Bluetooth Connection Drops during a Phone Call

USA

Service Category

Section

Audio/Visual/Telematics

Cellular Communication

Applicability

2014 IS 250/350

APPLICABLE VEHICLES

2014-2015

IS250

2014-2015

IS350

CONDITION

Customer complains that the Bluetooth connection is dropped during their phone call. Customer will notice the phone call has changed to handset mode on the phone and vehicle display shows a slash through the Bluetooth icon.

Customer will also notice that their contacts cannot transfer from the phone into the vehicle.

RECOMMENDATIONS

Some phones (in particular company issued phones) have extra security which may prevent phone contact transfer. This can cause Bluetooth connectivity issues with certain phones.

Method to confirm issue:

- Pair a known good phone in customer's car that is the same phone model that the customer has, confirm phonebook transfer is successful.
- Delete "All personal data" in the vehicle.
- Delete all Bluetooth connections on the customer's phone.
- Re-pair customer's phone to the vehicle's Bluetooth system. If prompted on the phone make sure to allow contact transfer during the pairing process.
- Attempt phonebook transfer; confirm contacts are unable to transfer to the vehicle Bluetooth system.

Method to resolve issue:

Because this issue is caused by phone's security the customer will have to contact the corporate cell phone administrator and ask them to enable PBAP access (Phonebook Access Profile) for the phone.
