

SSM 46170	2013-2017 Escape vehicles equipped with moonroof exhibit a small vent opening position of 5 mm. This is the normal vent position for optimal NVH/windnoise qualities. When the vent is closed, the moonroof will open to the 10 mm position then close. The sliding glass also opens to the 10 mm position to give the glass enough clearance before it opens to the rearward position. This is the normal operating characteristic. No repairs are required.
