Description of Defect :

Description of the Defect : Takata has determined that a defect related to motor vehicle safety may arise in some of the subject ammonium nitrate passenger airbag inflators due to propellant degradation occurring after prolonged exposure to high absolute humidity, high temperatures and high temperature cycling. Activation of a non-desiccated ammonium nitrate inflator with degraded propellant may result in an inflator rupture.

Additionally, some of the driver airbag inflators show a pattern of propellant density reduction over time that may predict a future risk of inflator rupture. The potential for such ruptures may occur in some of the subject inflators after several years of exposure to persistent conditions of high absolute humidity.

FMVSS 1 : NR

FMVSS 2 : NR

Description of the Safety Risk : An inflator rupture may cause metal fragments to pass through the air bag and into the vehicle interior at high speed, which may result in injury or death to vehicle occupants.

Description of the Cause : NR

Identification of Any Warning that can Occur : There is no preceding warning.
