

The Red 10AWG for the Slideout Motor needs to be hooked up on the **protected side** of the **30Amp** Minibreaker. The 30Amp Minibreaker will have a dot of orange paint on the copper stud. The 50 Amp Minibreaker will have a dot of black paint on the copper stud. If the unit has the Arctic Package it will have additional Minibreakers which are 15Amp. Those will not have any paint on the stud. Do not hook up the Slideout to those.

We take the extra step of using anti-corrosion spray on these connections but it is not necessary because it is enclosed in the underbelly. There is no need to reapply the spray after repair.
