2011-2014 - F-Super Duty - 6.7L - Diesel Fuel Conditioning Module (DFCM) Vibration/
Buzzing/Growl

Some 2011-2014 F-Super Duty vehicles equipped with a 6.7L diesel engine may exhibit a vibration/buzz/growl noise from the DFCM and/or low pressure fuel lines. If the noise is experienced when the fuel level is at or below 1/4 tank, this is a normal characteristic and is due to slight amounts of air entering the fuel system during low fuel level conditions. No repairs should be attempted. Fuel system and vehicle durability as well as vehicle drivability and distance to empty (DTE) are not affected. If the noise is occurring with the fuel level above 1/4 tank, follow Pin Point Test MA in the on-line PC/ED to diagnose the low pressure fuel system. The DFCM should not be replaced for audible noises until the fuel filters have been replaced and the system reevaluated.
