

Technical Service Bulletin

PSS 46 TT RS brake noise

46 13 28 2032729/1 January 25, 2013.

Model(s)	Year	VIN Range	Vehicle-Specific Equipment
TT RS	2012 -2013	All	All

Condition

The customer may complain of a high-pitched squeal or squeak from the brake system when braking at slow speeds, even though the brake pads and discs still have a significant life left.

Technical Background

The noise is caused by the natural frequency of front brake components.

Like all high-performance brakes, TT RS brakes are designed for optimum braking performance. High-performance brakes must satisfy a wide range of functional demands, including having good pedal response and a short stopping distance after several repetitive brake applications.

It is not possible to entirely eliminate all brake noises under certain unfavorable driving conditions. Brake noise does not have a negative impact on braking performance or wear.

Production Solution

Not applicable.

Service

1. Explain to the customer that a solution is forthcoming and that no repairs are necessary at this point. Do not replace any components for this condition since this will not resolve the customer's concern.
2. Create a PSS record in the PSS application via the hyperlink in Accessaudi.com (Figure 1) or Technical Assistance page in Elsa (Figure 2).
