Activated Charcoal Filter System, Solenoid Valve 1 -N80- (Canister Purge Valve) Diagnosis

 **Note:**

Please read bulletin in its entirety before beginning diagnosis.

One or more of the following fault codes may be stored in the ECM Fault Memory:

DTC	Description
P043E	EVAP emission system leak detection reference orifice low flow
P043F	EVAP emission system leak detection reference orifice high flow
P0440	EVAP emission control system malfunction
P0441	EVAP emission control system incorrect purge flow
P0442	EVAP emission control system small leak detected
P0443	EVAP emission system purge control valve circuit
P0444	EVAP emission system purge control valve circuit open
P0445	EVAP emission system purge control valve circuit shorted
P0447	EVAP emission system vent control circuit open
P0448	EVAP emission system vent control circuit shorted
P0449	EVAP emission system vent valve/solenoid circuit

Technical Bulletin

P0455	EVAP emission control system gross leak detected
P0456	EVAP emission control system small leak detected
P0457	EVAP emission system leak detected (fuel cap loose/off)
P0458	EVAP emission system purge control valve circuit low
P0459	EVAP emission system purge control valve circuit high

Note:

DO NOT diagnose or replace Canister Purge Valve -N80- **before** performing the repair procedure as outlined in this bulletin.

Technical Background

Completing the GFF function test and performing a vacuum check on the Canister Purge Valve -N80- are essential to diagnose proper operation and to avoid unnecessary replacements.

Production Solution

Not applicable.

Technical Bulletin

Service

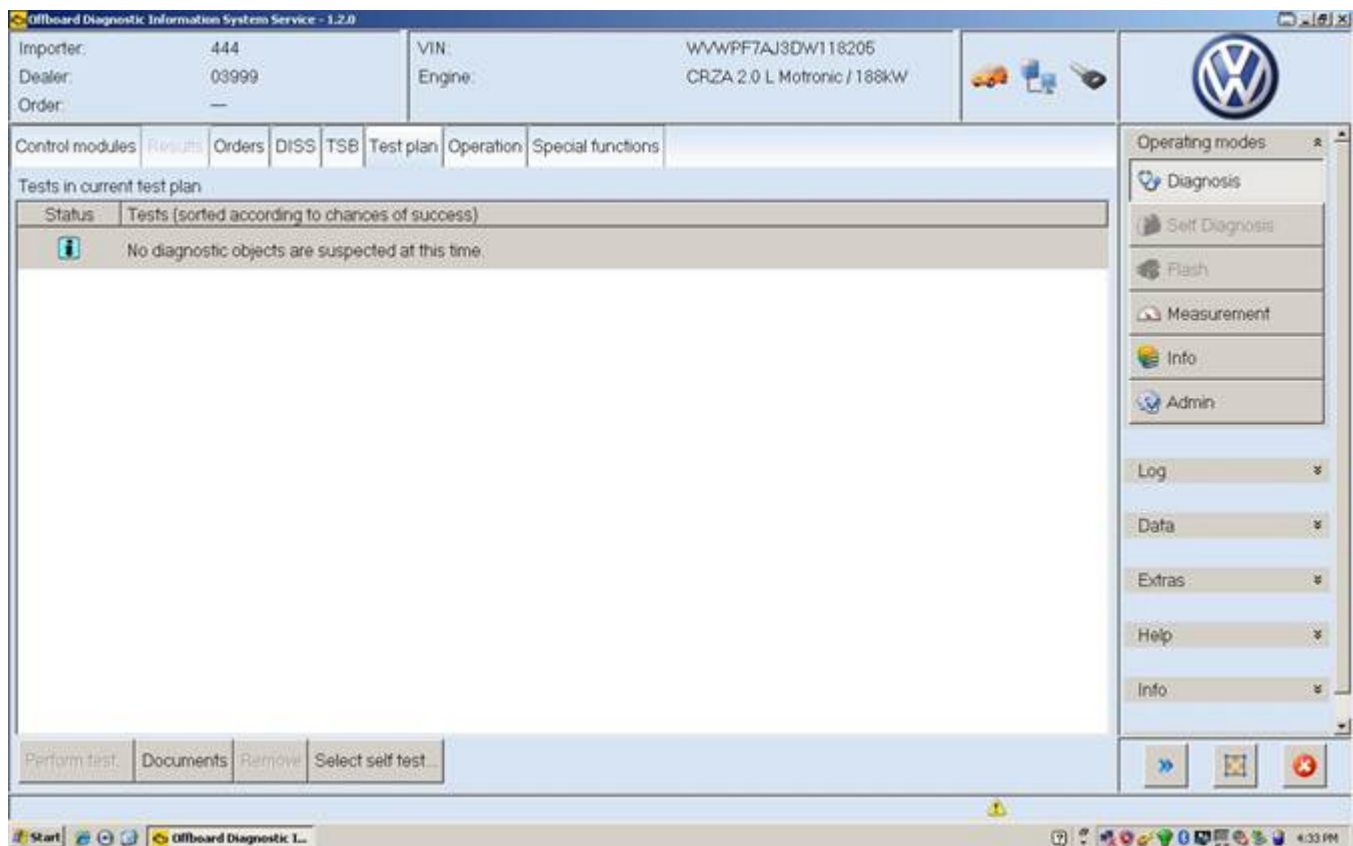

Note:

Test steps for this bulletin are written for diagnosis using Off-board Diagnostic Information System (ODIS). Though the tests performed will be the same, the process required to access the function tests may be different if VAS-PC is used.

