Introduction

NOTE

Service Bulletin No. **T-SB-0158-14**, "2AZ-FE Engine Oil Consumption Inspection Procedure," **MUST** be performed first **BEFORE** continuing with the procedure in this bulletin.

Some 2006 – 2011 model year vehicles equipped with the 2AZ-FE engine may exhibit engine oil consumption. The piston assembly has been changed to minimize oil consumption. Use the following Repair Procedure to address this condition.

Repair Procedure (Continued)

- (6) Push the piston, connecting rod assembly, and upper bearing through the top of the cylinder block.

HINT

- Keep the bearing, connecting rod, and cap together.
- Arrange the piston and connecting rod assemblies in the correct order.

- (7) Repeat for the other 3 piston/connecting rod assemblies.

- F. Remove the connecting rod bearings.

HINT

Arrange the removed parts in the correct order.

- G. Inspect the cylinder bore for abnormal damage.

Visually check the cylinder bore for the presence of crosshatch.

- If the cylinder bore has visible crosshatch, the cylinder block is OK to re-use.
- Confirm that only light vertical marks are present, if any.

NOTE

- It is normal for an in-service block to have light markings present from carbon and should NOT be interpreted as excessive cylinder wall scratches.
- ONLY replace the short block if multiple, severe scratches are present.
- Do NOT hone the cylinder walls.

- H. Using a screwdriver, pry out the 2 piston pin hole snap rings.

HINT

If necessary, sublet the following specialized and precision operations to a local engine machining shop.

Figure 16.

2AZ-FE Engine Oil Consumption

Repair Procedure (Continued)

I. Remove the piston.

- (1) Gradually heat the piston to approximately 176° to 194°F (80° to 90°C).

Figure 17.

- (2) Using a plastic hammer and brass bar, lightly tap out the piston pin and remove the connecting rod.

Figure 18.

NOTE

- The piston and pin are a matched set.
- Arrange the pistons, pins, rings, connecting rods, and bearings in the correct order.
