

I put some arrows on the picture so that your tech knows what needs to be removed first in order to remove the black tank. Here are as follows:

1. Remove toilet.
2. Remove bar including partition where bar is attached. Just cut silicone to remove panel.
3. Remove aluminum frame around shower pan.
4. Remove step by entry door.
5. Cut the vent pipe behind the toilet. Just do it on the lowest part so that when you lift up the shower pan, you can slide it out.
6. Remove the shower pan.
7. Cut pipe underneath coach that is connected to black tank so you can lift up the black tank from inside.
