| 2016 | RX450H | 2016 | RX350 |
|------|--------|------|-------|

CONDITION

Some customers may find the operation of the ventilated seat blowers to be loud when operating in the high position or linked to the HVAC operation (Auto mode).

RECOMMENDATIONS

In order to reduce the noise level from the ventilated seat blower, the ventilated seat blower airflow volume can be adjusted in the climate control seat customize parameters. There are three different setting in the customize parameters (Seat Blast Mode Setting):

| Techstream / Repair Manual Description | Setting Level |
|--|--|
| Standard* | Highest ventilated seat blower airflow setting |
| Silent (Wind Amount Hi) | Middle ventilated seat blower airflow setting |
| Silent (Wind Amount Low) | Lowest ventilated seat blower airflow setting |

*Default setting

Note: These settings will change the amount of airflow which moves through the seat and may impact seat ventilation performance.
