escription of Defect :			
Description of the Defect :	that on certain CLA (1 platform), E-Class (213	manufacturer of Mercedes-B 17 platform), GLA (156 platfo 3 platform) and GLC (253 plat be overloaded under certain c	orm), C-Class (205 tform) vehicles, the starting
FMVSS 1 :	NR		
FMVSS 2 :	NR		
escription of the Safety Risk :	: In the event the starter is blocked due to engine/transmission damage (e.g. hydro locked engine), a very high electric current would flow through the starting current limiter during the subsequent start attempt. Should the driver attempt to start the engine repeatedly despite the engine not cranking, the very high electric current draw might lead to overheating of the starting current limiter. In a worst case, surrounding components might melt, and potentially ignite and lead to a fire.		
Description of the Cause :	handle very high curr	miter is designed for typical c ent under unique circumstanc ed to the point where it is un	ces when the engine/
dentification of Any Warning that can Occur :	NR		

Supplier Identification :

Component Manufacturer

Name : Gruner AG Address : 15-17 Bürglestr Wehingen FOREIGN STATES D-78564 Country : Germany

Chronology:

In June 2016, DAG launched initial investigations based on individual field reports describing instances in which customers allegedly experienced cases of thermally damaged starting current limiters.

The information contained in this report was submitted pursuant to 49 CFR §573

Parts of affected vehicles were requested for further analysis.

DAG determined in August 2016 that, in the analyzed cases, the starting current limiter was damaged due to electrical overload.

Throughout September and October 2016, possible root causes for the electric overload were investigated based on descriptions from field reports. Additionally, internal tests on test benches and in exemplar vehicles were conducted. It was determined that the blocking of the starter due to prior engine/transmission damage was an essential pre-condition for the observed defect on the starting current limiter.

In November and December 2016, the defect mechanism on the starting current limiter in the event of a blocked starter was analyzed. It was determined that multiple start attempts after the occurrence of a blocked starter might lead to the condition of an electrically overloaded starting current limiter.

In January 2017, the range of potentially affected vehicles was determined together with the supplier and the assembly plants.

In the beginning of February 2017, DAG determined that a potential safety risk cannot be ruled out.

Description of Remedy :

Description of Remedy Program :	As a precautionary measure an authorized Mercedes-Benz dealer will install an additional fuse in the electrical line to the starter. Pursuant to 49 C.F.R. § 577.11(e), MBUSA does not plan to provide notice about pre-notice reimbursement to owners since all involved vehicles remain covered under the vehicle's New Vehicle Limited Warranty
How Remedy Component Differs from Recalled Component :	NR
Identify How/When Recall Condition was Corrected in Production :	NR

Recall Schedule :

Description of Recall Schedule :	Owners will be notified with an interim letter in late March, and again when parts become available in July 2017, approximately one week after recall launch to the dealers. Dealers will be notified of the pending voluntary recall campaign in February 2017. A copy of all communications will be provided when available.
Planned Dealer Notification Date : Planned Owner Notification Date :	FEB 22, 2017 - NR

* NR - Not Reported
