

Do the lithium ion batteries need to come inside for the winter? or is it good enough to turn off the disconnect? They don't have to, what you need to do is:

1. Please remove the red key at the back of the coach so the engine alternator and solar panel doesn't charge the house batteries in freezing temperatures as they can get damaged or shorten the lifespan of it.
2. Trip the 150 amp breaker inside the ottoman seat on the driver side in front of the power sofa before connecting to shore power so shower will not charge the house batteries in freezing temperatures.
3. When exercising the generator for ½ hour each month under load, when the generator is running, trip right away the 150 amp breaker so the generator doesn't charge the house batteries in freezing temperatures.