Perform Guided Fault Finding test plan for Activated charcoal filter system, solenoid valve 1 -N80- to determine operation of valve.

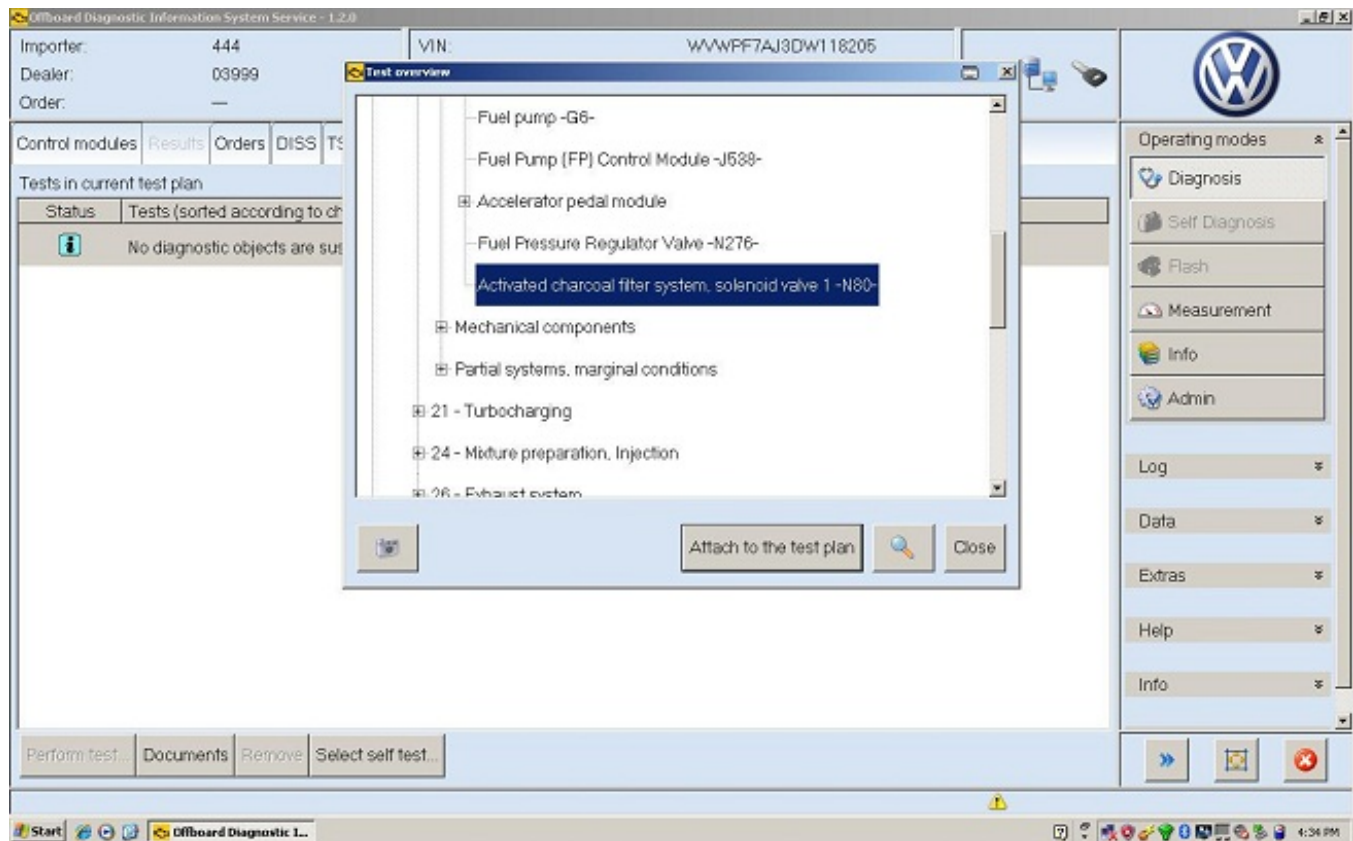

- Once ODIS has loaded, and the vehicle information has been updated, select the “Test Plan” top tab.

