

If you are not hooked-up to shore power, you need to monitor how many appliances/components that you are plugging in the receptacles because your inverter has a maximum capacity of 2000 watts. For you to be able to reset the receptacle GFI, you need to have 110v power going through the line. Please check if:

1. The inverter is ON and working (no Error codes).
2. Plug in to shore power or run your generator.

When there is 110v power, press test and press reset and check if there is power back on the receptacle.
