EDITOR'S NOTE: This article replaces the one posted in **May 2017** to extend the article's shelf life. The issue(s) covered are still being addressed.

Some customers have reported that when opening the tailgate after it rains they're getting doused with a stream of water while standing under it. We're aware of this issue and have it under investigation.

If the water is streaming down along the sides of the tailgate, it's normal. The tailgate is designed to do this.

If it's streaming down from **inside** the tailgate, it could be a sealing issue and we're working on a solution. We'll let you know when it's available. Until then, just follow normal troubleshooting procedures to find and fix the leak.
