## Description of Defect :

**Description of the Defect :** Updated on July 19, 2016; Vehicles not repaired under 15V869 (including MY 2003-2008 Mazda6, MY 2004 RX-8, and MY 2006-2007 Mazdaspeed6) and under 14V773 (including MY 2004-2005 MPV and MY 2004-2005 RX-8) were carried over into 16V354. Mazda closed 15V869 and 14V773. It was also found that there are duplicated VINs in 16V354 and some vehicles have been replaced with like-for like replacement parts under 14V773/15V869. Mazda has corrected the vehicle volumes. Updated on June 10, 2016; Mazda has confirmed the historical registration area of the subject vehicles on this recall. As a result of that, Mazda is updating the VIN range and production period on each model. Accordingly, the total volume is 474,026.

On May 4, 2016, NHTSA and Takata came to agreement that all the non-desiccated frontal Takata PSAN (Phase-stabilized ammonium nitrate-based propellant) inflators that have not previously been subject to recall in the U.S should be treated as being involved with recall. Therefore, on May 16, 2016, Takata submitted the Defect Information Report #1 to NHTSA on the non-desiccated frontal PSAN inflators. As a part of them, PSPI inflator is affected with the DIR#1 and the following Mazda models are equipped with PSPI inflator and a part of them have not been subject coverage under the existing recall. MY 2004-2011 RX-8 and MY 2004-2006 MPV in zone A, MY 2004-2008 RX-8 and MY 2004-2006 MPV in zone B, MY 2004 RX-8 and MY 2004 MPV in zone C. This airbag inflator may potentially rupture during passenger side airbag deployment due to propellant degradation occurring after prolonged exposure to high absolute humidity, high temperatures and high temperature cycling.

FMVSS 1 : NR

FMVSS 2 : NR

**Description of the Safety Risk :** In the event of a crash necessitating deployment of the passenger side airbag, the inflator could rupture with metal fragments striking and potentially seriously injuring the passenger seat occupant or other occupant.

**Description of the Cause :** Based on Takata's investigation to date, the potential for such ruptures occurs in some of the subject inflators after several years of exposure to persistent

conditions of high absolute humidity, high temperatures, and high temperature cycling. The potential for rupture may also be influenced by other factors, including the specific vehicle environment, the inflator and propellant configuration, and manufacturing variability.
