

1. Turn ON the red battery rocker switch by the entry door in the 7 inch touch pad because that will turn ON your 12v components.
2. Go outside by the utility center and turn ON the LP switch. Your water heater is run by propane so if you did not turn this ON, your water heater will NOT work.

3. Still on the driver side, go to your water heater door and open it. You will see a rocker switch as well and that switch has 2 ON positions. One is ECO (top) and COMFORT (bottom). Press it downward to COMFORT.

4. Inside the coach, there is a remote controller for the water heater. 3 o'clock is OFF. Put it on 2 o'clock for comfort mode to operate. If there is still NO hot water, then the 5th step needs to be checked.

5. Just beside the furnace will be a wooden door. You need to open that access door to see the bypass valves at the back of the water heater. Sometimes the dealership always forgets to turn the bypass valves to the right mode because the coach is always delivered to them in winter mode and when you need to use it, it has to be in summer mode so that water will enter the water heater. You need to make sure that the bypass valves are the same as the right picture for you to have hot water.
