

ROADSTER 2014 Steering Pulling To The Right (RT) _98586_TST61Y014S07_en

Summary:

This TST discusses the complaint of the steering pulling to the right side while driving at highway speeds.

Type:

General

TST Detail:

BRP is presently investigating this issue and will need each complaint to have a BOSSWeb Case opened to report it.

Make sure to cover the essential details:

1. Make sure the front tire pressure is equal on both sides and set to 20 \pm 2 psi.
2. Confirm the cst complaint with a road test. Consider the road crown.
 - a. If the road crown is aggressive, safely try riding in the center and left lanes to see if the pulling changes (center lane = no pull, left lane = left pull)
 - b. If there is a change in the pulling behaviour then the complaint is based on road crown and nothing can be done to correct this.
 - c. If the pulling doesn't change then follow the next steps.
3. Swap tires from left to right (do not de-rim the tires to change the rotation direction, for a simple test riding in reverse rotation is acceptable).
4.
 - a. If the pulling has changed direction replace the tires with new ones.
 - i. If the new tires still pull to one side redo tests 3 as necessary.
 - b. If the pulling has not changed, perform a front wheel alignment.
5. Update the BOSSWeb Case with each result of the above steps.
