2 Oil Breather Vent

On DT12 DA/OA (large box) transmissions, oil may push out of the breather vent on top of the transmission and run around the outside of the housing to the rear bottom of the transmission. A plastic hose was added to the oil breather vent with approximate transmission serial number 1402497 (last seven digits). However, it is still possible for the plastic hose to leak if the seal to the breather vent fitting is not tight. The oil breather vent and hose were relocated to the left side of the transmission to further reduce the chance of oil leaks with approximate transmission serial number 1614270 (last seven digits).

To repair units with no oil breather vent hose, or a plastic hose on the right side of the transmission, install a ¼" ID hose of a suitable rubber material that is approximately 368 mm (14.5 in.) in length. Run the hose over the top of the transmission to left side front. The hose should end on the left side of the transmission at the AMT module. Secure with zip ties at the three indicated positions (1).
