

New Safety Recall Advanced Communication – 94D

FCA US LLC (FCA US) has announced a safety recall on certain 2026 model year (DT) Ram 1500 Pickup trucks.

REASON FOR THIS SAFETY RECALL

Some of the above vehicles may have been built with an incomplete wire harness connection for the front seat wiring harness to the seat airbag or to the body wiring harness. An improperly secured connector may prevent the airbag from deploying in those crashes. An airbag that does not inflate may increase the risk of injury in certain crashes.

The condition described above does not comply with Federal Motor Vehicle Safety Standard (FMVSS) 571.214 requires front seat air bag deployment during certain crashes. An improperly secured front seat air bag squib connector may prevent the airbag from deploying in those crashes. Also, FMVSS 571.208 S4.1.5.3, requires that "[e]ach passenger car manufactured on or after September 1, 1997, shall comply with the requirement of S4.1.5.1(a)(1) by means of an [air bag] at the driver's and right front passenger's position." An improperly secured connector may prevent the passenger air bag from deploying, or deploying properly, in certain types of crashes.

SERVICE ACTION

FCA US will conduct a voluntary safety recall to inspect the electrical connections on the seats and secure all connections as needed. The remedy for this condition is not currently available. Dealers will be notified of the launch of this safety recall by way of established communication methods. This recall is estimated to launch in 4th Quarter of 2026.

We ask that you please take the time to ensure that your personnel are aware of this communication and are prepared to execute a customer friendly process for inquiries regarding involved vehicles.