- Select either the “Select self test” button and locate the test plan for the “Activated charcoal filter system, solenoid valve 1 -N80-” [Powertrain (Repair Group 01;10 to 26; 28 to 39) > 01-Engine > 20 – Electrical Components > Activated charcoal system, solenoid valve 1 –N80–], or utilizing the search button in the “Extras” drop down side tab, search for “N80” with the object type “Test” selected.

Technical Bulletin

- Attach the “Activated charcoal filter system, solenoid valve 1 -N80-“ test to the test plan list.

Technical Bulletin

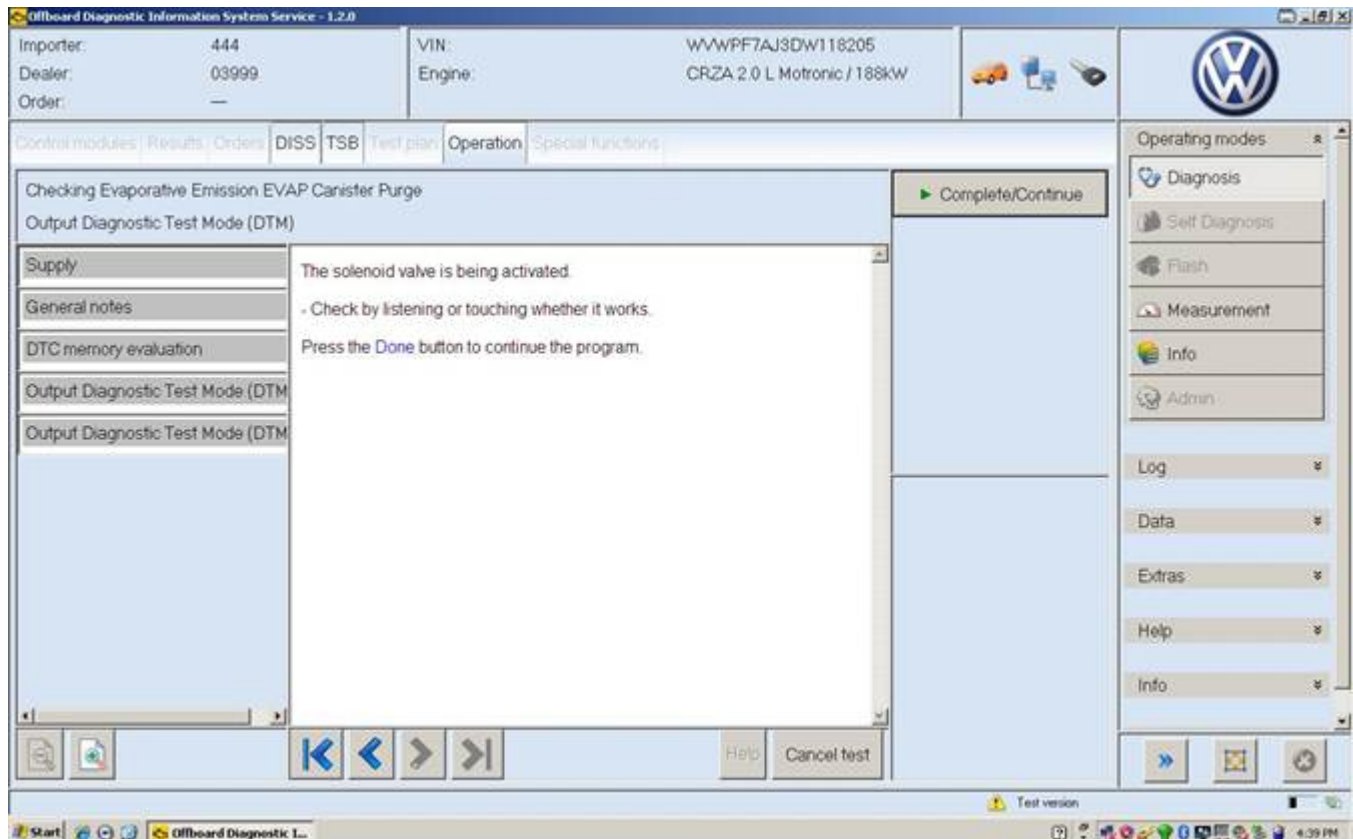

- Highlight the Activated charcoal filter system, solenoid valve 1 -N80- test plan and select “Perform Test”.

- When the test starts, the -N80- Canister Purge Valve will be activated via the output diagnosis test mode, listen and/or feel for an audible “click” sound coming from the -N80- purge valve.
- Answer on screen prompts.

Technical Bulletin

- If audible “click” noise is heard, the valve itself, wires and the control module are OK.

 **Tip:**

The audible “click” sound may be heard easier if the vehicle hood is open.

Technical Bulletin

- If prompted to continue function test, select “No”.
- Complete remainder of test plan.

