44421 SVT Raptor - Shock Absorber Noise Over Bumps

2010-2014 F-150 SVT Raptor vehicles are equipped with unique high-performance Fox shock absorbers designed for severe off-road use. Some customers may be concerned with boom, chirp, or clunk noises from the right front or rear shock absorber most often heard over small, sharp bumps in the road such as frost heaves, potholes, or expansion joints. Cold ambient temperatures can make the condition more apparent. This is a normal characteristic originating from the hydraulic motion of the fluid and inherent to the unique design of the shock absorbers. It is not caused by contact of any suspension components, nor will this condition have any detrimental effect on the life of the shock absorbers or suspension. Do not attempt to service to correct this normal condition.
