Op.1 AGMBatt -Replace AGM Battery

1. Began the (AGM) absorbent glass mat battery replacement by confirming the battery type and testing its condition to verify that replacement was necessary. Safely disconnected the negative terminal first, followed by the positive terminal, and removed any mounting brackets or covers securing the battery. Once the old AGM battery was removed, inspected the battery tray and cables for corrosion or damage. Then cleaned the terminals and installed the new battery, ensuring it was properly seated and secured. After reconnecting the terminals in the correct order, used a diagnostic scan tool to register the new battery with the vehicle's computer system. Finally, started the engine, checked the charging system, and confirmed that all electrical systems were functioning correctly.
