

Recommendations for use of the Denso DST-i diagnostic interface

Due to a limited supply of remaining Subaru Diagnostic Interface (SDI) boxes, SOA recommends that in all applicable situations technicians should use the new interface, the Diagnostic System Tester interface (DST-i).

The SDI will remain on the required tool list until 2019 to allow service of 2003 and earlier Subaru vehicles as required by law. However, for all instances where an interface is needed to diagnose 2004 and newer vehicles, the DST-i should be used.

It is recommended that the SDI box be secured and stored in a safe place, to be used only when needed on pre-2004 vehicles to avoid unnecessary wear and tear.

DST-i Applications:

Subaru Select Monitor III software (SSMIII) – The DST-i can be used in combination with SSMIII software for all 2004 to 2015 vehicles. (From the SSMIII main menu, use the F10 button to select the proper interface)

Subaru Select Monitor 4 software (SSM4) – The DST-i must be used in combination with SSM4 software for all 2016 and newer vehicles.
