

### **De-Winterizing '18 Lexor TS**

1. Open the 3 low point drain valves located below the passenger side running board above the fresh water drain spigot.
2. Make sure the drain valve for the fresh water tank is closed. Fill fresh water tank through passenger side valve.
3. Turn ON the battery disconnect switch at end of galley. Turn ON the water pump on the 7 inch touch pad.
4. Open kitchen cold/hot faucet and let it run until all antifreeze is gone and water is running clear. Close the kitchen faucet and do the same with the bathroom lavatory faucet, bathroom shower, outdoor shower, and flush the toilet so fresh water will rinse the antifreeze in the toilet.
5. Close the 3 low point drain valves.
6. Open the door of the water heater outside the van. Pull down the yellow lever and insert the filter then push back up the yellow lever and close the heater door.
7. Unscrew the wood panel near the refrigerator to access the water heater bypass valves.
8. Open the valves on the white, red, and blue lines. This means the valve should be pointed in the same direction as the lines.
9. Close the valve where the blue and red line meets. This means the valve should be turned 90 degrees to the line. Screw back in the wooden panel near the fridge.
10. Drain the black tank but leave it open. Flush the black tank by draining the grey tank then close both drains.

### **Sanitizing Fresh Water Tank**

1. Pour 1/3 cup of bleach and 2/3 tank of water to the fresh water tank.
2. Drive the RV around to rinse inside and drain.
3. Fill the tank again with 2/3 water and drive the RV again to remove bleach inside and drain.
4. Do this plain water rinsing about 2-3 times to flush it clean.

Once you've completed the De-winterizing & Sanitizing procedure you can now use the Truma water heater.

It is NOT safe to run the bleach inside the Truma water heater as the bleach can damage the water heater's internal parts.