- If audible “click” noise is heard, the -N80- Activated Charcoal Filter System Solenoid Valve is operational, and a vacuum check must be performed to verify if the valve is sealing properly. If audible “click” noise is not heard this bulletin does not apply, continue Guided Fault Finding based diagnosis.

Technical Bulletin

Perform vacuum check to verify proper sealing of -N80- Canister Purge Valve

 **Note:**

Multiple test procedures are listed below, based on the applicable engine code. Please select the procedure that fits the vehicle being repaired.

Canister purge valves connected with removable rubber hoses (CBPA, CBTA, CBUA, CRZA, CDVB, CNNA, CGRA, CPPA, CPLA, CPRA, CPKA engine codes):

- With the -N80- purge valve disconnected from the engine, attach the VAS6213 Vacuum / Pressure pump to the engine side of the valve (side flow indicator on valve points to), and apply approximately -0.6 Bar (-450 mmHg) of vacuum.

 **Tip:**

If practical, vacuum check may be performed with Canister Purge Valve -N80- removed from engine.

 **Note:**

When performing a vacuum check on the canister purge valve please ensure to hook the vacuum pump up correctly for the valve (Vacuum should be applied to the side the flow indicator is pointing). If the vacuum pump is installed incorrectly, the seal will be pulled open, causing a false leak.

- Incorrect Installation of VAS6213 vacuum pump on the Canister Purge Valve (N80). This will create a false leak resulting in unnecessary replacement. (Bosch valve shown below)

Technical Bulletin

- Correct installation of VAS6213 vacuum pump on the Canister Purge Valve (N80). (Bosch valve shown below)

- Correct installation of VAS6213 vacuum pump on the Canister Purge Valve (N80). (Freudenberg and Valeo valves shown below)

- If the valve holds vacuum, ***do not*** replace -N80- Activated charcoal filter system, solenoid valve. The canister purge valve is not causing the fault codes to store. This bulletin does not apply. Continue Guided Fault Finding based diagnosis for faults.
- If the valve does not hold vacuum, replace -N80- Activated charcoal filter system, solenoid valve. Perform leakage test to verify there are no further issues.
- Clear any DTCs that were caused by disconnecting the canister purge valve electrical connector during the test.

Technical Bulletin

 **Note:**

Performing a road test may not allow fuel tank leakage diagnostics to run. A tank leakage test must be performed to verify repairs.

Canister purge valves with non-removable plastic hoses on engine side of valve (CCTA, CBFA, CGFA engine codes):

- With the engine off, remove rubber hose from EVAP Canister side of N80 Canister Purge Valve.
- Install VAS6213 vacuum pump to the N80 purge valve as shown below.

- Disconnect the electrical connector from the purge valve.
- Start the engine and allow it to idle.
- Monitor the reading on the vacuum gauge. The reading should be at 0 PSI or higher (no vacuum should be measured).
- If there is no vacuum present at the vacuum gauge, **do not** replace -N80- Activated charcoal filter system, solenoid valve. The canister purge valve is not leaking and is not causing the fault codes to store. This bulletin does not apply. Continue Guided Fault Finding based diagnosis.
- If vacuum is present, replace -N80- Activated charcoal filter system, solenoid valve. Perform leakage test to verify there are no further issues.
- Clear any DTCs that were caused by disconnecting the canister purge valve electrical connector during the test.

Technical Bulletin

 **Note:**

Performing a road test may not allow fuel tank leakage diagnostics to run. A tank leakage test must be performed to verify repairs.

Canister Purge Valve on Jetta Hybrid (CNLA engine code):

- With engine off, disconnect EVAP line connection to -N80- purge valve beneath coolant expansion tank shown below.

Technical Bulletin

- Use the VAG1318 pressure gauge kit to assemble an adaptor using tool numbers VAG1318/24, VAG1318/11, and the female to female adaptor for the pressure gauge as shown below.

Technical Bulletin

- Install the adaptor to the EVAP line connection to the -N80- purge valve and connect VAS6213 vacuum pump to the adaptor as shown below.

- Disconnect the electrical connector from the purge valve.
- Start the engine and allow it to idle.
- Monitor the reading on the vacuum gauge. The reading should be at 0 PSI or higher (no vacuum should be measured).
- If there is no vacuum present at the vacuum gauge, **do not** replace -N80- Activated charcoal filter system, solenoid valve. The canister purge valve is not leaking and is not causing the fault codes to store. This bulletin does not apply. Continue Guided Fault Finding based diagnosis.
- If vacuum is present, replace -N80- Activated charcoal filter system, solenoid valve. Perform leakage test to verify there are no further issues.
- Clear any DTCs that were caused by disconnecting the canister purge valve electrical connector during the test.

Note:

Performing a road test may not allow fuel tank leakage diagnostics to run. A tank leakage test must be performed to verify repairs.
