INTERMITTENT WIPER OPERATION

This bulletin has been amended to apply to all vehicles with Intermittent Rain Sensing Wipers.

APPLIED VEHICLE: Nissan vehicles with Intermittent Rain Sensing Wipers

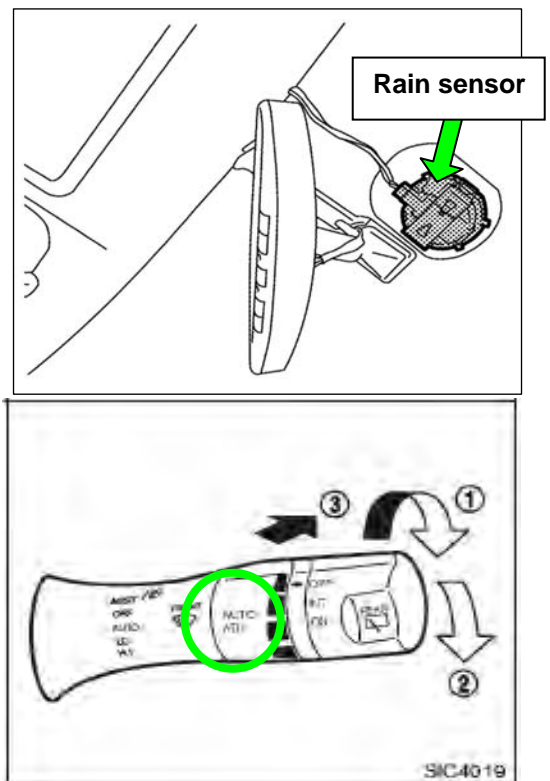

SERVICE INFORMATION

Vehicle may be equipped with the Rain-Sensing Auto Wiper system.

With this system:

- A rain sensor is located on the windshield, if equipped.
- When the wiper lever is pushed down to the intermittent (INT) position, the wipers will operate when the rain sensor detects rain.
- May only make a **single stroke** unless rain is detected directly above the sensor.
- May also be identified by the word "AUTO ADJ" on the wiper switch (some models).

NOTE: The wipers may operate unexpectedly when dirt, fingerprints, oil film, or insects are located on or around the sensor, or when exhaust gas or moisture affect the rain sensor.

If a customer states the wipers do not work when the wiper lever is pushed down to the intermittent (INT) position, make sure the customer is familiar with the above information.

- You can demonstrate the operation of the system by pushing the wiper lever down to the intermittent (INT) position and spraying/sprinkling water over the rain sensor.

NOTE: If a wiper-operation incident does occur, refer to the applicable Electronic Service Manual (ESM) for further diagnostic assistance.
