

# SS 1033195 WST Doors Locking Immediately After Locking or Closing the Door

---

## SS 1033195 WST Doors Locking Immediately After Locking or Closing the Door

### Applicable Vehicles

All WST Vehicles with Remote Keyless entry.

### Symptoms

- When unlocked door is closed, the impact of the door closing causes the door to lock itself.
- Upon unlocking the door, the door immediately re-locks itself.

### Issue

The door lock rod is slightly too long, which causes door lock actuator to rebound upon unlock or closing the door. It rebounds just enough to lock the door again.

**The door can manually be unlocked, allowing egress.**

### Solution

The lock rod needs to be shortened slightly. Shorten by bending the rod slightly, as indicated below.

**WST door locks locking immediately after locking or when closing the door.**
