

There are 3 things to check for your Go Power controller:

1. Connection on the roof going inside the coach. There is a black entry plate for the solar panel that has wires threaded in to that plate. Please check if it's loose.

2. Inspect the back wires to the go power controller if the lengths are the specified length (pictures attached). There is a guide in the back of the controller (picture 2).

3. Please check the fuse inside the P/S sliding door (picture 3). You have to remove the fabric cover panel above which can be pulled right away because it's only held by Velcro. This coach has 3 solar panels so that fuse should be 30 amps.
