delay. I removed the engine and cams and found 2 of the lower head bolts the spin freely. I couldn't even torque them to 26 foot pounds.

*** PHONE LOG 05/05/2017 11:38 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: • You are now required to open a separate PWA case, prior to replacing the engine, to obtain approval as outlined in Warranty Bulletin 2015-09. Please be sure when you open the PWA case that you attach the WRTY Core Data Form to the case with both the service manager and technician signatures on it. Thanks
• Based on the information provided I recommend that you replace the engine on this vehicle as outlined in the shop manual. Replace engine with long block if available, otherwise please order a short block, oil pump, and cylinder head. When replacing the short block, you must inspect the original cylinder head thoroughly and determine what requires replacement and replace ONLY THOSE PARTS. All other parts of the original head should be transferred to the new head and make sure you thoroughly clean all metal and debris from any and all parts transferred from the damaged engine, including the intake runners, OCV, CVVTs, and timing components and make all necessary adjustments. If the failed engine has catastrophic damage, (rod through block, Large metal debris in the pan or seized engine) do not use the original intake manifold. Please replace the intake manifold with a NEW one. If you replace any new parts on the cylinder head, it is critical that you explain the reasoning for this in the case notes and on the back of your repair order. Contact the Parts Hotline for assistance with ordering needed parts if required. Please be prepared to provide all supporting documents (maintenance records, etc.) including photos when submitting your warranty claim.

*** Performed by contact: Tyler Bach, 3154295017
*** This is a Request for Assistance ***

Problem Description :
While removing front cylinder head on the vehicle. (1) of the head bolts has pulled the threads from the engine block. The concern is whether it can be repaired via some sort of heli-coil or will it need a new block?

Diagnostics Performed :
Verified: Customer drove vehicle (HOT) multiple times. Coolant blowing out of coolant reservoir. Engine was getting excessive air in cooling system. Another tech has installed a new thermostat in the past.

NOTE All the head bolts on the front cylinder head were loose while in the process of removing head.

*** PHONE LOG 05/08/2017 04:40 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Looks like a cylinder head was replaced in April of 2016 at NY069? Have you checked the cylinder head flatness with a precision straight edge as outlined in the shop manual?

*** NOTES 05/08/2017 07:00 AM clarify Action Type: Dealer contact
*** Performed by contact: Tyler Bach, 3154295017
Result of Advice 1:Per the shop manual it is determined the cylinder heads are indeed straight within specifications.
Additional Comments:Per the shop manual it is determined the cylinder heads are indeed straight within specifications.

*** PHONE LOG 05/08/2017 07:01 AM Pacific Daylight Time dbrisky Action Type:Web Contact
Advice 1: Based on the information provided I recommend that you open a PWA case to obtain approval to replace the short block.
