Service Bulletin**

## General Information

Proper cleaning methods are important when servicing DEF line connectors to prevent damage to the connectors which will lead to leaks. Research conducted by VOSS determined the most effective methods for cleaning DEF quick-connect fittings. DTNA approves only the following methods for cleaning DEF quick-connect fittings.

- Steam jet cleaning to remove external dirt around the release clips
- Warm water for general cleaning and removal of built up DEF crystals
- Water based engine degreaser such Simple Green®, for areas with oil and dust buildup. Refer to SAE J2044 for more information.

Prior to assembly, flush the connector with clean DEF to insure a clean connection.

## Warranty

This bulletin is informational only. Warranty does not apply.
