

Initial Notification Sent to All Authorized Dealers
by MasterCraft on August 21, 2006

MasterCraft is currently preparing a **mandatory recall** Service Bulletin that impacts 2007 tandem-axle trailers manufactured from the beginning of the model year until the end of July. The problem relates to the improper machining of 14-inch trailer wheels on the 2007 tandem-axle trailers which were purchased by MasterCraft from Jetstar Trailer Tire & Wheel. While a limited number of trailers are affected, if you are in receipt of this e-mail, your dealership has received one or more trailers in the identified recall group of trailers. Single-axle trailers are not affected, but all wheels on the affected tandem-axle trailers, including the spare tire/wheel assembly will need to be inspected. Attached hereto for your reference is a list of 2007 trailers in the recall population which our records indicate include trailers that have been delivered to you, and which will need to be inspected in accordance with the procedures described herein.

We are currently working to finalize the details of the Service Bulletin, along with a letter to consumers who have purchase the affected trailers and for whom we have received a warranty card. This information will be released within the next few days. However, we wanted to alert you in advance that this information is coming.

Please be aware that this **mandatory recall** will be monitored by the National Highway Traffic Safety Administration for compliance. You will need to inspect, and as necessary replace, all affected wheels as soon as possible.

Considering the seriousness of this recall, if you wish to begin the process before receiving the Service Bulletin, you may do so and submit a warranty claim with all information minus the time and code. Those will be inserted by our staff.

The steps for correction are:

TOOLS REQUIRED:

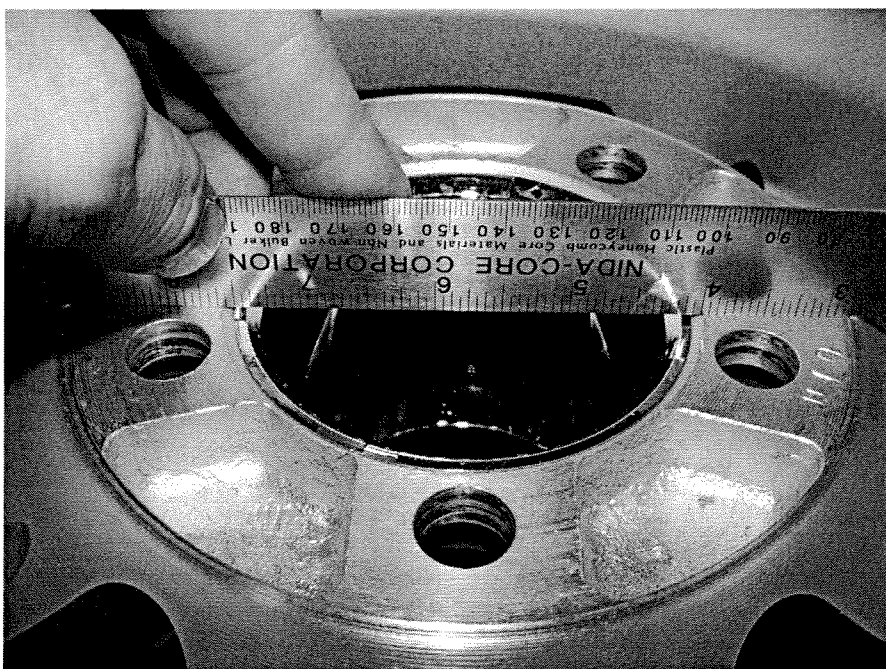

Impact gun; proper socket; extension; floor jack; jackstands; torque wrench.

PARTS REQUIRED:

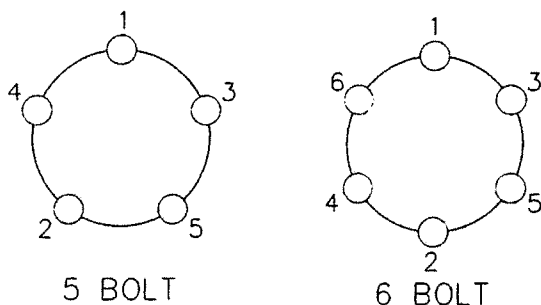

Part # 650374, 14-inch wheel/tire assembly; Part # 650611 lug nuts.

PROCEDURE:

Step 1: With the trailer jacked up and supported under jackstands, remove the lug nuts beginning with a rear wheel. (**NOTE: Both aft wheels should be replaced before the forward wheels are removed.**) The attached jackstand on the trailer is intended to provide support to the trailer when it is not hitched to the tow vehicle. When working on the wheels, portable jackstands should be placed under the aft metal portions of the trailer. Prior to removing tire/wheel assemblies, you should ensure that the trailer is firmly seated on the jackstands. Failure to do so may result in the trailer falling to the ground and any resulting damage would not be covered under the MasterCraft Limited Warranty!

Step 2: In order to properly inspect the wheel to determine whether it has been correctly machined, place the wheel face-down on a flat surface and lay a level or straight edge across the back side. If the center cap holds the straight edge up and prevents it from laying level across the width of the entire center ring, then the center cap assembly has not been countersunk deeply enough and the wheel will not seat correctly against the hub. This indicates that the wheel must be replaced.

Pattern for tightening lug nuts

Step 3: When the new wheel is installed, be sure to use the correct sized socket to tighten the lug nuts. The wrong size can round off the lug nuts and render them useless. If you lose a lug nut, replace it promptly. The correct size varies with different models, so you should verify that the correct size is being installed. Take special care to ensure that the replacement lug nut is the correct type. While the threads of the lug nut may match, it may be a size that does not hold the wheel securely against the hub, even when fully tightened. Be certain a replacement lug nut is an exact match for the original. Due to concern that the original lug nuts may have improperly seated and rounded off, you must use new lug nuts when installing the new wheels. You must use a torque wrench to accurately indicate the amount of torque that you are applying to the lug nut. Four-way wrenches, ratchets, and similar tools are not appropriate tools for accurately checking lug-nut torque. Use the following pattern to tighten lug nuts. On first torquing pass, bring up to 45-ft-lbs.; on second torquing pass, bring up to 70-ft-lbs.; on third torquing pass, bring up to 90-ft-lbs. Re-torque at 25 miles, again at 100 miles, and periodically thereafter.

Step 4: After completing the inspection/replacement of the wheels each axle, you must also check the spare tire. It is necessary to remove the tire/wheel assembly and inspection beginning with Step 2 hereof and following the instructions from there.

Thank you for your support in this critical matter.

MasterCraft Warranty Department
