Description of Defect :

Description of the Defect : Daimler AG (DAG), the manufacturer of Mercedes-Benz vehicles, has determined that on certain C-Class (platform 205), CLS-Class (platform 257), E-Class (platform 213 and 238), G-Class (platform 463), a reset in the Central Powertrain Controller (CPC) control unit could occur while driving due to a software error.

FMVSS 1 : NR

FMVSS 2 : NR

Description of the Safety Risk : This could result in various consequences.

If the reset occurs during ECO Stop the engine will not restart as intended. In addition, vehicles could coast due to engine stalling. In this case the engine can be restarted while coasting. An engine stall while driving might increase the risk of a crash.

Description of the Cause : Due to an incorrect coding by a supplier, the CPC control unit software might not meet specification.

Identification of Any Warning NR
that can Occur :

Supplier Identification :

Component Manufacturer

Name : Continental Automotive GmbH
Address : Siemensstrasse 12
Regensburg FOREIGN STATES D-93055
Country : Germany

Chronology :

In March 2018, DAG launched initial investigations based on findings in internal test drives during the development of the C-Class (205 platform) facelift where the ECO Stop Restart function did not perform as specified.

These investigations indicated a reset in the CPC control unit as the root cause.

Starting in April 2018, updated CPC control unit software was developed.

During that time, an individual field report outside the USA describing an engine stall on a 257 vehicle was submitted to DAG and investigations were initiated.

In June 2018, additional individual field reports outside the USA describing an engine stall on 222 vehicles were brought to DAG's attention and were added to this investigation. This particular investigation indicated a potential influence of the CPC control unit on the described customer complaint. Further analysis was started.

In August 2018, this analysis identified a reset in the CPC control unit due to incorrect coding of the CPC control unit software as the root cause.

In September 2018, the range of potentially affected vehicles was identified.

In October 2018, DAG determined that a vehicle stall cannot be excluded.

Description of Remedy :

Description of Remedy Program : As a precautionary measure an authorized Mercedes-Benz dealer will update the CPC control unit software on the affected vehicles.

Pursuant to 49 C.F.R. § 577.11(e), MBUSA does not plan to provide notice about pre-notice reimbursement to owners since all involved vehicles remain covered under the new vehicle warranty.

How Remedy Component Differs from Recalled Component : Vehicles equipped with correct CPC control unit software.

Identify How/When Recall Condition was Corrected in Production : A change in the CPC control unit software ensures that this issue can no longer occur from October 20, 2018 onwards.

Recall Schedule :

Description of Recall Schedule : Dealers will be notified of the pending campaign in November 2018. Owners will be notified with a letter in December 2018, approximately one week after recall launch to dealers. A copy of all communications will be provided when available.

Planned Dealer Notification Date : NOV 12, 2018 - NR

Planned Owner Notification Date : DEC 28, 2018 - NR
