F3 belt vibration complaint [New]

[Options](#) ▼

Sunday

Good day everyone,

BRP has surveyed a few F3 csts and has received the comment of vibration felt at certain speeds and RPM. After more discussion with these csts it was determined that the belt was the culprit of the vibration.

Everyone has gotten used to this characteristic of Spyders throughout the years but BRP wants to gather new information of this complaint for this year.

If a cst complains of a vibration please take the time to open a BOSSWeb Case and confirm the following information:

- At what **speed, RPM and gear position** is the vibration felt?
- What is the belt tension (before adjustment) at 3 different wheel rotation (120 degrees apart)?

For more details I encourage you to consult the 2015 Product Reference Article (see direct link on top RH corner of screen - announcement section).

Thank you.
