Descriptive Information :

According to Muncie Power Products, Inc. the pressure switch may have been installed in proximity of the engine exhaust pipe. If the switch is positioned too close to the exhaust, the switch can see excessive heat and damage the internal diaphragm, possibly leading to seepage of transmission fluid out of the switch's construction screw on the side of the switch body. The switch's rubber diaphragm could become brittle, allowing transmission fluid onto the opposite side (internal construction) of the diaphragm. Over time, oil leaking from the PTO pressure switch could result in the heat blanket material absorbing these fluids.
