DATE: March 5, 2013

SUBJECT: 2013 CX-5 ACCESSORY TRAILER HITCH USER GUIDE UPDATE (0000-8E-R01)

Installation Instructions and the User Guide for the CX-5 accessory trailer hitch have been updated to remove the reference to towing capacity. To determine the towing capacity, vehicle owners should refer to the Owner's Manual.

Updated User Guides are being included in the kits. If you see table 1 in the User Guide (as shown below) please discard it and provide the attached version to the vehicle owner instead.

NOTE: Updated Installation Instructions and User Guides are available on the MXConnect accessory website (direct link below):

Mazda CX-5 Trailer Hitch User Guide

mazda
Genuine Accessories

Congratulations on your purchase of a Genuine Mazda Trailer Hitch specifically designed for your CX-5.

Your new Trailer Hitch has been specifically designed for your CX-5 to safely tow up to weights shown in Table 1, when properly attached and secured.

Engine	Maximum Gross Trailer Weight (lbs)	Maximum Gross Tongue Weight (lbs)
2.0L Non-Turbo	1500	200

~~NOTE: If your vehicle is equipped with a power train other than what is noted in the table above, see vehicle's owner's manual for towing specifications.~~

Please read the vehicle's owner's manual for detailed information concerning towing capacities and other valuable information. Your trailer hitch came installed with a draw bar specifically designed for this vehicle. Always use the supplied draw bar for towing any trailer with this vehicle. Failure to use the supplied draw bar could result in damage to this vehicle.

An optional Trailer Lighting Power Converter is available from your local Mazda Dealer. The converter is designed to an industry standard, being able to accommodate up to 9 Amps of current draw. See your local dealer concerning this upgrade.

Trailer Lighting Power Converter

Included with your trailer hitch is a Power Converter with a 4-way flat electrical connector to accommodate standard trailer lighting. This converter is designed to an industry standard, being able to accommodate up to 9 amps of current draw.

Overload Protection

Should a trailer draw more than 9 amps, the Power Converter is designed to interrupt the power to the trailer to protect the electrical system. There is separate protection for the Brake, Turn and Marker Lamp circuits. For example if the Marker Lights draw excessive current, the Brake Lights and Turn Signals will continue to function normally. After power is removed (lights turned off) for several minutes, the Power Converter will reset itself.
