

1. I am not sure if you are dry camping or hooking up to shore power always. But if not, you need to make sure that you run your generator so that it will charge your house batteries because your solar panel is too slow to do that. Normally, it takes 5-7 hours to completely charge your house batteries without using anything if it's completely dead. If your house batteries are fully charged, it will read 14.5v-14.7v. Make sure that the red battery switch by the panel on the sliding door is ON when you are hook-up to shore power.

2. Please make sure that the solar controller under the power sofa in the back is ON. If you look at the upper left side of the battery, you will see an actual RED key inserted and that has to be "horizontal" in position. For you to know if this is turned ON, you need to try to pull out the key and if you cannot, it means it's ON. If the key is vertical, it means it's OFF and can also be pulled out. This "charge line disconnect" is responsible for your solar panel and alternator to charge your house batteries while driving and stationary.

3. Your 2000watt inverter (Freedom Xi) is responsible for operating your TV, DVD, microwave and all your receptacles. You need to make sure that your GFI's are reset because they are tripped that is why they are not operating. If you are hooked up to shore power, you need to press the reset buttons on your GFI at the galley/kitchen, GFI for the microwave and fridge for it to work again. Plug something in the receptacles after to see if it's working. For the inverter, you need to turn that OFF and ON to reset it. Under the driver side ottoman seat is your 110v distribution panel and you will see the inverter breakers there for the input & output and you may have to reset that too. The receptacles breaker is also in that area which you can also reset.
